MAJOR CRONKHITE had only recently received the highest rating that his colonel had given any officer, and it is said that there were few men in the service whose rating was so high. His principal work was to weed out officers who, as a result of examinations, had been found not qualified to hold commissions abroad. It has been published that Captain Rosenbluth was marked just over the minimum considered necessary to "pass," and that the hike of this morning was to be the final test to determine whether he would be continued to command. Men of the battalion say that during the maneuvers, the major called the attention of Captain Rosenbluth to the fact that had he been handling his troops on a European battlefield, they would all have been wiped out.

Several hours later, Rosenbluth notified the major that the time for luncheon had arrived, and he suggested a location in a hitherto unfrequented part of the camp. Major Cronkhite went up an old, unused cart track to inspect the place. The battalion was halted, and the captain, accompanied by Sergeant Bugler Rolland R. Pothier, followed the major. These three men, now some 50 yards in advance of the column, were hidden from sight behind a wall of dense shrubbery.

Three or four shots rang out ahead. Ten minutes passed. The men of the battalion, made uneasy by the halt and the unexpected firing—for the order had gone out to take no loaded weapons on the march—looked over an adjoining fence, and tried to peer through the shrubbery. There ensued the silence of apprehension, no one knowing what had happened. Then came a call for a doctor. Three medical men went forward, and found Major Cronkhite lying dead in the arms of Captain Rosenbluth. He had been shot through the right breast.

The two sole witnesses to the shooting, Rosenbluth and Pothier, testified before a Military Board of Inquiry that the young major had shot himself accidentally while firing at a tin can set on a gatepost. But immediately after the officer's body had been taken to the base hospital, the 213th Engineers knew that his wound was not self-inflicted. The explanation had seemed incredible to them from the start, for it was inconceivable that a trained West Pointer could kill himself by accident while handling a revolver.

Cronkhite Uniform Burned

UNACCOUNTABLY, shortly after the major's death, his uniform was burned, thus destroying the evidence of powder marks and the direction of the bullet. The Department of Justice, not satisfied with the account given of the shooting, began an investigation which extended over many months. Major Cronkhite's body was exhumed, and Otto F. Schultze, professor of medical jurisprudence, medical college of Cornell University, after performing an autopsy, swore to the opinion that "the wound could not have been self-inflicted with a firearm in the hand of the deceased," and his opinion was corroborated by several leading gunshot experts.

Meanwhile, the two witnesses soon after left the service, one of them, Rosenbluth, going abroad, to Russia, Siberia and Turkey, where he remained for about a year and a half.

Two and one-half years after the shooting of Major Cronkhite, Pothier, the former sergeant bugler, was arrested on a Federal warrant. He admitted that it was a bullet from his gun that had killed the young officer, and he at once pleaded guilty to involuntary manslaughter before a United States Commissioner. Later he made a sworn confession, in which he stated that his fellow witness, Robert Rosenbluth, had instructed him to shoot the major. He detailed how he had borrowed a revolver from a sergeant, and had taken several bullets from the sergeant's bag. "It was wartime," said Pothier. "My captain told me to shoot Major Cronkhite. Orders are orders in the army."

Rosenbluth, who had returned from abroad several months before, was thereupon arrested in New York City. He denounced Pothier's confession as "a gross, stupid lie." He insisted upon the truth of the "tin can" story. He was at first quoted as expressing the belief that, while Major Cronkhite was shooting at a can placed upon a gatepost, a bullet was deflected and caused his death. Later, he asserted that the major had "a double-jointed wrist," and that his hand had twisted, so that the fired bullet entered his body.

But the parents of the slain young officer, and his comrades, had never noticed this alleged infirmity, and Dr. Otto F. Schultze, who had performed the autopsy, when interrogated on this point, said bluntly: "I have never seen a double-jointed wrist."

Two days after Rosenbluth's arrest, a group of wealthy New York financiers of his own race "interested" themselves in his case, and offered him their support. They offered bail for him in any amount, and he was released on their bond for $25,000. Under the terms of the bail bond, Rosenbluth was directed to proceed to Tacoma to answer charges in the Western District of Washington. At the hearing, an amended complaint was introduced, charging him with the premeditated murder of Major Cronkhite.

Rosenbluth, when first arrested, expressed his eagerness to return to Tacoma and face any charges. Ever since then, however, he has been fighting his extradition from New York to the state of Washington, by means of an expensive staff of lawyers who have been placed at his disposal.

A conference was now held in New York City by an organized racial group, which adopted the contention—but quite unreasonably—that the charge against Rosenbluth constituted a reflection on their race. They reached three conclusions. *The first was that Rosenbluth must not be permitted to return to Tacoma. The second, that a widespread publicity campaign should be instituted, to convince the American public that Rosenbluth was being made the "victim of race prejudice."* The third conclusion, and the most important, was *the urgent necessity for casting discredit upon Pothier's confession.*

In the execution of these designs, they made use of a newspaper publication, owned by members of their own race, and which for decades has been at their service in such emergencies.

"Inside Stories" and the "World"

MANY years have gone by since old Charles A. Dana directed his editorial thunders against the "School for Crime under the Brass Dome" of the Pulitzer Building. Mr. Dana felt that the New York *World* did not live up to the ethics and traditions of American journalism. The *World,* however, has thrived exceeding well in appealing to the tastes and predilections of New York's East Side, where it obtains a large and profitable circulation.

It has been the traditional policy of the owners of the *World* to feature some member of their race, prominent in public life, who could deliver "inside stories" on important events in return for favorable publicity. In the old days, the *World* thus favored a then prominent New York lawyer—Edward Lauterbach. But Lauterbach became involved in a disgraceful episode with a notorious character of the underworld—"David Lamar, the Wolf of Wall Street." Lamar was sent to a Federal prison, and Lauterbach was censured by a high judicial tribunal. The *World's* owners then centered their attentions upon another corporation lawyer.

Some years ago, while leaving a Wall Street office building in the company of Samuel Untermyer, the latter confided to me that he considered the New York *World* the greatest newspaper in the country. The admiration is evidently mutual. The *World* features Mr. Untermyer in its cartoons, "plays him up" in its editorials, and stands ready to boost him for any public post he may desire. In return, it gets its *quid pro quo.*

Attention will be devoted subsequently to a series of attacks, published under the signature of Robert Rosenbluth, which were launched against the Department of Justice, and in which intimations were made that if the proceedings against him were not dropped, his defense would be undertaken by a "great constitutional lawyer," Louis Marshall, and steps would be taken to impeach the United States Attorney-General. The firm used to be Guggenheimer, Untermyer & Marshall. Old Mr. Guggenheimer died many years ago, but his remaining partners are very much alive. Rosenbluth's predictions have been partly fulfilled. Samuel Untermyer, whose promotion of the Strawpaper Trust was condemned by the venerable Vice Chancellor Pitney as of an "intrinsically fraudulent character" (Court of Chancery, State of New Jersey, April, 1905), has threatened to impeach the Attorney-General, while Mr. Marshall, head and spokesman for the American Jewish Committee, with a numerous staff, is fighting Rosenbluth's extradition to Tacoma.

Shortly after Pothier's confession was made public, groups of politicians and officeholders, whose New York careers are dependent upon racial support, undertook pilgrimages to Washington, D. C., where they were engaged to use all the influence at their command in convincing the Attorney-General of the innocence of Captain Rosenbluth. It is a significant fact that, on April 22, 1921, the *World* quoted one of these politicians as giving the first intimation that "Pothier had retracted his confession."

But the *World* did not begin its operations to discredit the confession until several weeks later. It is probably the only morning newspaper in New York that would have been willing to tamper with a government witness in a case of this kind.

Here is the gist of the *World's* story, as published May 23, 1921:

Pothier has completely repudiated his confession, in the story he has told the *World.*

Pothier was found by the *World* reporter in Central Falls, Rhode Island, just out of Providence, where he and his wife live. He is a short, stocky man, of French-Canadian descent, 28 years old, with a dark complexion. His manner is resentful.

Pothier said: "Lee and Callaghan picked me up and asked questions. Finally I came out and told them that it was my gun that did it. I told them that I was emptying cartridges out, and it went off.

"Later Lee came with Father Liberté, the priest in my church out in Central Falls. They had me in Howard Prison. Lee left us alone and Father Liberté told me I'd better tell the truth about everything and I admitted to him I'd killed the major accidentally."

Pothier continued that Lee, Callaghan and United States Attorney Vannon came with a stenographer and he told them the story "because I was sick of being pestered all the time." Then he signed the confession.

No Retraction Exists

"THEY took me to New York and to police headquarters, under the name of Joseph Brown. The next day I told them I wasn't going to stick to that confession about Rosenbluth."

Everything having now been accomplished according to schedule, the next move in the case was to have been expected. Jonah J. Goldstein, of Goldstein & Goldstein, then attorney for Robert Rosenbluth, made a demand upon Colonel Francis G. Caffey, at that time United States Attorney for the Southern District of New York, for the discharge of Rosenbluth's bail, presenting an affidavit in which he alleged, on information and belief, that the statements in the New York *World,* concerning its investigation of the case, were true. Colonel Caffey refused to accede to this demand. Mr. Goldstein was informed that a sworn statement in the possession of the Department of Justice was a very different matter from a conversation alleged to have been obtained by a newspaper reporter.

The truth of the matter is that there is not in existence a retraction of Pothier's confession.

Recently I went to Providence to see Mr. Davis G. Arnold, who has been counsel for Pothier ever since the latter's first arrest. I asked him: "Has Pothier ever retracted his confession?"

Mr. Arnold replied: "Yes—to me. But I have never officially filed a retraction with the Department of Justice. They have no retraction from Pothier."

"How about the New York *World?*"

"The *World,*" said Mr. Arnold, "sent me word that they wished to interview my client. Their man came to Providence, and he saw Pothier in my office, while I was present."

"Do you think there is any race prejudice against either Pothier or Rosenbluth?"

The lawyer's reply was: "I don't know what the people in New York base their contention of race prejudice upon. But personally, I don't believe any question of race prejudice enters into the matter."

"Mr. Arnold," I said, "I would like you to give me an opinion of your client, Pothier."

Pothier Not a Defective

"WELL," he replied, "Pothier is not defective, in the sense that he is not responsible for his acts and statements. But he is of low mentality. *He is easily led, and responds to suggestions.* He's in jail now. I have told him that I would resign as his counsel if he talked any more. *Pothier thinks that a bullet either from the major's gun or from his own gun, caused the officer's death. I don't believe he knows which.*"

There appears to be more than a mystery in the Rosenbluth-Cronkhite case. There are grave and serious discrepancies that demand explanation.

The first article of this series presented the exact testimony of former Captain Rosenbluth and Pothier, the sergeant bugler, as taken shortly after the shooting of Major Cronkhite. It will be recalled that Rosenbluth testified that he was standing close beside the major when the latter fired the second and third shots at a tin target on a gatepost, and that the third shot caused the officer's death. Pothier's testimony was to the same effect. But Pothier has since pleaded guilty to involuntary manslaughter, on the admission that it was a shot from his weapon that killed the major. This pleading is independent of the authenticity of his sworn confession incriminating Rosenbluth. Pothier also confessed to Father Liberté that his bullet killed the major. And Pothier's counsel, Mr. Arnold, says

The Background of the Story of Evangeline

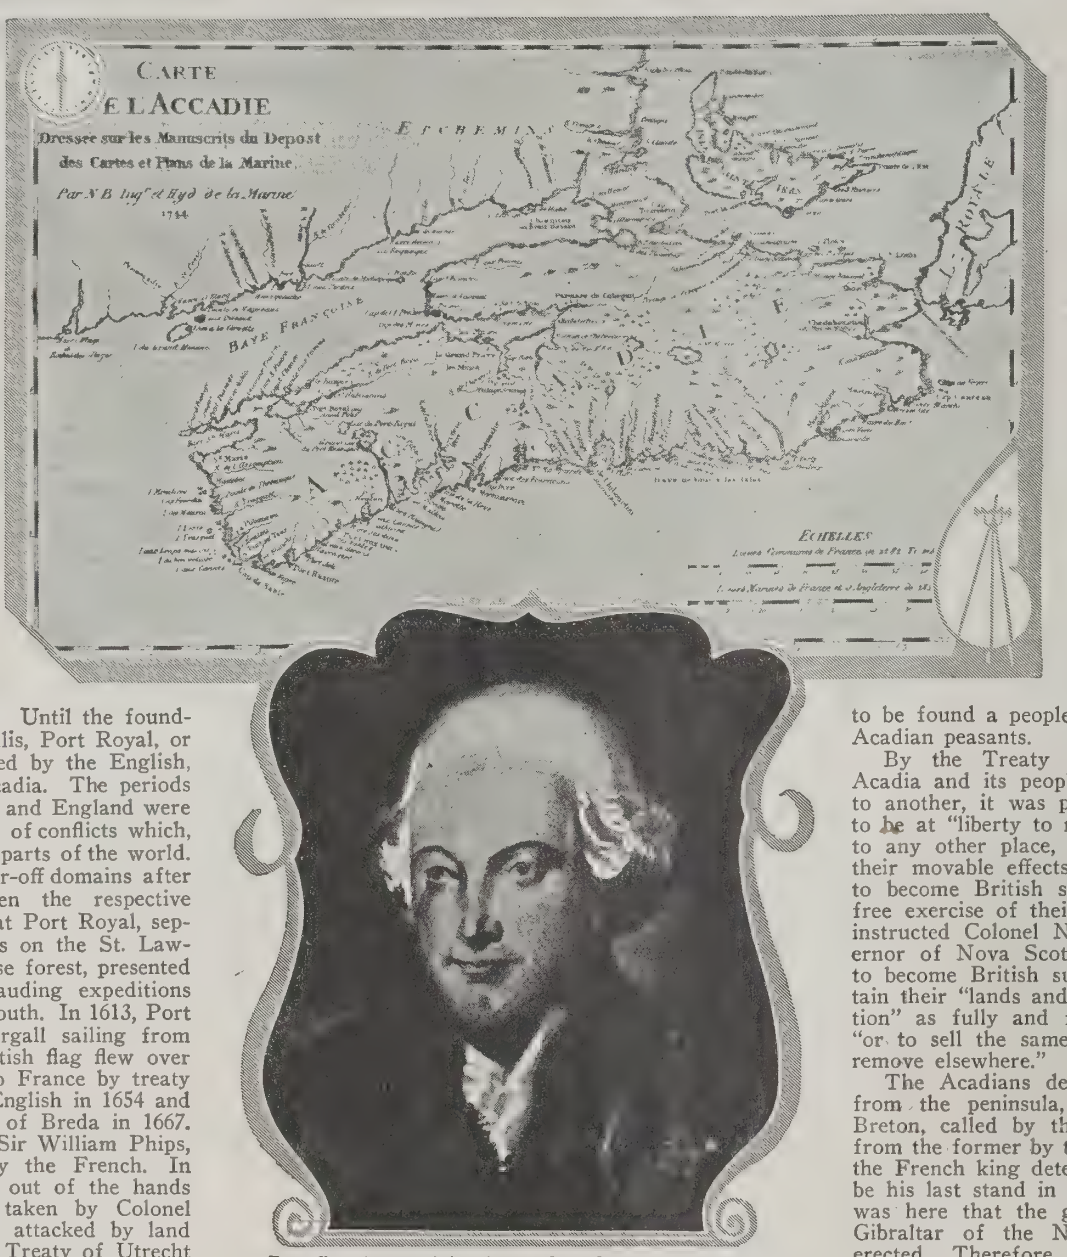
Longfellow Poem Typifies Accurately Experiences Acadians Suffered

By D. M. LE BOURDAIS

IT WOULD be hard to say whether, in his Evangeline, Longfellow had immortalized the tragic story of the expulsion of the peaceable and home-loving Acadians, or whether the latter had immortalized him; but it is more than probable that millions of people the world over, to whom history as it is written is more or less a closed subject, owe what little they know of this tragic episode in the life of a people to the beautiful idyl which is known and loved wherever the English language is spoken. There is little doubt that numerous actual cases existed such as are typified in the experiences of Evangeline Bellefontaine and Gabriel Lajeunesse; while historically the poem is essentially accurate.

The territory known to the early French settlers as Acadia comprised what now constitutes the provinces of Nova Scotia, New Brunswick, Prince Edward Island, and parts of the province of Quebec and the state of Maine; but the name is more generally associated with the peninsular portion of the province of Nova Scotia.

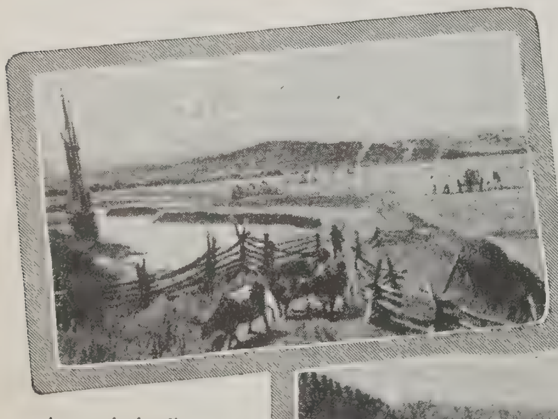
Colonization was first undertaken successfully in Acadia in 1604 when the Sieur de Monts established a settlement called Port Royal on the southern shore of, what later became known as the Bay of Fundy. Until the founding of Halifax in 1749 by Cornwallis, Port Royal, or Annapolis Royal, as it was renamed by the English, was the seat of government in Acadia. The periods when peace reigned between France and England were but breathing spaces in a long series of conflicts which, begun in Europe, were waged in all parts of the world. Quite often hostilities continued in far-off domains after peace had been restored between the respective courts. The struggling settlement at Port Royal, separated from the French settlements on the St. Lawrence by hundreds of miles of dense forest, presented an irresistible temptation to marauding expeditions from the English colonies farther south. In 1613, Port Royal was ravaged by Captain Argall sailing from Virginia and for 19 years the British flag flew over the capital of Acadia. Restored to France by treaty in 1632, it was recaptured by the English in 1654 and returned to France by the Treaty of Breda in 1667. Again in 1690 Port Royal fell to Sir William Phips, but was subsequently regained by the French. In 1710, however, Port Royal passed out of the hands of France forever when it was taken by Colonel Nicholson, of New England, who attacked by land and by sea. Three years later the Treaty of Utrecht gave all of Acadia "within the ancient boundaries" to England. The French contended that the territory ceded comprised only what is now the peninsular portion of Nova Scotia; while the English claim extended to the St. Lawrence River.



CARTE
E L'ACCADIE
Dressee sur les Manuscrits du Depost des Cartes et Plans de la Marine
Par N B Ingr et Hyd de la Marine
1744
BAYE FRANÇOISE
ECHELLES

Early French map of Acadia and Gov. Charles Lawrence, the man responsible for the tragic eviction of its inhabitants.

At the time of the cession the population of Acadia was approximately 2,000, most of whom were descendants of the settlers in the early years of the preceding century. Owing to the indifference of the French court, colonization had been greatly neglected. By 1671 there were only about 400 settlers in Acadia, three-fourths of whom were at Port Royal. But as their numbers increased, necessitating the subdivision of lands to the point where further division was no longer practicable, they began to remove to other places favorable for settlement. The most populous of these developed on the shores of the Basin of Minas, where were the villages of Grand Pré, Riviere aux Canards, Pigiguit, and a great many smaller communities. At Cobequid, now Truro; at Beaubassin, now Amherst, near the head of the Bay; and at Petitcodiac and Memramcook, north of the Isthmus of Chignecto, other settlements were established.



A scene in Acadia.

Agriculture was the principal industry. The salt marshes, won from the sea and protected by dikes against the famous tides of the Bay of Fundy, were wonderfully fertile: fruits, vegetables and grains grew in abundance; the undiked marshlands and uplands provided luxuriant pasturage. The men were expert and thrifty husbandmen. The women took pride in the arts of the home; on spinning wheels and looms they spun and wove the products of the flax-crop and the wool-clip.

Communication between different settlements being difficult, each community became more or less autonomous. There were times when the settlers at Minas or Cobequid hardly knew whether the English flag or the French flag flew over the ramparts at Port Royal. And what is more, they were not greatly concerned. They held strongly to the religion and the traditions of their fathers. They paid homage to the French king, but in reality France and the Bourbon dynasty meant little.

Life tended as well to become communistic: there were none very rich, though many were well-to-do; and poor were unknown. Longfellow is not indulging in poetic license when he says:

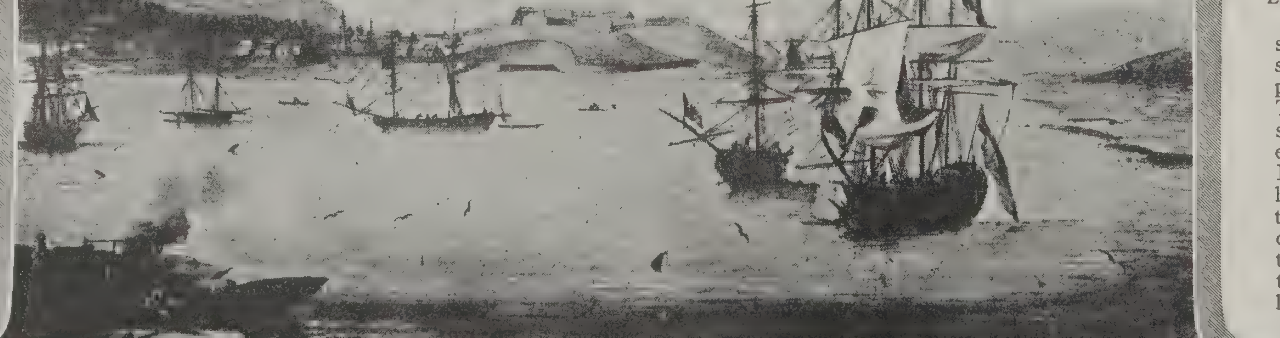
> "There the richest was poor, and the poorest lived in abundance.
> "All things were held in common, and what one had was another's."

Education as it is known today hardly existed. Still in the documents of the period that have been preserved few names were signed with a cross. The curé was their spiritual and temporal adviser. The notary drew up their agreements and kept their legal affairs in order. Most of their disputes arose out of the necessity for the division and subdivison of lands among the many children of the large families. Of serious crimes, the records contain hardly an instance. Nowhere was there to be found a people as happy and contended as the Acadian peasants.

By the Treaty of Utrecht, which transferred Acadia and its people from one European sovereign to another, it was provided that the Acadians were to be at "liberty to remove themselves within a year to any other place, as they shall think fit, with all their movable effects." But those who were willing to become British subjects were to be allowed the free exercise of their religion. Queen Anne further instructed Colonel Nicholson, who had become governor of Nova Scotia, that those who were willing to become British subjects should be allowed to retain their "lands and tenements without any molestation" as fully and freely as other British subjects, "or to sell the same, if they shall rather choose to remove elsewhere."

"Evangeline"

The Acadians decided to move. France, driven from the peninsula, still held the island of Cape Breton, called by the French, Ile Royale, separated from the former by the narrow Strait of Canso. Here the French king determined to make what proved to be his last stand in the territories of Acadia; and it was here that the great fortress of Louisburg, the Gibraltar of the New World, was shortly to be erected. Therefore, every inducement was offered to the Acadians to emigrate to Ile Royale. The latter, on their part, sent emissaries to investigate the nature of the land and the conditions of life which they should have to assume in their proposed new home. The report does not seem to have been entirely favorable. Indeed, it would have been difficult to find natural conditions as ideal as those in the land they were asked to leave. And why should they leave?



A view of Annapolis Royal in Nova Scotia, made in 1751.

Our Newspaper Men Become "Journalists"

Except for Desk Cats There Are Few Frock Coats and Canes to Be Seen But the True Reporter Type That Gets the News Seems to Be Vanishing

By LEWIS HARPER

"JOURNALIST" is a word that American newspaper men never apply to themselves except in raillery. For outsiders—folk who believe that reporters carry notebooks like they do in the movies—the word may be all right. Occasionally an ancient editorial writer—usually one who was never a reporter—may employ the word otherwise than in banter, but even this is rare and mostly rural.

Consequently I expect some brickbats for writing this "story" which will be an "article" to most of those who read it—because I am going to say and try to prove that American newspaper men are fast becoming "journalists," owing to the new tendencies in the newspaper game.

Of course, American "journalists" do not wear frock coats, like the pictures of European journalists disclose. Only a few desk cats, mostly dramatic critics and that sort, even dare affect a cane and Windsor tie. To the he-reporter these are something even worse than "journalists." No American correspondent has ever yet started a story from Washington like this one from London, "I saw Lord Sydenham last evening and he informed me——," but for all their Anglophobia, the Hearst papers now feature the personal pronouns and opinions of Mr. William Hard. Washington correspondents are getting a lot of phrases out of the American weekly edition of the Manchester *Guardian*—witness their use of "die hard" in the rail strike stories last summer. Incidentally, it was the "die hards," in the strike over here and the election over there, who didn't do the dying—so this little imitation of British journalism has implications, aside from those of diction, as to the reportorial ability of the advanced "journalistic" wing of American newspaperdom.

Industry Rests on Reporters

OUR whole newspaper industry rests finally upon *reporters.* The product of newspapers is *news.* Reporters furnish the material. The other processes of manufacture are incidental. What kind of newspapers we are going to have will be determined not by publishers, editors, advertising men, mechanical men and processes—*but by what kind of reporters is available.* American newspapers have been distinctive and in many respects superior, because the American reporter has been a type—if not unique—certainly different, from the prevailing type elsewhere.

An American newspaper man was sent to Paris to cover the Dreyfus trial for a chain of newspapers that had no European connections at that time when foreign news was relatively unimportant. He advertised in the Paris papers for a reporter—or thought he did. Next day his suite at the hotel was crowded with stately or vivacious gentlemen wearing top hats and long-tailed coats. They were all critics, editors, leader writers, book reviewers—"journalists"—exactly what he had advertised for. He was in Paris for several months but he never found a reporter. When he told me this story some years ago he said that he had seen more "journalists" at that hotel than he had seen in the entire United States. Leaving out the costume, I believe he can find quite a crowd over here today.

The vitally important characteristic of the true reporter is *ruthless impersonality,* which leads to the sacrifice of all personal views, preferences and temperamental bias in seeking and writing facts.

Naturally, the laws of mental symmetry associate with such a characteristic others which contribute to the type—such as coolness, quick thinking, courage and persistency.

The true reporter is ectrospective in that he seeks adventure, analytical in that he understands human nature—even natures with which he has little or nothing in common.

The Rewards of Service

THE reporter type is usually more interested in the game than in the proceeds. Shortsighted publishers who have noted this have kept the rewards so low that recruits of the right type are becoming scarce. While reckless of self in the pursuit of news, the reporter is individualistic. When reporters are seen hunting in packs, it is an unfailing sign of bad reporting and an inferior staff. The very life of the game is in the rivalry—"scoops"—and when men say that scoops are becoming rarer, they admit right there that reporting is on the decline and that newspaper men are becoming "journalists." Now this individualism of the reporter, at a certain point, will check his passion for the game, and if pay is kept *too low* and promotion *made too slow,* the right types will leave the business—or not enter it at all. Today reporters' pay is higher than formerly, but still the average is not far above the salary of the unionized mechanical employe. The ad salesman gets better pay. His is a sort of ability that can be picked up anywhere. Real reporter talent is not only rare, it tends to become more scarce as American life gets away from the self-help of the pioneer and approaches the automatic specialization toward which civilization is marching.

As reporters are replaced by "journalists," newspapers will tend to become "journals." When the American reporter has become extinct, the American newspaper will also join the Great Auk and the Dodo. It may look the same but it will not be.

Are reporters becoming scarce?

I believe they are—and I know American newspapers are losing their grip on their readers—the last election returns in many states disclose that the voters are in most states going strong in the other direction from the editors. I believe this is because the newspapers are becoming journals and reporters are becoming journalists.

Two years ago I had occasion to talk to a good many managing editors and city editors from Cincinnati to Los Angeles. While they were not unanimous, the general run of comment was something like this: "Why don't we get good reporters any more? Have they stopped raising them?"

"Willie Boys" of Today

CUBS were scarce, although in every office one or two of the old quality were reported—frequently lads who had started in as office boys on the paper. Some city editors talked this way: "I am through trying to train cubs. All we get now are a bunch of willie boys—generally from schools of journalism—who want to start in on salaries that an editor used to be glad to get. One story a day is their idea of output—why, we used to hustle 'em all day, now they want to play golf after the Home edition has gone to press."

In many cities it was evident that only experienced men were being given jobs—old, hard-boiled men were in demand and staffs were often being reduced in size. Fortunately, the suspension of many papers supplied veterans for the time being, but the ever-growing army of press agents and publicity men is absorbing the old-timers.

Some city editors blamed the public schools. They said that the average cub nowadays never knows anything about the geography of his own state, scarcely anything about local governments. Few know the difference between a county and a congressional district—most of them never heard of a judicial circuit and all without exception have the idea that the Federal Government has power to intervene in any sort of situation.

Here and there the schools of journalism were rapped and rapped hard. Perhaps this is the prejudice of the men who learned the game when there were no such institutions. There is certainly a suspicion abroad that the schools of journalism are too true to their name, and are turning out "journalists" only.

Other theories were aired. Some thought that the complaint was all based on the natural tendency of old-timers to sigh for the "good old times" and paint the past in rosier colors than it deserved. Others thought that American youth is becoming effeminate—and reporting is mostly a man's game. The growth of socialism, and the epidemic of work phobia which accompanies it were cited by others. Perhaps there is truth in all these diagnoses.

But little was said about the newspapers themselves being to blame. I have cited their failure to make the reporter's pay attractive. In addition to that I believe they are destroying the news atmosphere in which the reporter thrived best. As newspapers become "journals" they will, of course, become less congenial to newspaper men. Now just as the primal characteristic of the newspaper man is *impersonality,* so the distinctive characteristic of the newspaper, as contrasted to the "journal," is impartiality.

Newspapers today are becoming more and more vendors of views rather than news. When it is not the views of their proprietors, it is the propaganda which is pumped into them from a myriad sources. I know that this is blasphemy of the deepest dye against all the idols in the modern editorial Pantheon. Now, as never before, do newspapers parade their impartiality and independence. They decry the partisanship of the party organs of the past. How many thousands of times have editorial writers told us that the old partisan paper was a thing of the past.

Editorializing Our News

NOW it so happens that this is *true of technical party politics,* but not otherwise. The *editorial pages* are more impartial and independent—even the news columns are freer of *political* bias. But while the partisanship of the editorial pages has declined the news columns are becoming editorialized. Propaganda is subtly diffused throughout the news columns. This is not true of all newspapers. Certainly not. But it is true of an increasing number and is a growing tendency in the papers which make an especial appeal to the mass of the people.

The tendency of rich men like Hearst and Munsey to buy up newspapers—although both may claim to be newspaper men everybody knows that they have other interests—is not conducive to the running of newspapers as newspapers only. Many newspaper properties built up in the last generation by men who were newspaper men only and were heart and soul in the game, have been inherited in recent years by young fellows who did not get their views of life in a newspaper office.

Compare the treatment of public questions a generation ago—with a typical Hearst "campaign" for ship subsidy or for beer and wine. Note how every news story on the chosen subjects for weeks is written in hortatory style. See the flocks of interviews piled into the paper in behalf of the chosen policy.

And Hearst is only the biggest—his imitators from whom he got his best hunches, are too numerous for anything shorter than a catalog.

What does the great array of "signed stories" in the newspapers mean? Merely window dressing? Sometimes it is a device to reward a reporter without having to raise his pay or give him a bonus. But by and large the increasing use of signed stories is a method to obtain more editorializing in the news. When a signature is placed over a story, it is a subtle method of disavowing a part of the responsibility and this gives freer reign to bias and argument in what purports to be a news account. The same thing is true of the increasing number of special correspondents and special news services. These are not fettered by the iron-clad rules of the Associated Press against opinion stuff.

Although the Associated Press was never more efficient, faster or more reliable than it is today, many of its clients use less of it than they ever did. They are willing enough to pay for it, because it is an invaluable check on the accuracy of their other stuff, but it does not carry the "color" and "sparkle" of the special correspondents.

But what are the "color" and "sparkle" if not "journalism"—the injection of personality—the very antithesis of old-school reporting? The signed stories, whether of the local staff or the correspondents, veer away from the reporting ideal the moment they are signed, for the signature is the beginning of the end of impersonality.

"Coloring" Wire Reports

THAT "journalism" is supplanting newspaper work is evidenced by the growth of two rival wire services, neither fettered by the rules of the Associated Press—and the rules of the Associated Press were evolved from the rules of editing and reporting as practiced in the best newspapers of that day.

One of the big wire services today got its great start to prosperity from its reports of a strike some years ago. The chief executive of the service openly declared that he did not claim that his reports were "uncolored"—contending that it is impossible to be impersonal and that *live* news must reflect the personality of the news gatherer. It needs no metaphysician to see where this doctrine will lead, if carried to its logical conclusion. It may be true that absolute impersonality is impossible, but accuracy will never be attained by giving rein to it. If news is to be true, at least the *effort* must be made to make it impersonal. All scientific experiment must allow for the personal equation, but every effort is made to eliminate it.

Another great wire service is the personal property of William Randolph Hearst—its principal product at times is sex, on which Mr. Hearst has, of course, no propaganda to offer, but when public policy is the news subject, the news of this service has a definite slant. If the slant is not definite enough, the local representative gets an assistant from New York.

A good test of how far a newspaper has progressed toward being a "journal" is afforded by the number of "dope" or forecast stories and "situation" stories it prints. The old type of newspaper man instinctively distrusts the dope story, the speculative yarn and the prediction. Situation stories, describing how things are "lining up," are nine times out of ten full of propaganda. It is easy to tell stories of this type from "spot" news things that have *happened.*

"Predicting" for the Boss

THE situation story is usually an editorial in disguise—thin disguise at that. But their popularity is increasing. As to prediction stories, this much can already be said, more of them are written with an idea of predicting what the boss hopes will happen, than to protect the prophet's reputation.

I have in mind a certain publishing concern which in 1919 sent a man out in the Northwest to write the state of the country and get a line on political opinion. He reported that the strikers would defeat Judge Gary and the steel trust, that the Non-Partisan League would sweep all the states of the Northwest, that John Fitzpatrick on the labor ticket would defeat Thompson for mayor of Chicago and that the League of Nations would win at the polls. For these remarkably successful predictions the writer, who knew what his employer wanted to hear, was promoted to a foreign correspondence job which he desired. He has it yet.

Other men who sent in stories which were afterward confirmed by events were "bawled out" for writing speculative yarns, and some of them had their dispatches changed, and read stories under their own signatures which were the reverse of what they had sent.

These men worked for gentlemen who own several increasingly prosperous newspapers—no, they're *journals*—owned by journalists, not newspaper men, and it won't be long before they'll be manned by journalists, not newspaper men.

There were a lot of buffaloes all over the prairies 40 years ago. Now there are a few in the parks. There'll be some American newspapers 50 years from now—in the museums.

The Great University Down-state in Illinois

What It Means to Train 10,000 Students to Be Better Americans

By GEORGE H. DACY

ON MARCH 2, 1868, when the University of Illinois—then called the Illinois Industrial University—opened, the faculty consisted of one regent and two professors; the student body was composed of 77 young men. At present there are more than 1,465 persons on the payroll of this institution—987 are on the teaching and administrative staff and 481 comprise the clerical, stenographic and labor staff. The total student registration for the school year ending June 16, 1922, was 10,627, who attended the 12 colleges or were enrolled for the special summer school courses.

Illinois, although progressive in settling her virgin prairies and formulating a durable state organization, was the last state in the Northwest Territory and Corn Belt groups to establish a state university. Michigan, Minnesota, Wisconsin and others had founded schools and were turning out graduates before Illinois legislators—largely through the efforts of Mr. J. B. Turner—established the University of Illinois in Champaign County about midway between Chicago and St. Louis. Although it was the last of the Corn Belt universities to find inception, the Champaign school has developed until it has outstripped all its Middle Western rivals. Last year there were only two educational institutions—the University of California and Columbia University in New York City—which surpassed Illinois in size and student enrollment.

Our state universities are outgrowths of the Morrill Land Grant Act by which the national government donated to each state public land script, in quantity equal to 30,000 acres for each Senator or Representative in Congress, "for the endowment, support and maintenance of at least one college whose leading object was—without excluding other scientific and classical studies and including military tactics—to teach such branches of learning as are related to agriculture and the mechanical arts to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." Under existent conditions, each state pays its state university interest semi-annually at the rate of five per cent on such endowment. In the case of Illinois the principal is approximately $649,000.

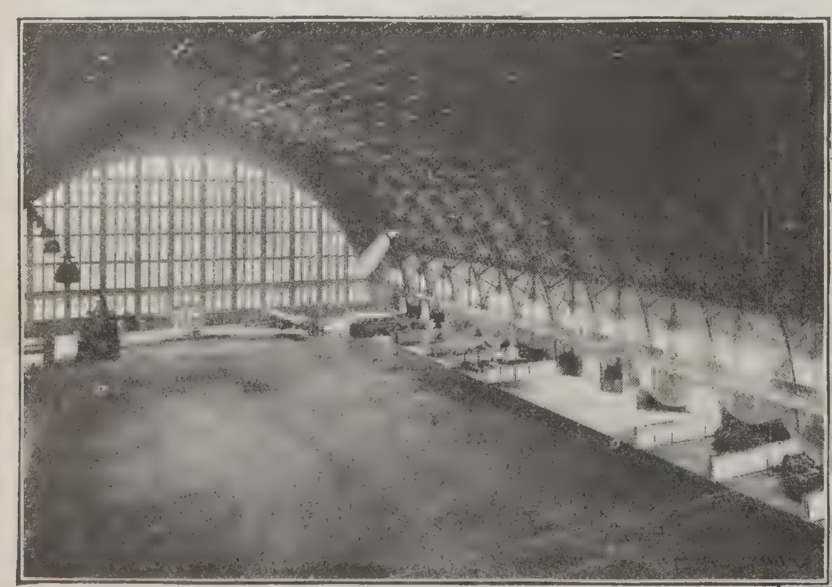
The early history of the Illinois Industrial University differs but slightly from that of the other Corn Belt colleges. During the first term instruction was given in algebra, geometry, history, physics, rhetoric and Latin. Work on the farm or gardens or about the buildings at first was compulsory for all but later was discontinued. Several years thereafter a mechanical shop was fitted with tools and machinery and the first shop instruction offered by any American university was given. The same year, the trustees voted to admit women as students. Since that time they have constituted from one-sixth to one-fifth of the total number of students. As the school developed the departments of pharmacy, the college of medicine, school of music, library school, colleges of law and dentistry, school of business administration, school of education, state geological survey, school of railway engineering and administration, graduate school and department of mining engineering were added.

Since its establishment, the University of Illinois has graduated more than 20,000 students and is continuing this laudable educational work at the rate of 1,000 or more a year. In June, this year, 1,344 wearers of the orange and blue—the college colors—received their cherished sheepskins. To train students for a dozen or more technical and professional vocations as well as to equip others who do not specialize in their studies in the fundamentals of the letters, arts and sciences on the scale that is successfully and efficiently pursued at Illinois requires land area, buildings and equipment more extensive and complete than those found in many of the leading smaller cities. At this writing, the physical plant of the university comprises 60 buildings, a campus which covers 235 acres as well as an experimental farm of 990 acres.

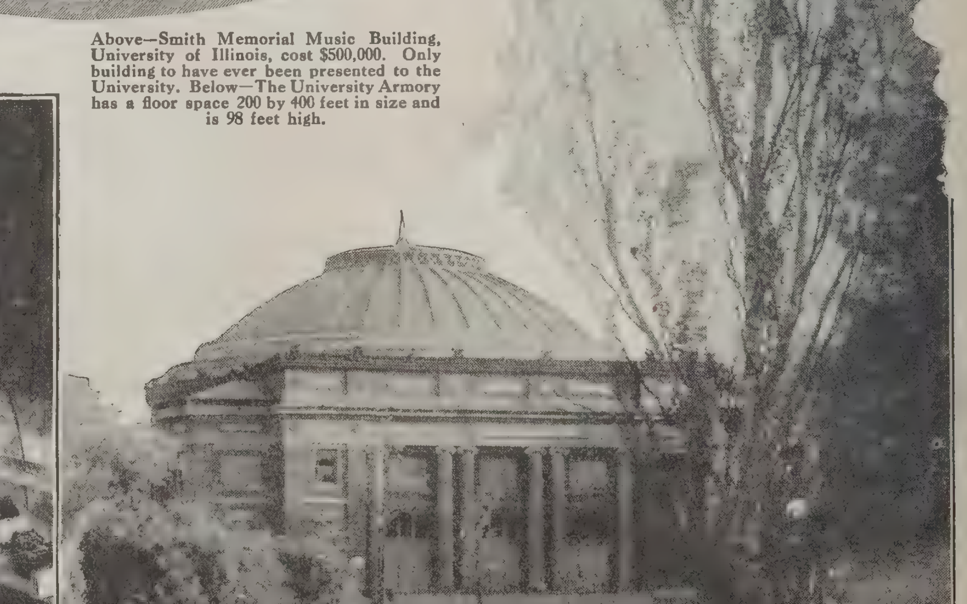
At the Twin Cities—Urbana and Champaign—which are the seat of this great institution of learning, 4,335 classes are held each week which cover the zone of all educational subjects from the intricacies of archeology and the complexities of machine design to the practical fundamentals of successful agriculture—the ability to raise profitable crops and to market the market-topping types of farm animals. As much attention is devoted to experimental and research work as to the outright instruction of the students. The ideal of the university is to be of constant utilitarian service to the state at large. That she satisfactorily consummates this ambition is evidenced by the fact that the University of Illinois has accomplished as much in the problems of coal production and coal conservation as any similar agency in the country while her timely work in fighting the Hessian fly, chinch bug, oat smut, flag smut, Take-all, Black Rot and other pests has saved annually millions of bushels of wheat, oats, corn, apples and other crops. The oldest lines of corn breeding in existence are still in progress at Urbana, 21 generations have been completed and four distinct kinds of kernels have been developed. A new process for manufacturing coke has been discovered recently which if commercially successful will add more to the wealth of the state than the total of appropriations which the university will receive during the next century. More than 10,000 samples of soil have been collected and analyzed from all sections of the state. This work cost hundreds of thousands of dollars but it will be worth millions of dollars to future generations of farmers.

The University of Illinois is now obtaining patents on "talking motion pictures" developed in its laboratories which promise to revolutionize the motion picture industry. Latterly, a new metal called illium has been produced at the university as a substitute for platinum. It excels the latter metal in many resisting qualities while it can also be produced at a much lower cost. Remarkable experiments relating to the efficiency and durability of car wheels and rails have been performed which have

Above—Smith Memorial Music Building, University of Illinois, cost $500,000. Only building to have ever been presented to the University. Below—The University Armory has a floor space 200 by 400 feet in size and is 98 feet high.



The armory, where indoor track meets are held on a track that is 6 laps to the mile.



The auditorium seats only 2,500 and is used for concerts and lectures. It is too small for convocation as the student body is more than 10,000.

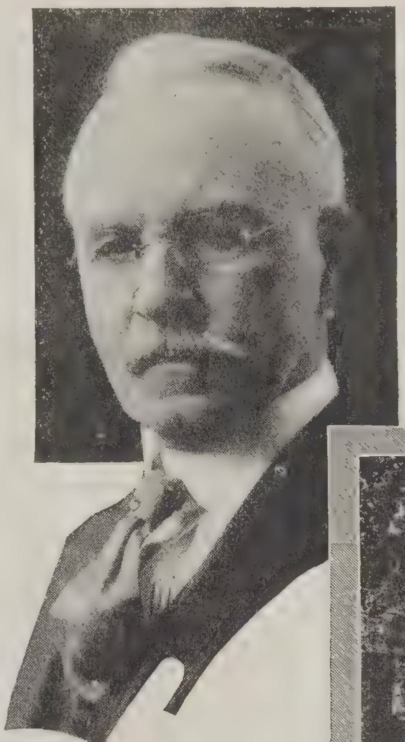
saved the railway industry millions of dollars. Outstanding and exclusive investigations concerning the fatigue of metals and the frictional resistance offered to currents of ventilating air in concrete tunnels have been of world-wide importance. Discoveries of engineering and agricultural importance have been made repeatedly and disseminated among the people of the state which in actual dollars and cents value are sufficient to justify the continuation and expansion of the institution for centuries to come.

The university carries its messages of science and its lessons of advancement and education into the homes, stores and shops through short courses in home economics, in agriculture, drainage, engineering and industrial education. Furthermore, it has been active in uplifting and improving the scholastic standards of the high schools throughout the state and in creating civic pride and developing community ideals. It is co-operating in an exhaustive forestry survey of the state which has as its program the establishment of a permanent forestry policy. From every scholastic and investigative angle it is tackling and solving involved and complicated conundrums and in every way possible is working for the upbuilding of the state through the university.

Many people think of a state university as merely a teaching institution—a sort of an enlarged high school. And just so many people are in error. Teaching is only one of the many features of a tremendous, complex and yet wholly efficient establishment like the University of Illinois. Such an institution is a clearing house for old and new knowledge, a forum for the discussion of present-day problems and an organization for the solution of these problems and for the discussion of new truth. It teaches the undergraduate students; it trains recruits for its faculty and executive staff; it undertakes investigation and research for the sake of correcting old beliefs and for the discovery of new facts with which not only to improve teaching but to advance the industries and refine the arts of life; its representatives attend meetings, conferences, conventions and conclaves where leading men meet and discuss questions of progress and at which the university's advice and assistance are sought.

When General John Pershing inspected the University of Illinois military brigade he complimented it as the best student organization that he had seen in the United States. It has the country-wide reputation of being the largest and best Reserve Officer's Training School in the world at this time. During 1922 as many as 2,900 students were enrolled in the cavalry, artillery, signal corps, corps of engineers, hospital corps and air service units of the university brigade. It was commanded by 200 student officers and consisted of two regiments of infantry, one of cavalry, one battalion of engineers, one battalion of signal corps and one observation group of the air service. The brigade is divided into 40 companies and 12 troops. Twenty-three regular army officers and 62 enlisted men are stationed permanently in quarters proximate to the university campus so that they can direct the military training of the student cadets.

The college armory at Champaign is the largest building of its kind in the world. It has the largest unobstructed floor space of any building in the country affording a clear area 200 by 400 feet in floor dimension and 98 feet high at the center for indoor military formations and tactics. This armory is so mammoth that the Chicago Coliseum intact could be placed inside the building and there would still remain sufficient space so that the brigade could execute all their drill maneuvers. Provision has been made for the addition of a balcony around the drill floor with seats for 3,000 spectators. The armory is used for indoor athletic meets and is so large that a dirt track six laps to the mile can be laid out. One hundred and forty-five artillery and cavalry horses are maintained and used in training the students while the total military equipment is valued at more than $2,000,000. During the last school year, 223 disabled veterans of the World War were given vocational training at Illinois University. Special courses in agriculture were offered for their benefit while they also were permitted to take any of the regular college work in the other departments where their educational training was sufficient to qualify them for such studies.



DAVID KINLEY,
President, University of Illinois.

Oval—Main entrance to the College of Agriculture.

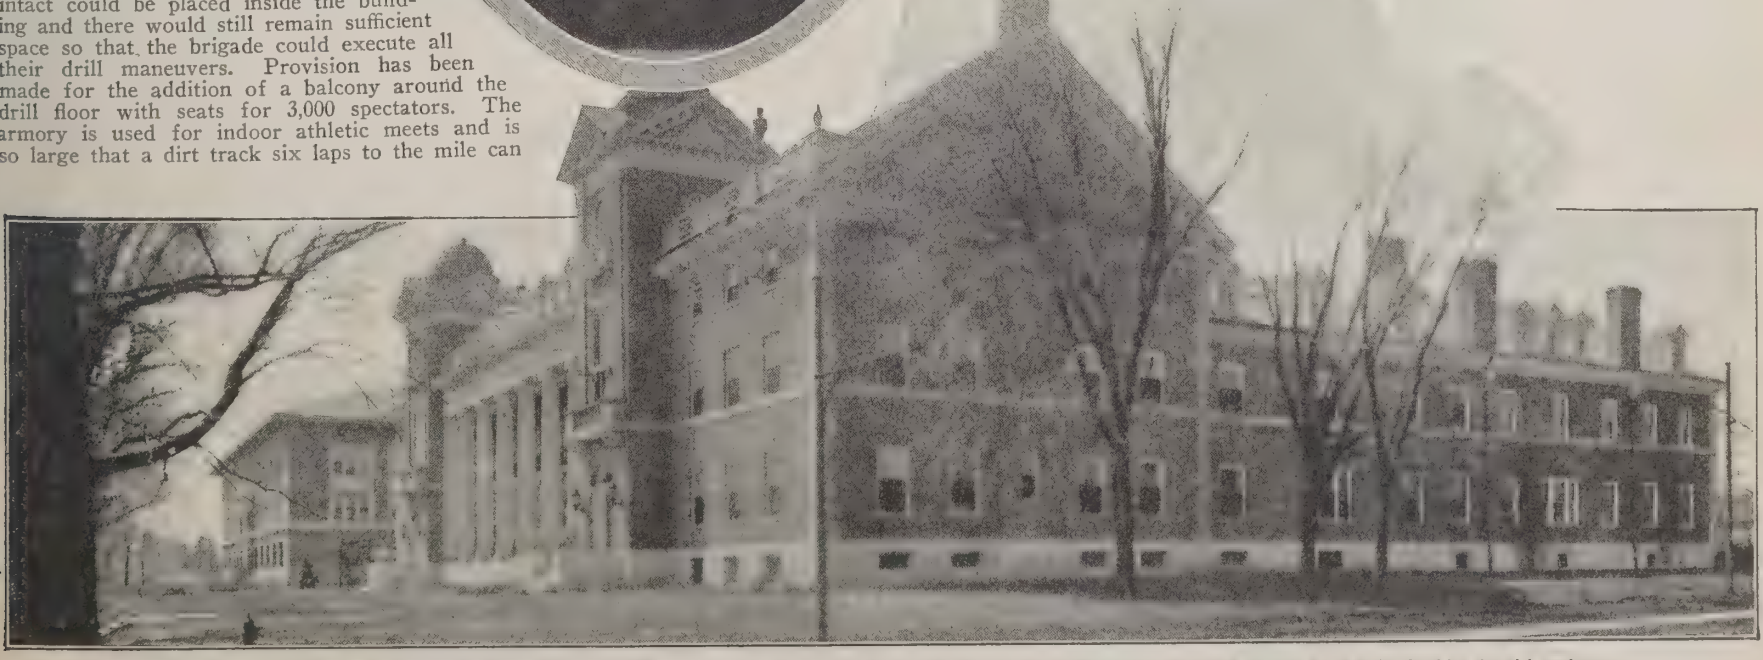
A logical outgrowth of the state university's inability—it is forbidden by law—to teach any form of religious doctrine is the development of sectarian religious centers at the University of Illinois, the first educational institution in the United States where such novel projects have been attempted. The Wesley Foundation, the social center and religious educational center of the Methodist church at the University of Illinois, is the first of these religious organizations to get under way. A social center, rest rooms, library, auditorium and religious educational rooms have already been constructed at an outlay of one-half a million dollars. A new chapel will soon be started while dormitories for the accommodation of the men and women students will follow. The Wesley Foundation has enrolled more than 2,500 students up to this writing and 6,600 students visited the buildings last year and used their facilities.

Regular classes in various branches of religious education are offered throughout the year. The University authorities keep tab on the character, quantity and quality of the work done—although they have absolutely nothing to do with the actual scholastic program—and give credit toward university degrees for the religious courses taken by the students at the sectarian centers. At present the Methodist organization is offering four special courses in religious education. Other churches and denominations are backing up the movement to develop religious centers at Champaign. The Catholics are well along in their campaign to raise $1,000,000 to develop the Catholic Foundation which already has been established. It will consist of five units comprising a chapel, social center building, religious education building and the dormitories and studies for the men and women students. When completed the buildings will cover one square block and will constitute one of the most beautiful quadrangles in the country. The Disciples are also raising a fund of $800,000 to establish a foundation, while the Episcopalians, Presbyterians, Baptists and other denominations are making similar preparations.

The athletic teams of the University of Illinois for many years have been leaders in all branches of intercollegiate sports in the Middle West. The student body has increased so and the crowds which attend the home games and contests at Urbana have become so large that the contracts have just been let for a new stadium to be one of the best and biggest ever built. Altogether, this new stadium will have a seating capacity for approximately 100,000 spectators. The first unit of concrete and steel which will accommodate 52,000 will be completed in time for the first football game of the 1923 season while the other additions will be finished as soon thereafter as time and funds will permit.

The administration of a large institution like the University of Illinois is a task that verges on labors as strenuous as those of the mythical Hercules. It is a big assignment to keep the 60 buildings in order and repair particularly when they are used by 10,000 students for about nine months of the twelve. Providing these buildings with adequate and dependable supplies of heat, light and water is fraught at times with great difficulty. Underground tunnels covering 6,568 feet for the distribution of heat, water and telephone service as well as 10,105 feet of conduit for the distribution of steam and 48,850 duct feet of conduit for the distribution of electricity constitute equipment which is as important as the laboratories and classrooms in the maintenance of so huge a state university. Heat for the buildings is supplied from six large boilers of 500 horse power capacity.

The consensus of opinion among eminent educators throughout the country who are intimately familiar with the slow, steady and successful development of the University of Illinois is that it will be pacemaker as the biggest American university within the next half decade.



The Woman's Building which houses the Home Economics Department. An interesting feature is a modern, model apartment which is managed and maintained by the girl students.

Inhale a Nail? Bronchoscopy Will Save You

Jefferson Hospital of Philadelphia Center of Such Surgical Work; Lungs Often Receive Foreign Bits That Do Little or No Harm

By WILLIAM A. M'GARRY

MAN must have air to breathe, and all health authorities are agreed that it ought to be as pure and free from dust and germs as possible. The truth is, however, that man—including women and children—can mix up his air with iron and steel staples, peanut kernels, gold, silver, brass, copper and tin articles, glass, porcelain, coal, bones, teeth, wool, hair, ivory, poker chips and pearl shell, breathe it into his lungs and keep on living with one of those foreign substances imbedded in the tissues for a quarter of a century or more, sometimes without feeling any ill effects. Then, if trouble develops, he can have the object removed and within a few weeks virtually all trace of its intrusion will have disappeared.

All that is possible mainly through the discoveries and inventions of a Philadelphia surgeon, Dr. Chevalier Jackson, who devised means more than 20 years ago for removal of foreign bodies from the lungs without the use of the knife and since then has been constantly improving on the original instruments. As the result of the success achieved the Jefferson Hospital of Philadelphia has become the world center of bronchoscopy. Its official records of thousands of successful operations show that small objects of almost every metal, mineral, animal and vegetable substance known have been accidentally inhaled by human beings and have been removed by instruments that enable science literally to see around several corners right down into the interior of the upper lungs.

Not Unlike Forceps

WITHOUT going too deeply into technical details with which physicians generally have been made familiar through the textbooks prepared by Dr. Jackson and his associates, it may be said that the instruments used are based on the principle of forceps. They are so designed that they can be inserted through the human gullet, into the bronchial tubes and the lungs. An X-ray plate is first taken definitely to locate the object which is to be removed. In cases where the object is so deeply imbedded that there is danger of collapse of the lung, caisson bronchoscopy is used. That is in some respects the most marvelous development of the science. As the name implies, it involves the use of a caisson similar in principle to the bottomless boxes used in building bridge and building foundations under water. The caisson supports the lung tissue while the object is being removed. Then it is cautiously taken out.

A point of interest in the 30 years' experience Dr. Jackson has had in removing obstructions from the lungs of patients is that the longest operation on record consumed only a little more than two hours. That was for the removal of a staple, made of iron, which had become deeply lodged in the lung and could be removed only after much expert manipulation of the instruments and the foreign object. Other staples, so inhaled that the points were upward, have been taken out in 20 minutes, and in the case of objects so shaped that there is little danger of tearing the tissues the removal is generally accomplished in a few seconds. The mortality rate is less than one-half of one per cent.

One of the remarkable facts brought to light in the study of the effects of foreign bodies in the lungs is that lung tissue which has become badly infected by reason of some foreign substance lodged in it recovers when the object is removed. That was shown particularly in the case of the woman who holds the distinction of having a "visitor" in her lung for a longer period than any other patient known. When she was a child she inhaled a glass collar button and it was not until 26 years later that the thing was discovered. During most of that time she had enjoyed fairly good health. Then septic toxemia set in, and she became so emaciated that she weighed only 98 pounds. Two years after the removal of the button she had regained perfect health and her weight had gone up to 182 pounds. The physical signs over the lungs, as shown on X-ray photograph, gave no indications of any abnormalities.

Chemical Changes Wrought

EVERYBODY knows nowadays that the human body is a complex chemical retort which operates day and night while life lasts. That is shown in bronchoscopy by the extent to which chemical changes are wrought on the articles accidentally inhaled. The lungs were never meant to absorb such things as iron, steel, bone and wood. They are not equipped for it. Yet once an article is lodged nature sets to work to overcome its effect. Iron and steel become badly corroded. In three cases it was shown that the corrosion destroyed the tensile strength of the metal, so that it crumbled into pieces when pulled on by the forceps. The bulk of the foreign body is quite frequently increased by corrosion. It has been found that the polish will disappear from blued-steel pins in two days in some instances, and corrosion starts in four days or a little less. Even galvanized coating on steel nails and similar articles disappears entirely in a year and a half. Nickel plating on brass disappears quickly, although brass itself corrodes more slowly. Copper corrodes quickly and deeply, but gold is slow to tarnish, as is nickel.

Dr. Jackson has found that the most dangerous thing to inhale is the kernel of a peanut. Experience in many cases shows that a peanut sets up the most prompt and violent reaction, and the younger the child the more severe the reaction will be. Unless speedy relief is given death may occur within a short time. The reason why that should be is now the subject of special studies being made at the hospital.

The most frequent site of lodgment of a foreign article in the lung is at or immediately below the giving off of the right, upper lobe bronchus, usually far enough below to permit air to enter the upper lobe bronchus over the top of the foreign body. The next most frequent site is the corresponding anatomical location on the left side, Dr. Jackson has found. Next in order of frequency is the stem bronchi, first the right, then the left. Dorsal branches of either side are more frequently invaded than the ventral branches.

"Failure of the protective mechanism contributes more or less to the entrance of almost all foreign bodies into the lower air passages," says Dr. Jackson. "This protective mechanism consists, in the case of the esophagus, mainly in the extrusive efforts of the tongue and a hawking, or screatus, the efficient part of which is chiefly a blast of expiratory air, differing from a cough in that there is no preliminary glottic closure. In regard to the lower air passages, the chief protective mechanisms may be considered in two groups: 1, the laryngeal closing reflex; 2, the bechic reflex. A foreign body entering the air passages must escape the vigilance of these reflexes, operating on and in conjunction with the anatomic structures. A foreign body entering the lower air passages must run the gauntlet of, 1, epiglottis; 2, upper laryngeal orifice; 3, ventricular bands; 4, vocal chords and 5, bechic blast. The failure of the protective mechanism may be due to 1, absence of certain anatomic structures; 2, paralysis; 3, impaired motility due to local or general disease, or 4, the holding in abeyance of the protective mechanism for the execution of some other cycle. An instance of the latter is the taking of a deep breath for coughing or sneezing.

Cough Often Causes Trouble

"THE most frequent manner in which an inedible substance gets past the protective mechanism and into the air passages, and thus becomes a foreign body, seems to be the following: The intruder is detected escaping downward over the dorsum of the tongue into or toward the pharynx. The tongue and muscles of the fauces and pharynx make a violent effort to catch and extrude the intruder, resulting in gagging, hawking, choking or coughing. These movements are followed by a sudden and deep inspiration. It is this inspiratory blast that carries the intruder into the lower air passages, the protective mechanism being held in abeyance by the co-ordination usual during the inspiratory phase.

"Cough is a factor not only by default in failure of expulsatory protective efficiency, but also by the induced sudden, deep, violent inspiration which follows severe cough. The cough which preceded the inhalation of the foreign body in some cases seemed to have been induced by crumbs of food or by minute quantities of secretion, or even of water, getting into the larynx. This seemed to be the case particularly with peanut kernels. Cough was given as a cause in the history of 82 out of 491 cases in which the history was sufficiently complete to have included cough, had it been stated.

"Carelessness in some form on the part of the patient or some one else seemed to enter more or less into the causation of 515 of the 590 cases of which there were sufficient records for the formation of an opinion. It goes without saying that when a child has an opportunity to put a safety pin in his mouth some one has been careless; likewise when a toothless infant is allowed to eat peanuts. Carelessness in the preparation of food is obvious when small fragments of bones are served in soups, stews, gravies and the like. Of course, the cook or the dealer cannot be blamed in case of the bones in fish or small birds, which are necessarily served with the bones normally in situ; but when bones are comminuted by the butcher using the cleaver instead of the saw, and the cook fails to remove the bone splinters, it is carelessness on the part of both butcher and cook. When the person eating the food gets one of the spicules of bone in his esophagus, it may be said that he is guilty of contributory carelessness in not searching his food for bones before eating. When, however, a person gets a bone in the esophagus while eating sweetbread cutlets, or croquettes, it may be said that the carelessness is wholly the cook's, or possibly the butcher's."

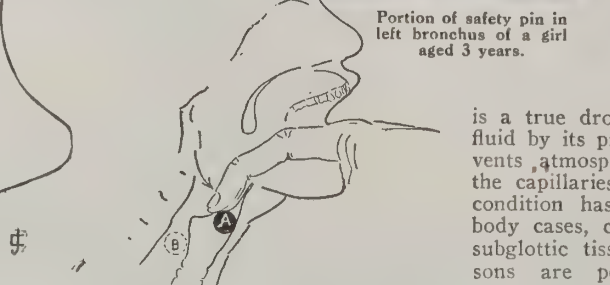


Fig. 10.—Schematic representation of the manner in which a foreign body (A) is frequently forced forward into the larynx by the finger in efforts at removal from the pharynx. If unmolested the foreign body would naturally go down into the esophagus (B).

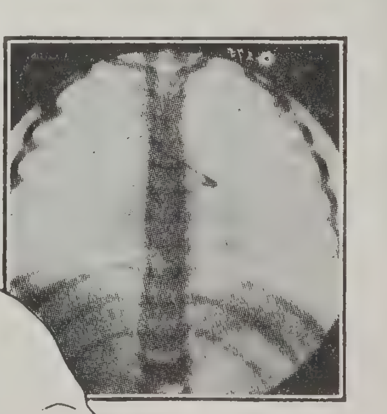
Hardly a month passes at the hospital without the appearance of some patient to have a coin removed from the air passages. As a rule they are the small coins, nickels, dimes and pennies, but on several occasions patients have inhaled half dollars. Atomizer tips also are frequently inhaled. Dr. Jackson notes that "some most astonishing examples of extremely large bodies have been removed" in the clinic. "In one case," he continued, "we removed meat measuring about 2.5 by 4.2 cubic centimetres, when compressed after removal, from the esophagus below the cricopharyngeal constriction. In another case a man almost dead of asphyxia was resuscitated after the removal from his pharynx of a tightly impacted mass of meat that measured roughly 4.5 centimeters in greatest diameter."

What Bronchoscopy Has Taught

BRONCHOSCOPY has taught physicians many things that they did not know before about the lungs, as, for instance, that the deeper air passages are less irritated than the upper ones by foreign bodies. "When each one of us recalls the violent choking and strangling excited in ourselves by a mere crumb of bread that has 'gone the wrong way,'" says Dr. Jackson, "we really refer only to laryngeal sensations. Strange as it may seem, the deeper air passages are quite tolerant for foreign bodies. In most instances after the coughing and choking excited by the presence of the foreign body while passing through the larynx, practically all cough ceases. It is this deceptive and little-known period of quiescence that deludes patient and practitioner into believing the foreign body could not have entered the lung. In one case the family physician when called immediately after the accident said, 'Impossible. You would have been dead in five minutes and would have been coughing your head off the whole time.'

"Of the 23 cases in which the foreign body had been in the lung for periods ranging from three months to 18 years, the clinical signs of pulmonary sepsis supervened and the patients developed the clinical picture of pulmonary tuberculosis, yet in not one of the 23 were tubercle bacilli found, though repeated examinations were made. Moreover, the relatively prompt and complete recovery of the patient in 16 out of the 23 cases clinically substantiated the bacteriological findings. It seems, therefore, that the statement that appears in many textbooks that cases of foreign body in the lung are prone to die of pulmonary tuberculosis is a relic of the days when the diagnosis of tuberculosis was made upon clinical, and not upon the bacteriological, or even pathological data."



Portion of safety pin in left bronchus of a girl aged 3 years.

Another thing that has been brought to light in the work is that it is possible literally for a patient to drown in his own secretions through the work of a foreign body in the lung. "Glottic impairment," says Dr. Jackson, "can cause the bronchi and trachea to fill up until the patient will actually drown in his own secretions. It is a true drowning in the sense that fluid by its presence mechanically prevents atmospheric air from reaching the capillaries of the air cells. This condition has arisen in our foreign body cases, chiefly in children whose subglottic tissues for anatomical reasons are peculiarly susceptible to edema."

Until relatively recent years virtually all the bronchoscopic operations were performed at the Philadelphia institution. Instances are on record of patients being rushed across the country in special trains following the discovery by X-ray of some foreign body in the lungs. Patients still come from long distances, but only in the most difficult cases where the object is so deeply imbedded that only an expert can remove it. The fact that the death rate from the operation has not increased appreciably, although the percentage of difficult cases of long lodgment has gone up tremendously, furnishes a commentary on the skill of the man chiefly responsbile for bronchoscopy and through it for the saving of many lives.

Discovers Cure for Dread Hookworm of South

Young Scientist, Who Has Hobby in Limericks, Does Much for Humanity

By J. H. WALTON

This is one of several articles dealing with important United States officials who are unknown to the general public.

WE MORE often than not picture a scientist as an austere, aged, eccentric individual. We hear and read so much about their peculiarities; how they live a secluded life; advance such "crazy" theories, and so on. The public has come to look for the exceptional from scientists, and the newspapers and magazines see that we are well supplied with "stories" of scientific accomplishments, even though they must add some so-called "coloring" to make them interesting and readable.

When I called upon Dr. Maurice C. Hall I found:

A young man, smiling—with eyes as much as with mouth—who arose to extend his hand and say, "I'm glad to see you, old man, but I'm afraid you have come to the wrong party to get a story. My work is of a very technical nature and isn't likely to be of much interest to your readers."

That "old man" made me feel at ease at once, and the fact that he was young, as well as human, relieved me considerably. I told him I thought people would be more interested to know about his work than he imagined.

Dr. Hall has been with the Bureau of Animal Industry since 1907, having been promoted through the grades of junior zoologist, assistant zoologist and senior zoologist, his present position. During this time he has made many noteworthy discoveries in medical science, the latest and most important of which I will give in detail.

In 1918 he entered the army and was placed in command of Veterinary Base Hospital No. 3 at Camp Lee, Virginia. When he was discharged he returned to the government service.

When I called to see Dr. Hall it was during the luncheon period and he was working on his hobby. Be prepared for a surprise! He was writing limericks. Imagine a great scientist, a man who has made a life study of disease, both animal and human; a man who has seen the most intense suffering, writing limericks! Every year he writes appropriate verses about individual members of a certain medical society to which he belongs. These verses are printed on the program of their annual dinner and are read aloud by the toastmaster. Here are a few samples of the Hall limerick output:

To Dr. Charles A. Pfender, expert in X-rays, Bureau of Animal Industry.

There once was a doctor named Pfender
Saw a person of feminine gender
Cut in two by a truck.
Said he, "Isn't this luck!
Here's a chance to get busy and mend 'er!"

To Dr. John Scott, Parasitologist, University of Wyoming.

There once was a Scott from Wyoming,
Who hunted for bugs in the gloaming.
It made him enraged
When he found them all caged,
Which prevented the insects from roaming.

To Dr. Nathan A. Cobb, Agricultural Technologist, United States Bureau of Plant Industry.

A doctor named Nathan A. Cobb
Drank a health with a thirsty old gob;
He mixed nematoda
With whisky and soda,
And the mixture played hob with the gob.

The luncheon period now being over we will consider Dr. Hall's serious work. His latest presentation to humanity in general, and the medical profession in particular, is a new and efficient cure for the terrible hookworm disease.

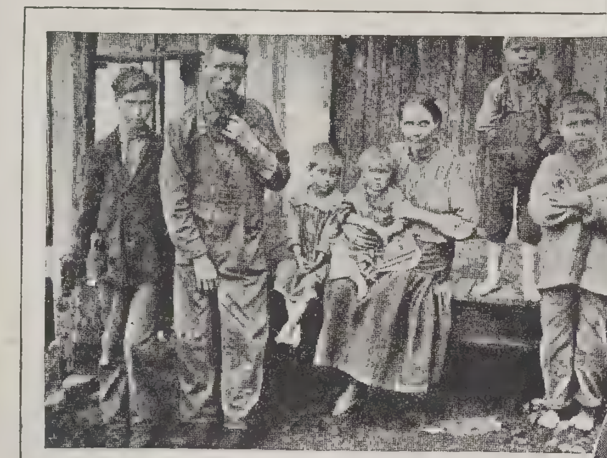
When it was discovered a few years ago that there was a new hookworm preying upon the vitality of the poorer class of people in the South, the press in other sections of the country availed itself of the opportunity to jibe the southern people and called it the "lazy germ" or "slow bug" because it was claimed that this worm weakened the individual and lessened his capacity for work.

Hookworm disease is confined almost exclusively to the southern states. It is caused by small round worms about one-half an inch long, and scarcely thicker than a small-sized hairpin. They live in the small intestine and attach themselves to the intestinal wall, suck the blood, eat the epithelium (cells that line the organ), and produce a poisonous substance which is very injurious to the infected individual.

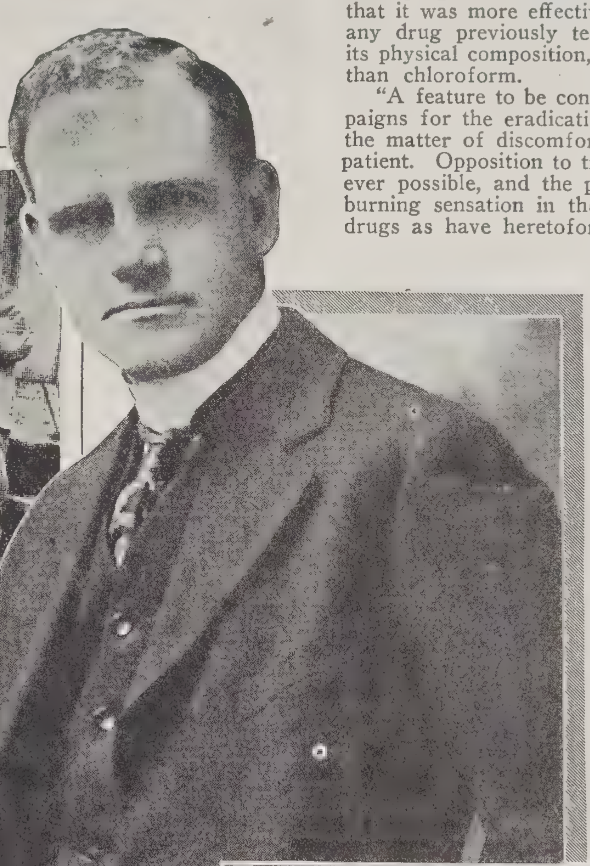
The young hookworm larvae may gain entrance to the body through the skin or by being swallowed. There is a peculiar malady in the South known locally as "ground itch," "foot itch," "toe itch," "dew itch," "dew poison," and so on, which comes from going without shoes and stockings. It is now definitely known that this itching is caused by the larvae of the hookworm in the skin of the feet. The poorer class of farm people, both black and white, go barefoot most of the time. The larvae of the hookworm enter the feet and gradually work into the blood, and thence to the intestines.

Dr. Charles W. Styles, noted authority on hookworm disease, says, "In my experience about 87 per cent of hookworm cases definitely admit a history of ground itch.

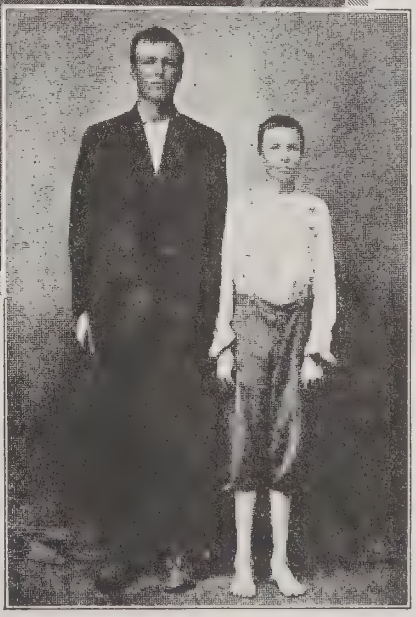
"It is especially in the rural districts, or among persons who have recently come from rural districts, that hookworm disease is found," continues Dr. Styles. "This is due to ignorance and carelessness exercised in the rural areas in respect to sanitary conditions. In a region where more than 50 per cent of the farmhouses and at least 30 per cent of the country schools, and even a much higher percentage of the country churches, have no toilet closet whatever, hookworm disease has an excellent chance to spread, and in our rural South it is one of the most common of the diseases. My estimate is that not less than 30 per cent of the rural inhabitants of our southern states have hookworm infection. In some restricted localities fully 90 per cent have the infection."



Photos courtesy of U. S. Dept. of Agriculture.
A typical southern rural family. Note the "fish stare" of the eyes. This entire family is infected with the hookworm disease.



MAURICE C. HALL, Ph.D., D.V.M.
Senior Zoologist, United States Bureau of Animal Industry.



Showing dwarfing effect of hookworm disease. These boys are brothers. Jones County, Miss. No. 1, age 17, weight 156 pounds; light infection. No. 2, age 18, weight 74 pounds; heavy infection.

The disease is much more harmful than is generally supposed. If a child is infected, and thousands are so infected every year, both his physical and mental development is retarded, and the child shows a more or less extreme anemia, commonly called laziness. A person 21 years of age may appear not better developed than one of 14, and in extreme cases the disease has been known completely to retard mental growth, making imbeciles out of its victims.

There are drugs used as a cure for hookworm disease but they are all dangerous, the after effects sometimes proving fatal to the patient as well as to the worms. Dr. Hall, speaking of his newly discovered cure, says, "The ideal drug would be one which was 100 per cent effective, removing all the worms present, and at the same time entirely safe and free from other objections. Such a drug is difficult to find. Practically all the anthelmintics are more or less poisonous, being intended to poison the worms and at the same time not cause any appreciable amount of poisoning or injury to the patient. Moreover, there are so many factors in the way of anatomical structures, food habits, individual idiosyncrasies, and other things which complicate the action of anthelmintics that it appears impossible to find drugs which will always remove all worms in all cases.

"If a drug is approximately 100 per cent effective and reasonably safe it is a very satisfactory drug. In actual practice the aim must be to determine which is the best thing we can use, rather than to find the ideal. In some cases drugs which have long been in use have been found quite ineffective.

"Carbon tetrachloride had been used to a slight extent as an anesthetic in human medicine more than 50 years ago, but it had not been found satisfactory and had not been in use as a drug for more than half a century. It has been sold in various forms as a cleanser for clothing, Carbona being one of the most well-known.

"I conducted tests of this substance on dogs, as experiments indicated that the efficacy of anthelmintics against hookworms in dogs was much the same as their efficacy against hookworms in man. These tests showed that it was more effective in removing the worms than any drug previously tested, and, apparently owing to its physical composition, it was found to be much safer than chloroform.

"A feature to be considered in connection with campaigns for the eradication of hookworms from man is the matter of discomfort and subjective effects on the patient. Opposition to treatment must be avoided whenever possible, and the production of headache, nausea, burning sensation in the stomach, and so on, by such drugs as have heretofore been used, frequently makes it difficult to give a second treatment or to bring in new patients after the word has passed around that a first group has been made ill by the treatment.

"To obtain first-hand information on this point in regard to carbon tetrachloride, I tested the drug on myself before presenting my paper to the medical profession for their consideration. I found that there were practically no evil effects as I was able to continue with my regular work as usual during the day, after I had taken a large dose of the drug in the morning.

"As far as may be judged from the experiments, this drug is more effective against hookworms than any of those commonly used. It appears to be very safe, there being no bad effects after taking, even in doses five times as large as are necessary to give dependable efficacy against hookworms.

"In view of the excellent results obtained with this drug in removing hookworms from animals, I brought it to the attention of the medical profession in an article in the *Journal of the American Medical Association.* Tests of the drug for the removal of the hookworm in humans were undertaken at various places in the world, and reports have largely been published in regard to the results obtained by some of the physicians in the service of the Rockefeller Foundation. In Fiji and Ceylon, data indicate that the drug has been used with excellent results. More work remains to be done before it can be said that the drug is established as firmly in human medicine as it is in veterinary medicine for the removal of hookworms, but the satisfactory results obtained up to the present time give reason to hope that this drug will furnish a means whereby hookworm disease may be controlled more effectively and with greater safety to the patient than has been the case with the drugs previously employed. It is hardly to be supposed that the use of carbon tetrachloride will be found entirely free from objection, but it has been proved to be more free from objection than other drugs, and its use constitutes a distinct advance in this field of medicine."

This important advance adds another discovery to the list of those that government scientists, working for you and me, have contributed to human medicine. If it comes up to expectations, and all tests so far have been highly encouraging, this drug will be a boon to millions of persons in many parts of the world, and may in time wipe out the dreaded disease in our southern states.

How Our Fathers Met a Money Emergency

Page From History Shows How Boston Bankers Beat Game by Service

By WILBER L. STONEX

COMMERCE consists of the exchange of commodities; and the commercial prosperity of any country depends upon the facility with which its commodities can be exchanged. It necessarily follows that the instruments by which exchanges can be made should be obtainable at the lowest possible cost. The primitive and least convenient method of carrying on business consists in the exchange of one commodity for another. A more convenient method is for a community to agree that some article of little utility shall be accepted by all of its members at an agreed value when offered in exchange for any other commodity, or for the payment of a debt. And theoretically the less the intrinsic value of the instrument the greater its value in facilitating exchanges.

The medium which most perfectly complies with these requirements is the bank check now in common use. This instrument of exchange is of comparatively recent date but its convenience is such that it has grown to such a volume in this country that it is safe to say the most of our domestic commerce is carried on with it. And yet it has grown up outside of the law, and its simplicity is such that no other law is required to perfect it than to make it a criminal offense for any person to draw a check on any bank with which he has not a credit sufficient for its protection. And such laws are now quite common.

No Mystery About "Money Truth"

IN TREATISES on money, bank checks are quite generally included as a form of money. And yet it is a medium which is not only of practically no intrinsic value but is not based upon a security of intrinsic value nor upon any specific representative of intrinsic value. In this respect it differs wholly from coin and from paper currency specifically secured by coin or bullion.

It is apparent that the principles to be applied in discussing these two radically different mediums of exchange cannot be the same. And the failure of those who have written on the subject to recognize this fact has led to the confusion which exists in practically all treatises on the subject. The extent of this confusion is accurately stated by Professor Laughlin in his treatise, Principles of Money. He says:

"As now massed, principles and applications in most popular treatises are so combined that a refutation of one point allows the routed opponent to find cover behind some shelter which to the casual observer seems connected with the old position when it has in truth no such relation: and a warfare of this kind can go on forever without issuing in definite conclusions."

And to the same effect a well-known writer on economics has said:

"Even those natural laws like gravitation, which are clear in themselves, if they be such that the choices of men have to do with, such as may be modified and in a sense controlled by human actions, become from that very circumstance liable to difficulty and even to some mystery. All truths of Money belong to this class."

While it is to the interest of those who profit by controlling the money of the people to have the "truths of money" involved in mystery, there is, in fact, no mystery whatever about them.

One who would understand the simplicity of the principles upon which credit currency of the bank check kind rests will do well to turn away from the theorizing of the popular treatises and learn the truths by studying the experiences of practical men. He will find that a credit currency meets all of the requirements of the most exacting economic laws and has been fully tested and found to be absolutely sound. He will also learn why the system is not now in general use, and by how simple an act of legislation it can be put in operation to the immense benefit of the people.

When Circulation Was $4 Per Capita

IN THE period following the end of the Revolutionary War economic conditions were discouraging almost to the last degree. This was largely because of the lack of money. The paper currency issued to support the war had become of no value partly because of the overissues and also, perhaps chiefly, because these issues had been counterfeited by the British and the country flooded with them. Of gold and silver there was none in the hands of the people. The most accurate estimates we have are that in 1784 the per capita circulation was about $4. There was no gold or silver upon which to base a paper currency and the problem was how to issue a paper currency based upon credit. Of the various solutions attempted the most simple and satisfactory was that of Massachusetts. It consisted of bank notes which in all material respects were identical with the bank checks now in common use.

As Boston was the commercial center of the state these bank notes sooner or later found their way into that city. A clearing house system was in operation for the convenience of its banks and it was thought best to have all notes of out-of-town banks cleared at one of the city banks. The Suffolk Bank was selected for that service and the system became known as the Suffolk Banking System. This bank became to that extent a bankers' bank. The banks which came into the system were required to keep accounts with the Suffolk Bank and maintain sufficient credit to protect their notes (checks) precisely as patrons of banks now do; and the basis of the credit thus obtained with the Suffolk Bank consisted of the deposit with it of the notes of banks of good credit, and other securities satisfactory to the Suffolk Bank.

As originally enacted the banking law of Massachusetts did not require the banks organized under it to redeem their notes in specie; they were not required to have a specific amount of capital; and no limit was placed on the amount of notes any bank might issue. Later a definite amount of capital was required, but no relation was fixed between the amount of capital of any bank and the amount of notes it was authorized to issue. But in 1813, apparently for the protection of stockholders, who were personally liable for the payment of all notes issued by their bank, it was enacted that the note issues outstanding at any time should not exceed twice the amount of the bank's capital. At the same time, a law was enacted requiring every bank to redeem its note issues; but the requirement as to redemption was indefinite. It was probably intended by the enactment of this law to compel all banks not already in the system to enter it. In the public interest the Suffolk Bank cleared the notes of banks which kept no deposits with it, but such notes were subject to presentation and demand for payment at any time, and when thus presented their payment was demanded in specie. By the writers on banking who condemn this system this feature is roundly condemned as "coercion."

Although Mr. Hepburn in his "Contest for Sound Money" condemns the Suffolk System he says of it:

"The people were not subjected to the onerous discounts which country banks otherwise suffered in the money centers. This loss had been from three to five per cent. The New England Bank of Boston had reduced it to less than one per cent, the actual cost of sending notes for redemption, but the Suffolk reduced it even more, so that ultimately the cost was only 10 cents per $1,000 and this was borne by the banks."

In 1858 the Suffolk Bank made over its special business of note redemption to the Bank of Mutual Redemption of Boston, which was organized for that purpose by the country banks. In 1860 there were 504 New England banks in the system.

A Little Chapter From U. S. Officials

WHILE there was apparently a limit placed on the amount of the note issues of these banks there was in fact no limitation, for the actual note circulation never approached the legal limit. In 1840 the actual note circulation was only 23 per cent of the amount permitted; in 1850 it was only 40 per cent; and in 1860, 36 per cent. And during every year from 1840 to 1860, except one, the note issues were greater than (and usually nearly double) the amount of the deposits.

Of the note issues of this system, the report of the Committee on Banking and Currency of the House of Representatives, made by Mr. Fowler, its chairman, said:

"When the soundness of this system is tested by comparison with the national system of today the result more than justifies the assertion that the former was incomparably the better; for when the conditions during the 20 years from 1840 to 1860 are compared with those of the past 30 years, all must admit that argument is futile and the conclusion inevitable. . . . While a tax of one-eighth of one per cent on all the bank notes in circulation would have paid all the notes of failed banks from 1840 to 1860, it would have taken a tax of one-fifth of one per cent on all notes out to pay the notes of the failed national banks."

The effect of this system on interest rates is shown in the report of the bank commissioner of Connecticut for 1844. He said:

"It has been impossible for the banks of discount to find use for all their money in discounting good paper, and some, having the largest capital, have reduced the rate of interest, in a few instances, to five, four and even three per cent."

Another interesting fact concerning this system is shown in the statement of the condition of the banks of New Hampshire which were members of the Suffolk System, on the first day of June, 1860. At that time, although the deposits with these banks were only $1,211,551.88, the notes issued by the banks and then in circulation amounted to $3,117,444, and the amount of specie then held by these banks was only $253,496.35, or only five and four-fifths per cent of the notes outstanding and deposits combined; the notes of the banks in the Suffolk System were then selling at a premium in all parts of the United States.

How a Good System Was Destroyed

THE fact that the credit currency note issues of the banks in the Suffolk System were not subject to discount did not meet the approval of the bankers of New York City and they were intensely hostile to it; the "bond secured" system was more to their liking. In 1854 the New York *Courier and Enquirer* in discussing the deplorable condition of the state bank currency of that state, said:

"The anomalous feature of the case is that the well-secured bond-protected bank issues of New York are at a greater discount at this point than the apparently unsecured circulation of New England, including places hundreds of miles off, inaccessible, in a measure, for compulsory redemption . . . . We said that the Massachusetts currency was apparently unsecured. In reality their bank paper is well secured. The experience of the last 15 years has demonstrated that the losses from bank issues in the state of New York are four or five times greater than in Massachusetts. The system of the latter is better than our own."

The Suffolk System was so entirely satisfactory to both the bankers and people of New England that there was no disposition on their part to abandon it, and it was not until 1865 that the influence of the hostile banking interests were able to destroy it. This was gradually and indirectly brought about by a succession of acts of Congress. In 1863 Congress first imposed a tax, as a revenue measure, of two per cent on all state bank notes in circulation and 10 per cent on their fractional note issues. This not proving effective the revenue act of March 3, 1865, imposed a tax of 10 per cent on all state bank notes. The purpose of this enactment was not to produce revenue but for protection only—the protection of the banking interests of New York City against the competition of the country banks of New England. This act produced the result desired by forcing the competitors out of business. This act is still in force and in my opinion all that is necessary to restore the system of banking destroyed by it is the repeal of this feature of the act of 1865.

Trying a Case in the Newspapers

Concluded from page 7

that his client is undecided whether it was a bullet from his gun or the major's that killed his superior officer.

So evidence accumulates that Pothier really did have a loaded weapon at the time of the major's death, and was firing it. Could Rosenbluth, standing close beside the major during the firing of the second and third shots, have been unaware of this? Then why did he fail to mention this all-important fact at the Military Board of Inquiry, when he was under oath?

In my investigation of this case, I have yet to meet a single person with a disposition to be anything but fair and just to Robert Rosenbluth. But I fear that he is being ill-advised. Why does he object to going to Tacoma, pleading to the indictment, and telling his story? No innocent man need ever fear the temper of a Federal court. Justice, stern and inflexible, blindfolded and balancing the scales, *demands the truth, in spite of racial clamor and attacks upon public prosecutors.*

The publicity campaign in behalf of Rosenbluth was worked to the limit in spreading broadcast the *World's* alleged retraction of Pothier's confession. I have before me a volume of 62 closely printed pages, bound in a yellow paper cover, and bearing conspicuously the following title:

EXONERATION
of
CAPTAIN ROBERT ROSENBLUTH

This booklet purports to be "The Official Report of Honorable J. W. Selden, prosecuting attorney, Pierce County, Washington, in the Matter of the Death of Major Cronkhite." It bears no mark of origin, nor the name of its publisher, but it is quite evidently the output of a printing establishment on the East Side of New York, the work of men ill-acquainted with the proper usage of the English language. Words such as "Department of Justice," "Federal," and the like, are headed with small letters. This volume has been circulated industriously from Boston to Washington, D. C., from New York City to Tacoma. It has been sent to newspapers throughout the country, to public officials and to organizations. It costs a considerable sum of money to print a volume of this kind, and give it a wide circulation through the mails.

The title of this booklet is entirely misleading, since Mr. Selden has never been called upon to try the Rosenbluth-Cronkhite case, has not seen the evidence, nor has he heard the testimony of witnesses. The information in the possession of the Department of Justice has never been turned over to the prosecuting attorney for Pierce County, Washington. I do not know who has approached Mr. Selden in this matter, nor whether his authority was obtained in giving a statement out in this form.

The volume consists almost entirely of attempts to discredit Pothier's confession, and affidavits evidently gathered by Goldstein & Goldstein, among them being statements from Goldstein & Goldstein themselves, from the attorney for Pothier, from the New York *World* reporter, and the like. It contains a slur cast upon the parents of the late Major Cronkhite, but it does not contain a word of explanation from Rosenbluth.

A man is charged with murder. He refuses to answer to the charge, but fights his extradition. A newspaper friendly to this man publishes an alleged retraction by his accuser. His lawyers issue a booklet announcing his exoneration. Presto! the man is acquitted without having been tried. There has been no need for law courts, judges, juries, prosecutors, witnesses. "The case has been tried in the newspapers." This is a new form of criminal procedure that is being introduced into this country by a certain racial element.

During a great deal of uproar and clamor, the Department of Justice apparently abandoned the case. Then loud and insistent demands were made upon the Attorney-General that the department must announce its exoneration of Rosenbluth.

The reply to this demand was evidently unexpected. It came in the form of an indictment for murder, returned by a Federal Grand Jury in Tacoma, Washington, October 13, 1922, *after it had listened to the testimony of more than 70 witnesses who had been summoned from widely distant sections of the country.*

(The next development of the Rosenbluth-Cronkhite case was as characteristic as the preceding ones. It will be told in a fourth chapter of this illuminating story upon the activities of "our people.")

The Background of the Story of Evangeline

Concluded from page 8

Well, for one thing they were required, if they wished to become British subjects, to take an oath of allegiance to the British crown. This they were quite willing to do; but they desired to make a reservation with respect to taking up arms against their former fellow-countrymen; also they were not quite sure how free they should be in the exercise of their religion. Therefore, they were determined to depart. But they were refused permission by Colonel Vetch, lieutenant-governor during Governor Nicholson's absence, upon the pretext that he did not have sufficient authority. The real reason was that the Acadians were the only inhabitants in the country; if they were to leave, the land would be stripped bare of people. Besides this, the British garrison was dependent upon them for food, fuel and labor. There was the additional reason that, by emigrating to Ile Royale, the Acadians would strengthen a potential enemy.

From then on, until, 40 years later, they were shipped like cattle to strange lands among strange people, the contest was continued between the Acadians and the governors, one after another. The latter were determined that the Acadians should take an unconditional oath; and the people were as determined not to do so. They preferred to leave their homes and emigrate; but the governors, when they proposed to leave, would not allow them to depart. Having been refused British ships in which to transport themselves and their effects, and French boats being forbidden to enter the harbors, the inhabitants built small vessels themselves but were prevented from securing the necessary rigging at Louisburg or at Boston; and finally their boats were seized. Departure by water being impossible, the Acadians decided to transport their effects by land to the eastern end of the peninsula from whence they might cross to Ile Royale without much difficulty. To do this it was necessary to cut roads, but they had hardly commenced this work when they were peremptorily forbidden to continue their road-making.

The governors were men of varying temperaments: each tried to threaten, cajole or force the people into taking the oath without reservations; but to each the Acadians returned the same answer. Finally, Governor Philipps in 1729 succeeded in inducing them to take the oath after he had made verbal promises covering the points upon which they required reservations. He felt this course to be less derogatory to the dignity of the crown than written conditions. Cornwallis, uncle of Lord Cornwallis of Yorktown memory, who came out to the colony as governor in 1749, revived the question of the oath, requiring all to swear unconditional allegiance within three months or leave the country. But the Acadians were as determined as ever. In the end, Cornwallis allowed the matter to drift as had his predecessors.

Although England and France were nominally at peace, Governor Shirley decided, in the spring of 1755, that the time had come to drive the French from the peninsula. He accordingly dispatched Colonel Monckton with a force of 2,000 men to assist Major Lawrence, then at the head of affairs in Nova Scotia, in carrying this design into effect. Fort Beausejour was first proceeded against and capitulated after a short siege. Among the garrison Monckton found 300 Acadians, but pardoned them because they had been forced to serve upon pain of death. Despite the fact that the Seven Years' War which was to see the end of French hopes in North America did not actually commence until the following year, the fall of Beausejour was a presage of what was to come. But before that should come to pass the final scene in the present drama was to be enacted.

Charles Lawrence had been, first, administrator, and later, governor, of Nova Scotia since the autumn of 1753. That he was a man of more than average ability is evident from the fact of his having risen from the position of an unknown house-painter's apprentice to the governorship of Nova Scotia in a time when plebeian origin was a decided handicap. There is no doubt that he was a capable soldier, but his character was such that he should never have been placed in a situation where the destinies of a people were in his hands. He was haughty, disdainful and unscrupulous. Not only was he feared and hated by the Acadians, but he quarreled with the English population as well, referring to his council as a pack of scoundrels and to the merchants of Halifax as a parcel of villains and bankrupts.

It would be expecting too much to hope that such a man would be fair to the Acadians, who were entirely under his control and could appeal from him to no one. They had by now increased to something more than 10,000; their flocks and herds had increased in like proportion; and their lands were the richest and most fertile in the province. But they had practically no status under the law. Since 1730 they had been known as "French Neutrals." Not having taken the oath of allegiance, they were not considered as British subjects, and consequently their disputes were not tried in the courts, but were settled among themselves as had been their custom in the days of the French régime. They undoubtedly presented a problem to governors accustomed to divide mankind into two classes: friends and enemies. In the wars between the French and English, particularly in America where Indians were employed, atrocities were committed on both sides that filled each with bitterness toward the other, and it is possible to understand how it was that human feelings of compassion were frequently absent in their dealings one with the other.

Lawrence undoubtedly was a man who believed in a literal obedience to orders; and the instructions received from the Lords of Trade in England, on more than one occasion, were implicit: that the Acadians should take the oath or leave the country. But for 40 years these instructions had been evaded, and without doubt evaded with the full concurrence of the Lords of Trade. The official dispatches go to show that the latter were most apprehensive lest Lawrence's proposed intention to bring the matter to an issue should cause the Acadians eventually to leave. But Lawrence had already determined upon expulsion, not emigration to the French settlements along the St. Lawrence, which the inhabitants had considered as a possible contingency for the past 40 years, but dispersion among strange people in a strange land.

The crops were ripening in the summer sunshine in the year 1755 when Colonel Winslow, member of a prominent New England family, marched into the village of Grand Pré, in the district of Minas, at the head of 365 men, and established his headquarters in the church, pastorless since the arrest of the curé at Lawrence's orders some weeks before. The British flag was hoisted upon the steeple, much to the horror of the inhabitants gathered in apprehensive groups discussing the probable meaning of this untoward event. Little did they realize what was in store for them.

On August 30 a number of vessels dropped anchor in the Basin, and, everything being in readiness, Winslow issued a proclamation ordering all males more than 10 years of age to gather on September 5 in the church at Grand Pré to hear the king's final resolution regarding their fate. Upon the appointed day the roads leading to the village were crowded with the conveyances of the sturdy Acadian peasants on their way to obey the summons. At the appointed hour 418 men and boys were gathered in the edifice inseparably associated with their most cherished memories. The silence was tense, as Winslow, in full uniform, surrounded by his officers, advanced to a small table in the open space in front of the rail, and, in a short speech, in which he expressed his distaste for the duty assigned to him, informed the expectant assemblage that it was the king's pleasure that their lands and effects should be forfeited, and that they should be removed from the province. In the meantime they would remain as prisoners in the church. The consternation of the Acadians can be imagined.

During the succeeding days Winslow's officers visited all the near-by villages, arresting the men and bringing them to Grand Pré to swell the numbers of those already under guard. At length, fearing mutiny among the prisoners who outnumbered his men, Winslow decided to place the unmarried Acadians aboard the ships that lay in the Basin. They were formed up in front of the church between lines of soldiers with fixed bayonets. When word was given to march they were reluctant to move, but the menacing bayonets urged them on down the mile-and-a-half of road lined with mothers, sisters, sweethearts, to the landing place. As they passed, a cry arose from the lines of weeping and praying women and children which must have wrung the hearts of even the rude soldiers whose duty it was to cause such misery. Next, about 100 married men were embarked; but as further transports did not arrive until over a month later, the ships were held in the Basin until all should be ready to depart, the prisoners being fed with provisions brought to the shore by the women.

At last the day came for the final embarkation when, as Longfellow says:

> ". . . . mothers saw their children
> Left on land, extending their arms, with wildest
> entreaties."

But after the vessels were filled to capacity, Winslow found he still had 600 prisoners to be disposed of. Further transports did not arrive until December 13 and it was not until a week later that the final transports sailed away

> "Bearing a nation, with all its household gods,
> into exile,
> Exile without an end, and without an example
> in story."

As they passed down the Bay the exiles could see the smoke and flames of their burning homes, fired by order of the commander.

Somewhat similar scenes were enacted at Chignecto, at Pisiquid and at Annapolis Royal. In all, about 6,000 people were deported; 1,000 were driven into the woods; and about 3,000 made their escape to the French settlements farther north or on what is now Prince Edward Island. The exiles were dispersed among the British colonies of Massachusetts, New York, Pennsylvania, Maryland and the Carolinas. Some succeeded in reaching the French colony of Louisiana.

The Treaty of Paris in 1763, which put an end to the war that had raged since shortly after the expulsion, made it possible for the homeless wanderers to turn their steps once more in the direction of their beloved Acadia. In 1766, those living in Massachusetts gathered at Boston and from there commenced the long journey through the wilderness. Many died by the way; but after four months the survivors, footsore and weary, came again into the land of their youth only to find that in their place dwelt

> ". . . . another race, with other customs and
> language."

The blame for this great wrong rests with but one man—Charles Lawrence. His action had the support of his council and of other executive officers, but there can be little doubt that the project was his alone. Whatever may have been Lawrence's motive, it is quite clear that the home government was entirely innocent of any knowledge of, or concurrence in, the expulsion; and it is quite probable that the outbreak of the Seven Years' War so soon after, and his early death, saved Lawrence from the consequences of his action—but not from the verdict of history!

Crossing the Rockies in the Locomotive Cab

Concluded from page 6

miles to Field—I wondered as to the best method of using my surplus leg for the time being.

Keeping a foot suspended, especially over a yawning abyss beneath it, made me realize that being either a hero or villain, as the case may be (and many such have occupied a similar perch at some time in their romantic careers), had its drawbacks. My life then hung upon the hand-bar—and I admit now that I placed great faith in iron, used externally. If the iron bar had failed— But I was always concerned with my free leg—not the same leg all the time, since I alternated —and *terra firma* looked unusually good to me, especially with so much of it abounding about me, and most of it dependable, since it was patented some time prior to the paleolithic age. Tantalus reversed—earth instead of water. But the builder of the engine must have foreseen my predicament, even though he did not think about it, for there was a four-by-five roweled footrest. Of course, there was no possibility of there existing a Cinderella-footed engineer, so this step was inadequate for the average No. 9 shoe, but analysis led me out of my troubled inquisitiveness. It was small, not so much to fit only the forepart of any engineer's shod foot, but to prevent any man from wanting to take a chance to hang on behind, as it were. The designer had provided very well, apparently, to swerve me from my purpose, even though the officials in due time relented for the reader's behalf.

I had no choice. I merely rested as much of my foot on this iron step, but now the surprise was in store for me. I was become an automaton, for one step, be it remembered, was attached and fixed to the tender, and the other was duly ornamenting the locomotive. The two are twain—sometimes. There is a coupling underneath the laminated areaway. The tender would descend as the locomotive would rise, and obviously my nether extremities accompanied this irresistible force, even though I was not disposed so to do.

However, there was one advantage. I was outside the cab, behind the engineer, something like half a yard below his level, and anatomically projecting into the outer space in defiance of all. I saw what the engineer saw and what he did not see. I peered down and under—and there were the tireless drivers and their regular metallic resonance born of their thrusts, and there is something unusually hypnotizing about this marvelous movement. Coming upon each curve, one feels forward the momentum that is lost in the rear—and yet despite the eye's illusion that no train could successfully negotiate the curve ahead and remain on the track, there we are—riding over them as steel flange caresses steel head. Unless the curve is unusually sharp its existence is almost unnoticeable.

Certainly I should have felt it, for my position was sensitizing, and the vibration of the monster permeated through me. That man's ingenuity has resulted in the exceptional was proved right and here and now, for it was many miles ere I was aware that my hands had become numbed as they firmly grasped the hand-bar. A mere desire to tie my shoe laces might have—no would have—bounced me—

Yes, into the Kicking Horse River. It is a nice river, but one that must be met gently, not catapulting from an engine. Exhilaration set in and except for a cinder about the size of a mountain, which left me only one eye to see by, there was nothing that I could desire, except an arm chair, two or three cushions, and so forth.

Well, to make a now 40-mile story a 20-mile one, I made the automaton understand that if I was a poor one at railroading I was a fair one at pencil-pushing. Magic of magic! The sun beaming upon the earth after the deluge never brightened things as that smile of Brother F. England. It saved an extra shovelful of coal, things warmed up so quickly. And by now it was a better appreciated smile, because he had shoveled something like three tons of bituminous coal (and a poor grade of it, which meant more coal) into the firebox, shaken two of six grates, washed that hot floor twice, crushed lumpy fuel with a small sledge, watched the water gauge, taken on water, filled his pipe twice, nibbled at a quick lunch, and a few other things. But despite all this, and doing it all over again, more or less, he managed to show me the points of interest, from Mt. Hector to the Great Divide and farther.

There must have been some high sign exchanged between Brother England and Engineer Monilaws—J. G.—because the latter, too, at once had something to say. I could hardly keep up with their communicativeness. I did my best, trying to balance myself on the swaying platform, left-facing when the fireman addressed me and right-facing when the boss spoke. "Right," "left," "right," "left"—

We reached Lake Louise. We had risen 510 feet, and were now 5,044 feet above sea level. Here a powerful oil-burner was coupled to our locomotive for the coming rise—a few hundred feet up to Stephen, almost a mile vertically from Montreal, my starting point.

The run between Stephen and Field is essentially simple, but it is delicate. That is, it is simple so far as the train itself goes, because gravity makes motion, but the strain on the engineer is intensified. The sense of hearing governs him, since he can see nothing.

At Field I left two most genial men. As I wended back to my stuffy sleeping car they detached No. 564, as this was the end of their division run. Later that evening they would go back—retrace their route.

U IV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The Nobel Peace prize has been awarded Dr. Fridtjof Nansen, noted Norwegian explorer. He was prominent in Russian relief work during the famine of 1921. Dr. Nansen is professor of oceanography at Christiania University. He has announced that he will devote the money awarded him in fostering his international task of promoting a brotherhood of nations.

Three-quarters of the mineral-bearing area of Alaska has never had a prospector's pick in it.

During 1922, 7,469 miles of road projects were completed in the United States and 17,978 miles under construction were estimated as 50 per cent complete. Federal aid earned by the states on all road projects amounted to $194,560,135, of which $166,911,552 had actually been paid.

Chinamen are engaged in capturing large sea turtles which abound on the western coast of Mexico. The meat of these turtles is dried and shipped to China where it finds a ready sale.

Kentucky has another world wonder in Onyx Cave, near Mammoth Cave. The caverns are close together and it is possible to include both in the same trip. Mammoth Cave has for more than a century attracted tourists from all over the world.

From Cracow, Poland, the Rev. H. H. Benedict writes: "The subject of persecution of Jews in Poland is one that needs to be written about impartially. The Jews know what effect reports of 'pogroms' have in the United States and they often exaggerate little incidents or fabricate entirely such tales as will be sure to draw sympathy for them. As for my own experience, I can assure you that no 'pogrom' or persecution has taken place in the regions where I have lived during my stay of three years."

For the first time in history a woman, Mrs. Annie L. Swynnerton, a painter, has been elected an associate of the Royal Academy of England.

A new cable-way among the clouds is being built up Mont Blanc. Passengers will be transported in 90 minutes from summer heat to frigid cold while snow and ice avalanches crash harmlessly by, hundreds of feet beneath the suspended cable cars. Each car will seat 20 persons.

The undergraduates of Wesleyan University have voted to abstain from drinking rum while the college is in session. First offenders will be ineligible for sports or student office. Second offenders will be expelled or suspended. The action outlined above was not taken as the result of any outbreak of drinking at the college but as a further step in self-government.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Leper patients on the island of Molokai, anticipating release on parole or full discharge as a result of the Chaulmoogra oil treatment, are asking permission to take up land on the island adjacent to the leper colony.

Radio broadcasting is becoming popular in Australia. To operate a receiving set, crystal only, it is necessary to obtain a license costing about $5. Permits for transmitting are rarely issued to individuals and there are only about 12 transmitting stations in the whole country.

Only four wooden railway mail cars are now in use in the United States, the rest being either all steel, or made with an all-steel under-frame or of steel-reinforced wood.

Vincent Astor, of New York City, a direct descendant of John Jacob Astor, who founded Astoria, Oregon, as a fur trading post in 1811, wired the Astoria Relief Commission $5,000 for its fire relief fund. Astoria was the first settlement in the Columbia River Valley and was recently swept by a disastrous fire.

Trichinosis, a disease caused by eating imperfectly cooked pork in which the trichina parasite is lodged, may be prevented if the pork is cooked thoroughly.

Western music is becoming fashionable in Japan and a study of the piano is now considered a necessary part of the education of a native girl. The playing of the "samisen" and the "Koto," the national harp, has not been abandoned, but the younger generation is taking to foreign instruments.

A bill prohibiting girls and women from cutting the hair so that it does not fall below the shoulders is to be introduced to the legislature of Hawaii.

All contributors of $100 or more to the campaign fund of Senator George Wharton Pepper, of Pennsylvania, will receive a refund of 10 per cent as the entire sum of money contributed was not spent.

Refugees were rescued from Sulaimaniyeh in Southern Kurdistan by aircraft. This is the first time in history the evacuation of a town has been carried solely by this means. In spite of a fierce gale a detachment of R. A. F. airplanes collected some 60 men, women and children and transported them to a place of safety.

Two men labor continually in the Pennsylvania Station in New York City to remove wads of chewing gum travelers have tossed on the floor.

The delta of the Mississippi has just been surveyed for the first time with accuracy by using cameras from airplanes.

Due to a shortage of coal, five schools in Reading, Pennsylvania, were closed. Reading is a gateway to the anthracite fields through which millions of tons of coal pass every year.

A synthetic apple oil possessing the aroma of ripe apples has been prepared by the Bureau of Chemistry. The preparation has the merit of having no substance in it that does not occur naturally in the apple. The oil, being volatile, may not be used in the preparation of food products that have to be heated, but is especially suitable for flavoring ice cream and cold drinks.

Becoming enamored with the army posters describing life in the tropics, a young girl, dressed as a boy, tried to enlist in the army at Rochester, New York, recently.

There will be no settlement of land in that portion of Southwestern Colorado and Southeastern Utah on which are a number of prehistoric towers erected by Indians. The towers are among the finest examples of prehistoric masonry in the United States, according to the Smithsonian Institution. The land in question is in three strips about 50 miles west of Mesa Verde National Park.

The Carnegie gold medal has been awarded Professor Bergonie, of Bordeaux University, who lost his right arm and three left fingers while experimenting with X-ray.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

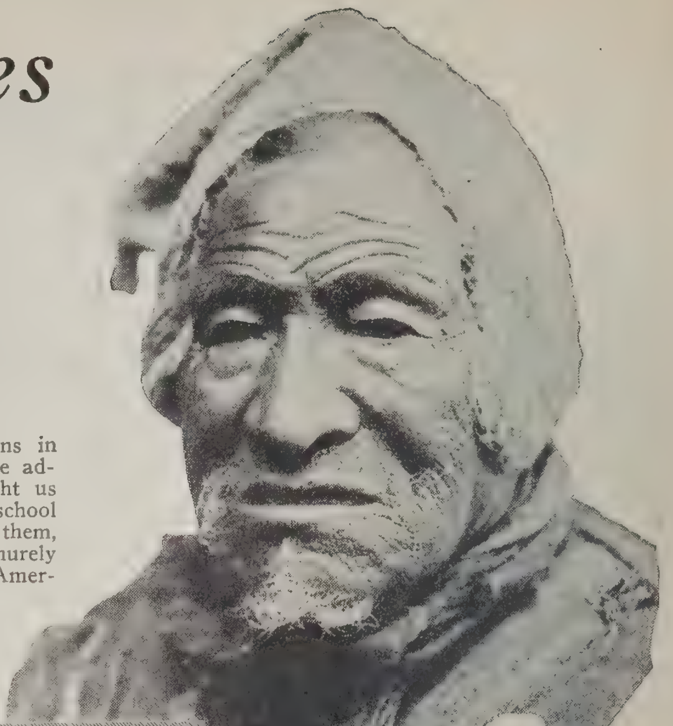
CHRONICLER OF THE NEGLECTED TRUTH

Main Street in the Andes

Cheerless Life of the Native on the Shores of Beautiful Lake Titicaca Is Revealed

By CARROLL K. MICHENER



An aged Bolivian Indian of the Aymara Tribe, La Paz, Bolivia.

BENEATH a eucalyptus tree in Yunguyo we made the acquaintance of the *alcalde*, Manuel Mamañi, leaning proudly upon his silver-ringed staff of authority. With him sat Mateo Chipañi, the *ilacata*, shiny-faced and abashed, but willing to be honored by the taking of a photograph. *Coca*, the leafy narcotic native to the old Inca empire, bulged the cheeks of these political dignitaries. There was an air of intense melancholy about them, yet they wore ponchos and mufflers brilliant with all the natural colors, and were unquestionably the brightest feature in a drab landscape.

About them waned the inconsequential afternoon of a Peruvian village. Hucksters squatted at the margins of the muddy public square, conducting their sparse business in trifles—a handful of shelled corn, a dozen bullet-like frozen potatoes, or a bundle of reed baskets. An occasional beggar, as decayed, blind and calamitous as any in the mendicant Orient, crawled whining for alms over puddles of filth compounded by the last rain. Above all this triviality and futility there was the tenuous blue sky of Titicaca, edged by clean mountains and clouds; and the eucalyptus stirred its leaves into a dry murmur of pleasanter places.

The *alcalde's* responses to our inquiries concerning the political affairs of his village were as laconic as might have been expected of Mist in the Face, Wrinkled Meat, or some such aboriginal notable of the northern continent. It was not through him, therefore, that we learned of his public functions, which are the maintenance of order, the decision of petty disputes, and military leadership, should there be need of it. As for the *ilacata*, who seems to divide with the *alcalde* the duties of the *cacique* or chief of ancient times, his tasks lie in the division of land each year upon a somewhat socialistic communal plan, and the collection of crops from common ground.

Having paid our respects to these solemn autocrats, we went on to inspect their subjects, indifferently populating the square. It was difficult to avoid thinking of these dyed and coppery creatures as vassals in some feudal system rather than as citizens in a modern republic.

We paused to photograph a group of women carding, spinning and knitting alpaca wool, but pride and shyness at first made them hide their faces or move angrily away. Only when money was a visible consideration, or when a group of them were found to be more than usually *simpatico*, would they permit this boldness. Their spinning wheels were of the most primitive design, a small wooden disk pierced by an 18-inch stick, motion being maintained by a constant twisting between thumb and forefinger. Like the North American squaw, these women seemed less ornamental and more useful than the easeful male. They were always busy and usually burdened, either with a bundle in the pouch-like shawl slung across their backs, or with a black-eyed infant.

A church, facing on the square, was as inevitable to Yunguyo as to any other New-World outpost inheriting the tradition of Catholic Spain. An Indian urchin, escorting us, grinned wide-mouthed at our interest in the tawdry and disintegrating images that are carried in religious processions. Nevertheless he knelt, taking his cue from a visiting *padre*, rising when the priest rose and exhibiting the expression of simple virtue common to those who do conventional things without troubling why.

The church was dismal with age and disrepair, and yet it was by no means out of keeping with the village it served. As usual among the small towns of interior Peru and Bolivia, it was larger than any other structure. It might well have been a civic center, for the village seemed to have been built around it. And yet its interior did not recommend it for any such gregarious purpose. It was dank and ill-lighted, suggestive of a mortuary rather than of a meeting place. It extended no rose-windowed welcome, but repelled, rather, by its austerity. Reed mats partly concealed the nakedness of the clay floor, which was unfurnished with pews, in the South American rural fashion. A worshiper must bring his own chair, or send it in charge of a servant; even so it is not to sit in, but to kneel upon—a curious, low-seated, high-backed affair, so made as to defeat any other purpose. The dust of generations lay in corners, and there was an air about the place like that of old temples in China, whose incense has kept the gods asleep these hundreds of years.

Peruvian street vendor.

Bolivian Indian woman at work with her distaff. There is a quid of coca in her cheek and a second child in the roll across her back.

A clatter of children's voices, reciting lessons in dissonant unison, enticed us into the *patio* of the adjacent school building. Further intrusion brought us abruptly into the presence of a gracious *chola* school teacher and her flock of girl pupils. All 11 of them, various-sized, stood promptly and remained demurely at attention until our departure. A map of the Americas hung on the wall, and Yunguyo was marked out larger even than San Francisco. The smaller girls in this public *escuela* appeared to be concerned principally with the exercise of arranging kernels of corn into letters of the alphabet, and the larger ones affectionately wrote interminable "mamas" into their copybooks. It was evident that, like their teacher, the girls were of combined native and Spanish ancestry. There was no definitely white countenance among them, nor was there the unbleached copper of the unalloyed Indian. Aside from an Italian shopkeeper, and very likely a Spanish priest, there was no visible white population in Yunguyo; and as for the Indians, they do not take over-kindly to matters of education.

The public *escuela* for boys, had we discovered it, no doubt would have exhibited a larger enrollment. Women in South America have not yet insisted upon co-education, nor upon equality with men in educational privileges. Theoretically the gospel of universal instruction flourishes, but in practice it falls far short of the mark. Statistics proclaim that half the population of Peru and Bolivia are not only illiterate, but cannot speak the Spanish language, that mellifluent tongue pronounced by Charles V to be *el idioma de los dióses*—the speech of the gods. The Indian cares little for this divine idiom, but clings tenaciously to the old dialects of Quichua and Aymara. He is satisfied, as a rule, when he has learned to scribble his name, so that he may qualify for whatever material advantage there happens to be in exercising his franchise as a voter. In Colombia, according to that government's statistics, one person in 22 attends a public school; in Ecuador the ratio is one in 16, and in Bolivia it is one in 45. Peru has approximately a million children of school age, less than one-fifth of whom are in public school. Chile exhibits a better record, three out of seven children being enrolled, and Argentina's ratio of public school pupils to population is one in 10, one-half that of the United States.

The Latin-American is boastful of his ancient universities. There is the *Universidad de San Marcos*, at Lima, for example, older than any similar institution in the United States. It was founded, with Salamanca as a model, nearly a century before John Harvard contributed his handful of books in a parallel cause. Today, however, it has not much to recommend it except venerable antiquity. There are excellent modern secondary schools and universities, particularly in Argentina, Chile and Uruguay, but they are designed for the genteel minority rather than for the mass. The public elementary school in most of the South American republics does not lead up to the *liceo*, or high school. Private instruction is necessary to prepare for the higher public institutions, and this automatically gives the system an aristocratic cast. The *gente decente*, except for an occasional democratic and usually academic reformer, is not greatly interested in education for all. Why, it would be argued, put notions into the peon's head, disturbing the dull contentment with which he now performs his allotted tasks? This resistance from above abets an inertia from beneath, for the humble are not yet able to see clearly how learning will put more money into their pockets or lift them any higher in the social scale against the firm intrenchments of aristocracy.

Peruvian Alcalde, with his silver-ringed staff of authority.

Scarcely beyond range of the chorused voices of the girls' school gleamed the new whitewash of the Italian's store. Its interior was not unlike those of similar rural establishments elsewhere in the world. The stock was a curious mixture of general merchandise, collected from widely dispersed sources. There were canned vegetables from China and the United States, tinned biscuits from Glasgow, calicoes and colored handkerchiefs and festoons of garlic from Italy, sweetened chocolate from California and bitter, cinnamon-flavored chocolate from Cuzco. Bales of *coca* leaves from Brazil, bottles filled in various wine cellars of Europe, and cigars rolled in Havana, evidenced by their proportions the importance of their position in Yunguyan society.

Yunguyo lies upon the neck of a peninsula, nestling among small but well-cultivated fields that slope gently toward Titicaca's reedy shores. Outside the central square there are only a few muddy, aboriginal paths leading past half a hundred adobe houses and mud-walled enclosures. In these narrow alleys we rubbed shoulders with crowding burros, and there was at our heels a swarm of ragged urchins, who seemed never to have met with the accident of immersion in water. Pigs, less cultured even than their fellows of the north continent,

(*Concluded on page 7*)

The Wisdom and Patriotism of Peter Cooper

The Greatest Business Man of His Time Had Ideas on the Money Question Which Are Amazingly Modern: Read Them

Peter Cooper was the Grand Old Man of his day. The following striking extracts from Mr. Cooper's works possess more than a merely historical interest.

CONGRESS should at the earliest opportunity create a currency based on the property of the nation, reserving gold merely for foreign exchanges, so that speculators could not interfere with it.

The Constitution was designed to establish a government of the people, for the people, and make it a shield of protection for the unsuspecting masses against those who are resorting to all forms of art to obtain property without labor. The framers of the Constitution would never have recommended one kind of money for the government, another for the people and another for the banks.

Nearly all the financial laws that have been passed during and since the Civil War have been passed under the advice and in the interest of a class of men who have been allowed to control the moneyed interests of our own and other countries.

They Had "Deflation" Then, Too

THE panic of 1873 and all the consequent distress of the industrial classes of the country and its baffled enterprise were distinctly due to the contraction of the currency during the eight years preceding. It stopped credit, production and consumption, and made much of what currency was left, rush in a panic to the head money-centers—as the blood, in an apoplectic fit, rushes to the head—where this money is now vainly seeking investment in first-class security at two per cent; while the country at large is palsied in its enterprise and industries for want of this very currency.

If crime is to be measured by the misery it produces, the act of taking from our people their money and converting it into a national debt must rank as one of the most unjust and cruel acts ever known to any civilized legislation.

Instead of contracting their currency as our government has done, the French Government, after the war with Germany, in 1870, added some 250 millions more to their paper circulation and in addition to that increase of their paper money, their government authorized temporary loans to be made on goods by all principal cities of France. This wise and just policy saved France from the terrible consequence of a panic such as was brought on our own country by an unjust and unwise contraction of our nation's currency—a policy that brought wretchedness and ruin to the homes of millions.

Wendell Phillips Also a Crank!

WHEN a man strips to fight for his life, he puts himself in the condition and posture to do his best. When a nation girds herself for a last desperate struggle for existence, what does history tell us she has uniformly done? History tells us that a nation in such extremity has uniformly thrown off every incumbrance, stopped every drain upon her resources, stimulated every power of production, economized all her means and guarded herself as carefully as possible from all foreign interference with her business prosperity. How has she secured and effected all this? History answers, "By resorting to a paper currency." (Quoted approvingly from Wendell Phillips.)

It should always be remembered that debt, in all ages of the world, has been the most effectual means of holding the mass of mankind in a species of enslavement.

Put Money Back in U. S. Control!

HERE is precisely the point of departure of the moneyed class from the people at large. They wish to monopolize, not only *private*, but all *public* credits. All credits under the sanction and provision of law and the government ought to be *public* credits, for which the government alone should be held responsible. Such is any paper currency now, even if it is not legal tender. Nothing but a legal sanction can pass a bank note into the circulation of the country. The credit of the bank is indorsed by the government, in order to be regarded as good. The government, under the present system, often borrows its own indorsement! The first point of departure I would have from this whole system of finance is that everything, gold, silver or paper, that passes into the circulation of the country, as money, should have the government's image and superscription upon it, and should be issued and controlled entirely by the government so that there shall be no legalized money, directly or indirectly, belonging to private corporations. This is a part of that special and class legislation that I have always contended against as the bane of Republican institutions.

By JOHN BASIL BARNHILL

Another oligarchy, another enslaving power, is asserting itself against the interests of the whole people. There is fast forming in this country an aristocracy of wealth—the worst form of aristocracy that can curse the prosperity of any country. For such an aristocracy has no country—"absenteeism," living abroad, while they draw their income from the country, is one of its common characteristics. Such an aristocracy is without soul and without patriotism. Let us save our country from this, its most potent, and as I hope, its last enemy.

I think that the neglect of our several administrations to make laws that shall properly regulate the currency, both in volume and value, has been a greater cause of demoralization, want and misery, among the mass of the people, than all other causes combined.

There is nothing that can be more important than to find out and remove the causes that are bringing bankruptcy and ruin to the homes of millions of the most industrious men of our nation.

Writing in 1877, Mr. Cooper said: "The Southern people need only money, wisely distributed among its working and enterprising population; and it was well said, lately, by one of the Southern statesmen, that "the government had impoverished, discomfited and crushed the South more by its financial policy since peace was declared than by its arms during the whole War of Rebellion."

Daniel Webster, Too!

DANIEL WEBSTER says: "When all our paper money is made payable in specie on demand, it will prove the most certain means that can be used to fertilize the rich man's field by the sweat of the poor man's brow."

It will do this by insuring the periodical return of those scenes of panic, pressure, general bankruptcy and ruin that have so often changed the values of all property and labor some 25 or 50 per cent in a single year, whenever it was for the interest of foreign creditors or merchants at home to withdraw a few extra millions from our banks, as they did in 1857 when a withdrawal of only seven millions produced the panic of that year which sunk the values of all property of our country to the amount of thousands of millions of dollars. These millions were taken from the farmers, mechanics and merchants who were in debt and put in the possession of those who had the means to buy at the ruinous rates at which property of all kinds was compelled to be sold, thus making, as it ever must, the rich richer and the poor poorer.

It would seem as though a President and his Cabinet and Congress, with all past experience before them as a guide, might have avoided the distress brought about by the specie resumption of 1873. If the resumption act was due to ignorance or carelessness it would be reprehensible; if due to anything else it should be punished as treason.

Was John C. Calhoun Also Deluded?

I FEEL that I hazard nothing in asserting that the banking system, *through its connection with the government,* is effecting, and if not arrested, will effect, one of the greatest revolutions in the political and moral condition of the world, of which history has left any record; and, let me add, one of the most pernicious. If permitted to progress, it will elevate the money power above all others—above thrones, and principalities, laws and constitutions. It has already acquired in our country an almost unlimited control over the fortunes of individuals and the business of the community. By granting or withholding favors; by expanding or contracting the currency, fortunes are made or lost, and the whole business of the community, through every channel of industry, is made to prosper or decay. Neither good nor bad seasons, neither the smiles nor the frowns of Providence, exercise a more controlling influence for good or evil, over the fortunes of individuals or the community. It is in vain that the bounty of heaven shall bless the land with seasons of plenty and health; a sudden contraction, or a suspension of payment, spreads ruin and desolation around and plunges into poverty thousands who, but a moment before, believed themselves to be independent and in affluent circumstances. (Quoted with approval from John C. Calhoun's great letter of September 6, 1838.)

The substitution of greenbacks for national bank notes will make a uniform currency of money. A greenback legal tender is to the full as much real money as a gold legal tender, the only difference being, that *as many nations make gold a legal tender, there is more demand for it than for paper legal tenders which have the sovereign stamp of only one government.*

This whole system of issuing money and making it a gratuity to rich bankers is one of the most infamous frauds ever perpetrated upon the people. Can any plausible reason be given why the government should issue $362,000,000 of notes and endow such notes with the function of money and practically make them a free gift to bankers, while the masses of the people have to work for every dollar of this money that comes into their possession? If this volume of currency was issued in the form of legal tender notes, the working classes of this country would supply for it the labor and material requisite to build two lines of double-track railroad from the Atlantic to the Pacific Coast and fully equip those roads and in addition thereto construct 50 first-class ocean steamers by which the question of cheap transportation, both at home and abroad, could forever be settled in the interests of the people.

On March 30, 1882, Honorable Richard Warner, M. C., of Tennessee, proved in Congress that the banks, deceitfully styled national, have made out of the people the enormous sum of $1,848,930,000 in the 16 preceding years, leaving the national debt, at that time, nearly as large as it was at the close of the Civil War.

They Did, Practically, in 1914

IF ENGLAND and France were tomorrow to demonetize gold and silver and make their treasury notes the exclusive legal tender of their respective realms, they would immediately be at a premium over gold. Venice practically demonetized gold and silver in large transactions, her paper was accepted as legal tender and was at a premium over gold for several centuries; sometimes as much as 30 per cent premium, so that a law was actually passed, prohibiting the charge of a higher premium than 20 per cent.

It is a remarkable fact that the most essential element of our colonial and national prosperity was obtained by the use of the legal tender paper money—the very thing that our present rulers seem now determined to ridicule and bring into contempt. We are apt to forget that the Continental money secured for us a country and the greenback currency has saved us a nation.

"I Have Seen Ten Money Panics"

ONE of the best business lessons of my life I learned at the time of General Jackson's war upon the United States Bank. I thought that I saw, as Jackson did, the terrible danger which resulted from allowing the corporations to control the money of the country. Even in the hands of a good man, such an institution as the second United States Bank, chartered with the privilege of controlling a capital of $38,000,000, loaning, as it did, $4 in paper for every dollar it controlled by its charter, was fraught with grave danger. That bank had the privilege of opening a branch in every state, with authority to issue what was called United States money, based upon this charter which was actually obtained by giving $1,500,000 to the government, and as Mr. Benton says, in his "History of Thirty Years in Congress," the advocates of that bank spent $3,000,000 in bribing Senators, members of the House of Representatives and editors of newspapers for the accomplishment of their purpose.

The ten panics in the money market that I have myself witnessed have been brought about by the people becoming dependent for their business operations upon bank accommodations, which have been too suddenly withdrawn from them, so that they had to make the most heartaching sacrifices to pay the banks. As I now recollect, I think that even a barrel of flour rose to the price of $18.

They Were Against It

SECTION 9 of the Constitution says: "No money shall be drawn from the Treasury but in consequence of appropriation made by law; and a regular statement and amount of the receipts and expenditures of all public money shall be published from time to time."

The money transferred to the national banks is issued in bulk, and not by virtue of appropriations. The issue is not for the benefit of the government, nor for the benefit of the people. It is issued solely for the benefit and profit of individuals, in defiance of that general welfare which it is the duty of the government to secure, and of the foregoing provision.

It is an inexcusable, unnecessary and unequal favoritism thus to benefit a privileged class. Jefferson, Franklin, Madison, Jackson, Calhoun, Benton, and a long line of statesmen have declared against the delegation of the power to coin, issue or regulate the money of the nation to banks and bankers and it is time that an end should be put to it. We have learned to appreciate national resources and credit as the basis of national money and national financial power as distinguished from individual financial power.

Why Not Tell Them?

THE spectacle of Paderewski, the renowned pianist, guarded by American police in the great cities he has visited, is one of the daily occurrences that should give citizens pause if they were not so enmeshed in a thousand other like occurrences. The newspapers of the United States, with hardly an exception, have deliberately denied their readers the explanation of these outbreaks, while faithfully enough chronicling the fact that the outbreaks have occurred. Newspapers which give Column One, Page One, daily to the Jewish propaganda against the Klan offer double proof of their subserviency to what St. John calls "the fear of the Jews" by blue-penciling the cause of the insults offered to Paderewski. In Canada, where the press is still comparatively free, the news was given. In the United States, it is not given. On which score Canada is proving herself more American than the United States.

The truth about the Paderewski outrages is that the Jews of America conceive his eminently fair administration of affairs in Poland to have been anti-Semitic. Paderewski made the mistake of supposing that the Jews only wished justice. He gave them justice, and found that what they demanded was privilege. He gave them equal rights, but discovered that they desired their rights to be at a ratio of 16 to 1 of the common rights. They demanded all that the Poles had and more. It was injustice to the Poles they demanded, and Paderewski could not concede that. The result is that the "emancipated" and "liberal" Jews of the United States have made it necessary for the police to protect the great artist on his tour here.

In Europe they know all about it. The news is cabled thither with an air of "see how powerful are the Jews in the United States; they can do what they like with Paderewski," while here the people are told nothing—nothing. "Freedom of the Press" is a principle to be soft-pedaled, it simply does not exist, in the absence of Frankness in the Press.

You Don't Agree With That Article? Why Not?

THE man who sets out to please everybody will end by pleasing no one, least of all himself. The newspaper or magazine that sets out to chronicle the neglected truth will discover as much partisanship among those who are demanding "the truth" as among any other class. Most people want to hear and read the things they agree with; the thing that does not fit into their system is "a betrayal of the truth."

It is a good rule to read something you are not likely to agree with, that is opposed to the system you hold; its benefit is like that of the wind to the trees—tossing the mind by a contrary opinion will root it more deeply. It is scarcely possible to know why you hold a present opinion until you know why you reject its opposite. On public questions principally it is necessary to know both sides to hold an intelligent opinion on either side. In this country we have reached the conclusion on certain important questions that neither party was wholly right and that the national right was obtainable only by a scientific combination of the two party principles into one unpartisan policy. Such a decision would have been treason 50 years ago, but as intelligence becomes less prejudiced it is more and more the process that commends itself.

The Dearborn Independent deals with many questions of public import to give as wide a range of view on these questions as is consistent with forward-looking discussion. The Dearborn Independent does not indorse all the views expressed under the signatures of its contributors. It does, however, regard those views as worthy the consideration of the thoughtful reader, and it further vouches for any statement of fact which may be made. Facts may be checked, conclusions are another matter. We may be absolutely certain about facts. The Dearborn Independent expresses its own opinion in editorials or in the unsigned articles which appear. Articles written by members of The Dearborn Independent staff are not signed.

Among the more than a quarter million subscribers to The Dearborn Independent there are a few—we hear from some one of them regularly—who have been disturbed by seeing a fresh view of an old question, or who have been quite upset by the publicity which is given to an idea they do not agree with, and who think therefore that this paper has betrayed the cause of the truth! They find it difficult to conceive of a policy which permits the expression of an opinion with which even the paper printing it will not agree. But this is the essence of free speech; more than that, it is the essence of sound thinking. We are a propagandized people and we have only ourselves to blame. The people have been crying so long for what they like and nothing else, that now the corporations through their vast publicity agencies are giving them what they would not want if they knew what it was.

The people read nothing about Muscle Shoals in the papers except what a publicity agency spreads upon the wires. Sometimes the very proceedings staged in the Senate are propaganda which needs an official start on the publicity program marked out for it. There is a publicity agency which combines the curiously ill-assorted duties (until you see the connection) of keeping Rosenbluth from trial and keeping the Alabama Power company in power—and it is officered by one of the best of the German war correspondents. Even the new theology of Harry Emerson Fosdick has been sponsored by one of the biggest corporation publicity experts in the country. The League of Nations propaganda, soon to be let loose on the country, will take a large corps of men and women who have lately assisted in the world charity drives, and will turn them into an army of automatic speakers for this particular idea. Everything is regimented, organized, operated by a push button from a headquarters which the public is never told about. Everything is pushed to the utter exclusion of everything else; it is made increasingly impossible for the people to form broad views based upon a variety of outlooks and all the pros and cons.

Lloyd George Denounces Himself

WE HAVE flattered ourselves that, though politicians may be what they are, there is a higher race of public men whom we call Statesmen. It is admitted that even Statesmen sometimes play politics, but that has been excused in view of the ends they seek; it is thought necessary to play politics to obtain statesmanly ends.

The flattery no longer comes with ease, for the race of Statesmen has either sadly diminished or disappeared into retirement. The Big Men are exceedingly little and even mean in their methods, they are like Supreme Court Justices playing the pettifogger, and it is increasingly difficult to distinguish them from politicians. The trappings of state have fallen from them and they are left almost indistinguishable, except for a certain grand manner, from the common run of job-holders and seekers after power—power which is always used, not by the official holders thereof, but by concealed advisers.

Latest of disclosures is that of Lloyd George. Lately he was a Statesman. In a very violent manner the people replaced him among the ranks of the politicians. The ease with which he has adapted himself to his new position shows that he was never anything but a politician. In his first speech in Parliament he proceeded with a wealth of statistics and rhetoric to blame the Government for the condition of England! He showed how a dozen important and even vital matters had been neglected—matters so vital that their neglect bordered on treason to the Realm. And what is more, he made good his showing. There was not the least room for doubt that he spoke the truth.

But—Lloyd George was the Government which permitted that state of affairs to arrive. From the Opposition benches he now hurls at Bonar Law, as head of the Government, blame for the very things which were established under Lloyd George's government. He changed from Statesman to Politician in a day, denouncing a day-old Government for the mistakes which he himself had made for six years!

Whether he expected the British public to be taken in by his words, no one can say. It is noticeable, however, that the British press quite solemnly refuses to see the joke. Lloyd George, leader of the Opposition, denouncing Lloyd George as leader of the Government, is almost too good to be true, but good or not it is true, and the substance of the denunciation is doubly true. Lloyd George, it is now clear, was not a mistaken Statesman, he was a misfit politician. The pity is that he is not alone.

The March Into Germany

INFORMED people are not surprised by France's march into Germany. The wonder is that it has been so long delayed after being so definitely foreshadowed. But no one is well enough informed to see what the end shall be. France has determined to go it alone regardless of world opinion. She feels that the world does not understand her position and wilfully refuses to share her emotion, and she has, therefore, decided to make the best of the power she possesses to prove herself still to be a factor in world affairs. Any nation choosing that course could become a factor in world affairs. It means, as the trouble ostensibly between Greece and Turkey meant, that France is cutting loose from her allies.

The cause is simple: Germany has not delivered to France the amount of coal allotted to her under the reparations agreement. It is so simple that in America it is difficult to understand what it means. It means principally that with Germany herself suffering from a serious fuel shortage, German workmen revolt at the thought of digging coal the year round and sending it to France. There can be no question that, having rendered French mines useless by the scientifically fiendish devastation of war, Germany is bound to repay. But that is not the only element of the question. Of two men in a fight, the attacker should be compelled to make good, but if the attacker himself is in the hospital because of the wounds he received in his attack, there is also the question of ability to perform; and that is the situation in Europe. It does not settle anything to decide where justice lies, for it is a complex of injustice on all sides which human ingenuity has failed to untangle.

It all comes to this, probably, that the loom of fate is weaving the strands of further unsettlement and disaster. The situation must be considered as a whole, and not as merely French or German, and, of course, this is impossible for any European country to do. This incident may pass for the present without apparent result. It appears to have been diplomatically managed thus far. But in the future it spells the line-up of a new Mediterranean alliance, with Poland, Rumania and Turkey certainly with France, a line across Southern Europe, broken only by the possible refusal of Italy to take part. And that most certainly means a visible preparation for another struggle.

Today it is possible to observe almost hour by hour a resistless destiny setting the scene for the real Armageddon, the Last War, of which the Great War was the preparatory chapter. The Great War was fought by ill-assorted allies who normally would not have been allies. Now the natural allies will find each other, and not the least surprising element of the new alignment will probably be that Germany, perhaps separated from some of her present kingdoms, will be lined up with her former enemies, allies of Britain and America. Rightly or wrongly, that seems to be the way the finger is pointing.

And the Frogs May Get a Stork for King

THE final elimination of the name of former Governor Harding from the list of possible successors to his position on the Federal Reserve Board is a reminder of the possibility that the people who clamored for it of the fate of the frogs who desired a new king. It is now some six months since The Dearborn Independent announced that he would not be reappointed, and during that period it has not for a moment felt that influences brought to bear in his behalf would be successful. Not all of these influences were sincere, for the matter would have been settled long ago if others could be decided between.

Justly or unjustly, Governor Harding represented in the public mind the board which was charged the "silent panic." His responsibility is unquestioned, as is that of every other member of the board, but that he was alone or chiefly to blame, is doubtful. However, a sacrifice must be made, and his place coming under consideration first, he was chosen as the "goat." At that it might have been questioned whether, had approval of the administration in the fall elections resulted, there might not have been temptation to challenge public disapprobation by reversing promises made soon after the vacancy occurred.

The personal request from Mr. Harding himself that he no longer be considered available was dictated by good judgment, and ended the matter gracefully.

Now comes the question: Who shall be appointed to succeed to the office? The President must be wise, he must be firm in this matter. There are Americans who can fill the office with credit to the Administration and in the spirit of service to the people. There are Americans who can do this. The President is not compelled to look to the agents of International Bankers for a governor of the Federal Reserve Board. The President should resist with sternness any attempt to gain appointment for a man whose Americanism is recent or financial or in any way shadowed by connection with the Internationalists of no patriotic convictions.

Mr. Ford's Page

WILL the European situation be composed, or will it drift into further trouble? The question is asked everywhere, and variously answered. Sometimes in meeting with a European you think you get a glimpse of what the trouble is. Especially if that European be one of the former leaders of the people. You are conscious as of a belt that has somehow slipped off the pulley of progress.

Of course, if Europe is not composed there is little to look forward to but a slump into more of the same kind of trouble which we thought was stopped by the Armistice. Perhaps nothing can prevent it, whatever we may do. It is a terrible thought, but truth sometimes compels us to think terrible thoughts. Disasters come upon a people not from warnings heard, but from warnings unheeded. When you consider that every kind of war-stimulus exists now that existed in 1914—when you consider the far more startling fact that every kind of war stimulus is far more active now than it was in 1914 and that the so-called "war weariness" has apparently not devitalized it at all, it rather stills the tongue of easy optimism.

> *THE states of Europe are disunited, and that is the whole trouble. Too many boundary lines, too many tariff walls, too many hindrances to the development of a strongly built system of industrial self-service. Most of these divisions are built on long-fostered ideas of enmity, whose principal use has been to supply support for an idle aristocracy. Nothing of any real worth can be accomplished for Europe in the present state of affairs, any more than could be accomplished for this country if each of our states was filled with a race and nationality different from surrounding states. A United States of Europe is an absolute necessity for the settlement of the problem, and this is not to be expected as the result of reason and good will. It will probably come after further fires have purged away the dross of centuries.*

If Europe could be taken up bodily and set down in the midst of the United States, we could guarantee, if not a complete settlement, at least a workable peace. Europe in the United States would no longer be a group of small and important states, bristling at each other bantam-like across their miniature frontiers. We have taken into this country men and women and children, old and young, rich and poor, progressive and backward, from every land in Europe, who have lived here and prospered, even if their living and prosperity has cost us rather heavily in some respects.

The experiment we have thus made in taking sections of Europe and setting them down in the United States is very valuable if we do not make it mean what it does not mean. We have very probably been deceiving ourselves in most of our talk about the "melting pot." The proof of the melting pot is not in the pot, nor yet in the elements which we have assumed would be sufficiently potent to reduce our cosmopolitan mixture to a solution; the proof of the melting pot is in the fact that the contents melt and fuse.

Have the contents of our national "melting pot" melted and fused? No. Races akin to each other have, of course, become more closely associated. People who are not deceived by mere national or political divisions between peoples are not surprised at this. On the other hand, people who think that crossing national divisions is a great triumph in the amalgamation of the races are much mistaken. There is no "melting pot" when a Canadian marries an American, nor when branches of the British stock marry each other, nor yet when branches of the Saxon race intermarry—and that extends over a number of political boundaries in Europe. Where you come against strong racial types, they do not melt nor fuse. The "melting pot," as we have been considering it in the United States, is a pleasant fiction. Blood is the most persistent element in the world.

But, even though we have not fused the races, we have done something else: we have shown how the races can live and work together in the same land under the same government without interference from their racial prejudices. It is true, of course, that this phrase "living and working together" is not quite accurate. The races crowd into sections by themselves, forming towns within towns and communities within communities; and when they work they are usually engaged in gangs of their own kind of people. They remain to large extent foreign communities in our land, excepting, of course, such of those as are naturally and instinctively fitted to receive the American idea, and with it the people who hold it. But with all these provisos, which have been overlooked too long, it is still true that in the same land and under the same government sections of all the races of the world have lived and worked without open racial or national strife.

Now, what has enabled them to do so? Simply that they have had no outlet for the expression of their idea of political superiority. In Europe they could all make faces at each other across their little frontiers, swing their swords and enter upon their small make-believe dramas of patriotism. That is what they do most of the time. Their little governments must do something to impress the people with their importance and to serve the interests of those whose wealth depends on war. But in America there was nothing of that; their little countries, dear to them in sentiment, as is right, appear very small when compared with the United States, much smaller than some of the states themselves. All Europe looked small when compared with the United States. The cockpit of Europe expanded into a wide plain where the people worked instead of fighting, built homes and engaged in the labor of construction instead of the hideous work of sweeping away the labor and the loves of men. True, certain sections of our newcomers brought much of the destructive spirit with them, and it is apparent among us today, but in the main they lived in the United States as units in a constructive order.

If—and it is a big "if"—if Europe could be engaged as a whole on the economic task of making a rewarding life for the millions, the problem would be solved. But what would this mean?

It would mean, to a large extent, the disappearance of much of what we know as European. Many of the countries are not large enough to constitute a modern market, therefore no industrial enterprise can be undertaken in which the people can share as large wage-earners. Every little distance there are customs barriers. Free conditions of trade do not exist. Little countries that cannot possibly be self-sufficient in a modern industrial way, because their total territory does not offer market enough to sustain modern industry, are nevertheless straining to live within themselves, and they blame their neighbors for their failure to do so. From this come jealousies and wars. These customs boundaries, whose principal use is to support an aristocracy and an army, must disappear.

With them must disappear the aristocracy; that is to say, the purely ornamental classes must begin to contribute to the general welfare. This does not mean, as in Russia, the destruction of the well-born; it means the destruction of the idea that one class has the right to live off the labor of another. There is too much of that throughout all Europe, even in the most enlightened portions. There is more of it than has ever appeared in the United States, although it is true we have more of it here than we should have. There is room for leaders, and leaders who teach the people how to realize their highest possibilities are among the greatest contributors to the general welfare. This aristocracy is not always titular and hereditary, it is often financial. Men who gain wealth by their wits, by dealing in bits of paper on the exchanges, are not as a rule helpers of the general welfare. They are, when all is said and done, speculators in the labor of the poor, and the day is coming, not far distant either, when their trade will be a disgrace and their wealth a shame.

All this means a United States of Europe, each part serving the rest as natural resources and native ability may make possible. This is the only way for Europe out of her trouble. But how far Europe is from seeing this or, seeing it, how far she is from the willingness to do it, needs no discussion.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

"It's Funny," Says N. C. Wyeth, "How Far a Man Can See From His Own Doorstep"

America's Greatest Painter of "Costumed Romance" Finds More Artistic Thrill at Home Than in Nineteen Years of Picturesque Roving

By LEE D. BROWN

"HOME-KEEPING hearts are happiest," said Henry Wadsworth Longfellow. And now the career of the grandson of one of Longfellow's old cronies suggests the addition of a new line:

"Home-keeping men go farthest!"

The grandson is N. C. Wyeth, one of America's most famous artists.

He was born in Needham, Massachusetts, 40 years ago, and he has recently bought his grandfather's old farm and returned to capture on canvas the magic inspiration which completely failed to stir him in earlier years.

Longfellow's poem, "To the River Charles," was written in the present Wyeth home, while the celebrated poet was visiting Wyeth's grandfather there, and the River Charles itself skirts the edge of the little farm. Young Wyeth used to slip away to the opposite side and cook out-of-door meals of bacon and eggs on its shore, but as for finding Inspiration in that little stream—it just wasn't there! It might inspire a poet, but not Young Wyeth. His heroes were cowboys and Indians, and it was the wild and woolly life of the western plains that he longed for—then.

Between laborious farm work and his love of the out-of-doors he didn't find time for any of the exciting classics so dear to the hearts of most boys. "Robinson Crusoe"—"Treasure Island"—"The Last of the Mohicans"—"Scottish Chiefs"—"Robin Hood"—"The White Company"—wonderful boyhood treasures all of them, with a strange power to replace the world of drab parents and teachers and deadly chores with a gayly costumed world of Romance, Danger, Thrills and Adventure—they were all closed books to him. He was an unusually husky lad who would probably make a good farmer but, it was thought, he didn't have very much imagination.

Between that time and the present Wyeth has painted more than 200 great canvases—pictures enough to constitute the life work of an average artist—of the characters and breathless scenes from these very books and others like them. And they've won him world-wide fame, and the reputation of being "America's greatest painter of costumed romance."

This proves again, incidentally, that ours is an age of specialization, in art as in every other occupation.

But the greater editorial written by Wyeth's career is this:

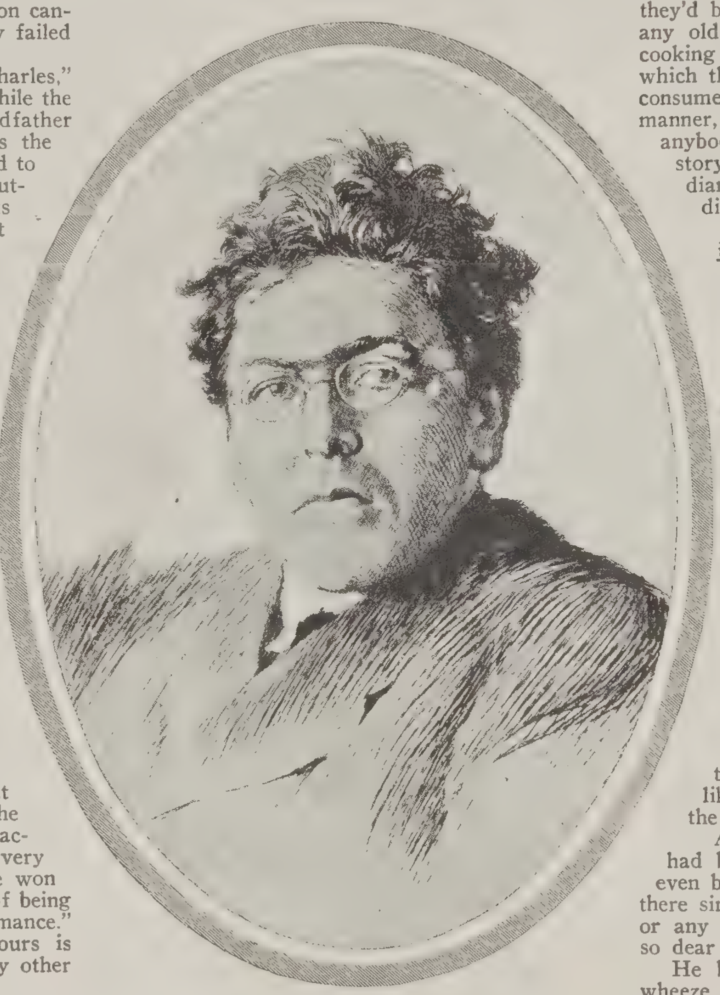
He searched the world over for atmosphere, and to get the "feel" of the vigorous sort of pictures that he wanted to paint he actually lived a number of the experiences which he depicted on canvas—then to his own surprise he discovered that the quest for inspiration led right back to his own front door. The well-known Blue Bird of Happiness is not the only one that hides unsuspected at our doorstep.

It was after what seemed to him ages of hard study, first in Boston and then under Howard Pyle in Delaware, that Wyeth had his first choice of places to go. That was 21 years ago—he is now 40. He resolved never to be a "hitching post artist" and determined to paint vigorous action, spirited horses, heaving billows and brawny men, for these were to his liking.

It was on a Colorado ranch that he learned to master an unbroken horse and throw a lasso. Nor did he learn as a visiting tenderfoot for the novelty of it—he got a job as a cowboy. For three months he had a hilarious time in this job and then decided it would be good sport to make a trip by stagecoach from Durango, Colorado, to Farmington, New Mexico. The stage was drawn by a team of eight horses, and Wyeth felt sure that these, in action, would make a bully good study in the kind of pictures he loved. The coach being full, he got up beside the driver. And, as luck would have it, before the day was over—a steaming hot day it was—the driver had contracted a splitting headache. He scrutinized the six-foot-two-inch stranger riding beside him, and finally asked:

"Say—d'ye think ye could handle this here coach if I dropped off at the next changin' place?"

"Sure," said Wyeth, who had never driven eight horses together in his life and knew nothing at all about the trail ahead. He did know, however, that an invalid was in the coach and a long delay in such scorching weather would not be the best medicine for that invalid.



N. C. WYETH,

America's greatest painter of costumed romance—an artist who insists upon living the vigorous sort of existence he paints before he ever puts them on canvas. In his quest for experience, he worked at different times as a cowboy, a stagecoach driver, desert mail carrier and boss of an Indian trading post.

At the next changing point, a roadside inn, he helped change horses, assisted the driver indoors, and took the reins. It would be a pretty stiff test of his nerve, but he felt lucky that day. He knew horses and credited them with more road-sense than he himself possessed. Also, the passengers were ignorant of his ignorance, and he couldn't afford to have them realize what a critical moment this was.

Once out of sight of the inn, he practically turned the job over to the horses, and whether it was that they didn't realize this or that they knew where to find their next meal, the trip proved such a success that Wyeth continued to drive this mail coach every day for the next three months.

Next—he chanced into an Indian trading post at a place called "Two Gray Hills," which Wyeth says is a perfect description of the place itself. He liked the "local color" and hung around visiting the man in charge of the trading post for two weeks. At the end of that time the manager had come to the conclusion that this was a heaven-sent opportunity for a rest, and asked Wyeth if he would mind taking charge for several weeks or a month. Wyeth wouldn't, and did.

"It takes quite a while to get used to seeing cowboys in overalls, patent leather shoes and derby hats," says Wyeth. "Perhaps the strangest part of it is that cowboys still contrive to be picturesque in spite of all this. And the Indians too—the type has changed—don't wear feathers and paint any more. Some of them still wear blankets, and I remember one huge fellow, completely encased in his blanket, who used to stride into the store and bang down a 25-cent piece—or, as he would have called it, "two-bits"—and in a deep voice he would demand:

"'Candy!'

"Then he'd march solemnly out with the bag and go around behind the shanty which was the trading post. Even inside the building you could hear him munching the stuff.

"Another habit of the Indians was to come to the post for an eight-pound bag of flour and a scoop of baking powder. They would take it to the nearest creek and mix well with water. Then they'd build a small fire and bake the dough on any old piece of tin they might find available, cooking it until it was about half done. After which they'd eat the mess. Many an Indian has consumed a whole eight-pound bag of flour in this manner, at one sitting. Of course, it would kill anybody else—and though it may injure the story, I've got to confess even the husky Indians weren't able to stand it very well. Indigestion was the curse of their community.

"Finally the manager returned to his job.

"I'd have enjoyed going right on with any one of those jobs for life! But there comes a time in the career of every man, whether he's an artist or not, when there's a yearning for self-expression of one sort or another. In my case I decided that this was all too much fun to call work, and considered it a vacation instead. I came back, and married, and settled down in Chadd's Ford to go to work."

And it was not until then that Wyeth made his discovery, and found his great opportunity.

The powerful action and bold sure coloring of his paintings commenced to build him a reputation as soon as he returned to the East. And soon after this a large publishing firm invited him to undertake a set of illustrations for a gift edition of one of the "juvenile classics" on their list. It was a book that "everybody had read," but that thousands of families would doubtless like to have in an ornamental edition for the enjoyment of the younger generation.

And Wyeth had never read the book! He had become an artist, and a farmer and had even begun to be considerable of a scholar, but there simply had been no time available for this or any other of the carpet-from-Bagdad books so dear to the hearts of all boys.

He became so interested that he forgot the wheeze about the illustrator being supposed not to read anything more than the title of the story he illustrates. His conscientious method is well shown by the paintings he has done this year for "The White Company."

Wyeth has also become known in recent years for another type of painting—he was last year commissioned to do two great 20-foot lunettes, representing two Civil War battles in Missouri, for the Missouri State House, and this year he was commissioned to execute two 10x11-foot murals representing two of the most acute financial crises in the history of the United States, for the Federal Reserve Bank in Boston. These have now been completed and hung. One represents a conference between Lincoln and his Secretary of the Treasury, Salmon P. Chase, who developed the National Bank Act in 1863.

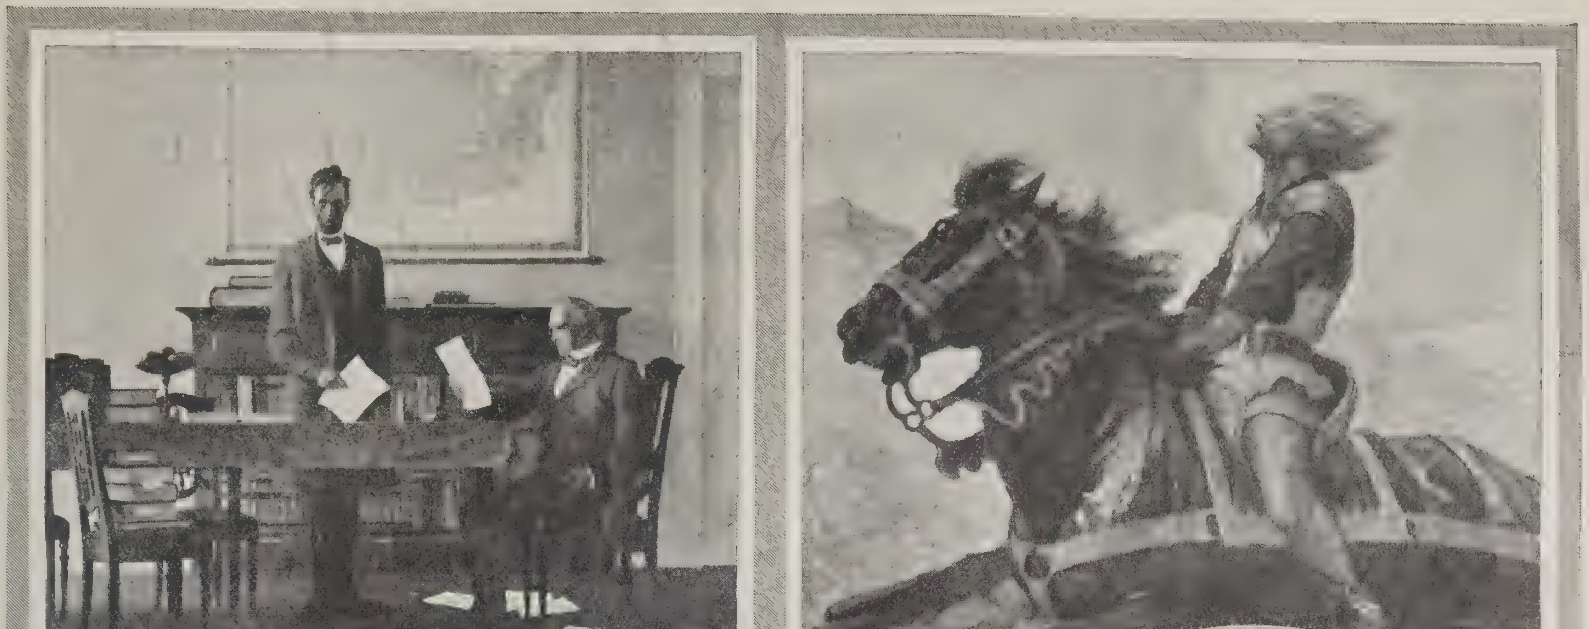
For many years N. C. Wyeth felt a longing to be back in his boyhood home on the little six-acre patch of land that had so completely failed to stir his imagination when he was a youngster. Finally the longing crystallized into action, and Wyeth bought his grandfather's farm at Needham and moved his trunk loads of paraphernalia, his huge wardrobe of costumes of all ages, his knights and princes, blood-thirsty pirates and frightened heroines—to say nothing of a family consisting of a wife and five children—back to the old home.

And since that time his critics say that the work he has done is his best.

"Do you see that farmhouse beyond the river?" he asked.

"That house was built in 1730, and when it was undergoing repairs not long ago, several Indian arrowheads were found in the rafters of the roof.

"My house was built in 1759, and was originally used for a roadside tavern. This summer we, too, were making some repairs beneath a win-



Above, left—This 10 x 11-foot mural painting was executed by Wyeth during the past year and now hangs in the Federal Reserve Bank Building in Boston. It represents a conference between Abraham Lincoln and his Secretary of the Treasury, Salmon P. Chase, who developed the National Bank Act in 1863 and thereby probably saved the Union from bankruptcy. Right—Imagine a boy mysteriously acquiring the power to bring his heroes to life on canvas as soon as he finished his first reading of the story about them. That is what has occurred in Wyeth's case, for he brought all of a boy's fresh enthusiasm to it—and still does. The above is the manner in which he visualized "Alleyne's Ride With a Message to the Prince," in Conan Doyle's historical masterpiece, "The White Company."

N. C. Wyeth and his family.

dow—one that had evidently been built into a space originally used for a door, the entrance to the taproom of the tavern. Under what had been the doorsill we found an old King George III penny.

"Go ahead and paint your own mental picture of that black old penny's last active history! Pre-Revolutionary costumes. Probably an old knee-breeked tippler stumbling out after a rosy evening with interestingly costumed cronies—unconscious that they were interestingly costumed. The price of one more mug of ale perversely rolls under the doorsill—to remain lost for a hundred and eighty years! Perhaps it's a snow-covered night with frosty black windows—perhaps all of the cronies get down on their wobbly knees to take part in the search—perhaps—oh, paint your own picture of the scene and you'll find a smile in every stroke! The coin may have been only a luck piece after all, put there by a fat and jovial but rather superstitious proprietor. The house was finally bought by my grandfather long after it had been converted into a residence.

"The house and farm remained in our family during the next generation, and now—well, I just *had* to come back to it! There's so much more to an old family place than you realize when you're a kid. Somehow, New England with all of its memories and traditions is—well, if you were born here, you can't forget during all the years you're away that it is home after all. Louis Aggasiz and Henry Wadsworth Longfellow used to visit my grandparents here. Father, with his farmer inclinations and training, was for 30 years an inspector of hay for the port of Boston. He was born in Cambridge and lived there until he married.

"On Sundays he occupied a church pew that quarter-faced the pew of President Charles W. Eliot of Harvard. And throughout the many years they reached only a nodding acquaintance!

"New England boiled down to two sentences!

"As a youngster I remember seeing President Eliot do a terrible thing. Just once. A visiting clergyman so completely aroused his enthusiasm that he clapped his hands in church!

"New England—contradicted in one.

"Why the whole neighborhood—the near-by houses, the River Charles, every one of the fields—all fairly teem with the romance of years gone by, of years when New England was old while the rest of the country was still new. It's interesting, how far a man can see from home! Thoreau spent a lifetime in Concord and used to say that we find the whole universe in the things around us. And Rembrandt did his greatest work painting the canals behind his house, and the beggars who came to his door."

Main Street in the Andes

Concluded from page 2

made insolent dispute with us over the right of way. Oxen resembling the sacred cattle of India chewed their cuds at us from over the walls of clay bounding diminutive fields, and Indians in rainbow-colored ponchos passed with a *"buen' dia'"* or interrupted their work in the fields to gaze at us. A small Indian girl played solemnly in a fence corner with three bristly black pigs and a yellow dog. Before the door of a noisome adobe hut two Indian women lay prone among a yardful of irritable hens.

From a distance the fields, blooming with ripening barley and with the brilliant reds and yellows of plants unfamiliar to us, were pleasant to the eye, but nearer approach shattered all illusion of cleanliness and comfort in the lime-washed farmhouses. Filth littered the inclosures, and a glimpse through the doorway of one of the windowless, unfurnished dwellings clouded the notion that they possessed any element of the picturesque.

It is not difficult to imagine the cheerless life of the village Indian from this inspection of his habitation. He is an integral part of the treeless uplands where dreary expanses of bare earth and cold blue sky inspire in him neither amiability nor aspiration. No wonder he is sullen, passive, submissive to his exploiting masters, the public functionaries, and the owners of land. He is undemonstrative, even in love; indeed, his language is as cold in terms of endearment as the winds that blow down hailstones upon him from the white peak of Sorata.

Aside from the numerous festivals, when there is a large consumption of *chicha*, the corn-brewed whisky of the Andes, nothing ever happens in Yunguyo. There is no alarm of locomotives, no clatter of wheeled traffic. The leather-sandaled Indians, the donkeys, the oxen, stray dogs, chickens, pigs and an occasional plaintive-eyed llama, give the *plaza* more of the appearance of a barnyard than of a village square. The church and the modern store buildings are anachronistic because of the human background. Except for them, Yunguyo is like a cinematographic cut-back of several centuries. And although it has none of the gilded atmosphere breathed by Prescott over the land of the Incas, its Indian inhabitants, in common with most others in the *altiplano*, no doubt live much as their ancestors did under Huascar and Atahuallpa.

Neither the Spanish autocracy nor the Peruvian democracy seems to have done much for the native. Even the ultimate destruction that usually results from forcible contact of a primitive people with a superior race appears to be going on less effectively and more slowly than in North America. In numbers, manners and general outlook upon life, South America's Poor Lo has changed little since the sixteenth century. Indeed, if the tremendous reputation of Inca civilization is to be taken at the rosy valuation of Prescott and other historians, the condition of the Indian today is far less happy.

This is one of several entertaining stories by Mr. Michener on his travels in South America. A second will appear in an early issue.

His Work Has Been to Teach a State to Sing

Kansas' Folks' Hunger for Good Music Partially Appeased by Concerts Held in Small Places Under University Auspices

By FRANK M. CHASE

THE dean of the state university's school of fine arts, a singer, and his wife, a reader, were giving a concert at a little town in Kansas a few years ago. The concert took place in the wareroom over a hardware store. A temporary stage had been erected at one end, while the seats for the audience consisted of a few folding chairs and planks laid over nail kegs. Acetylene lamps provided the light. A piano, borrowed for the occasion, had been hoisted upon the stage.

Though the town was so small that the performers wondered whence their audience could possibly come, they were greeted by a body of country folk that completely filled the room. The walls were fringed with standing men and boys. There was not a sign of an aisle anywhere.

In the middle of the reader's principal selection, a baby halfway back in the room began to cry. For a few moments the mother tried to quiet it; then, as she herself could not get out, the baby was passed over heads until a man at the stairway received it and carried it from the building. This procedure, of course, diverted the attention of the audience, and the reader felt her effort had been in vain. After the program, however, she and her husband were asked to shake hands with the people as they went out, and toward the end a woman, plainly dressed but of refined manner, spoke to her.

"I wish to ask your pardon for the disturbance my baby caused this evening," she said hesitantly, "and to explain why I brought so small a child to your concert. My husband and I are easterners and have had good educations. Before coming here I was used to good lectures, good plays and good music. Five years ago my husband lost his health, and we gave up our home in the East to live an outdoor life here. Meanwhile I had not heard a single concert or lecture. But when I learned that you and your husband were to give a concert here this evening I made up my mind that I would hear it, no matter what happened. My baby is too young to leave so long, so I put it and two more children in the buggy and came on. We have driven 11 miles over muddy roads to be here tonight."

When, in 1915, Harold L. Butler became head of the fine arts school of the University of Kansas, the institution felt that steps should be taken to satisfy the people's hunger for good music. Among its specific recommendations was that community music be fostered. To this end Dean Butler was asked to promote choruses in several of the larger cities, the idea being that he would so interest a sufficient number of music-lovers in each place that they would give the needed direction to local musical activities. This plan was tried, but it failed, the choruses being abandoned after the second or third year.

"We have approached our task in the wrong way," he said to the university officials, when the matter was again under discussion. "Our appeal has been almost entirely to those already well versed in music, some of whom we have tried to make leaders of their communities. Instead we should arouse musical interest among the people generally, and let them develop their own leaders."

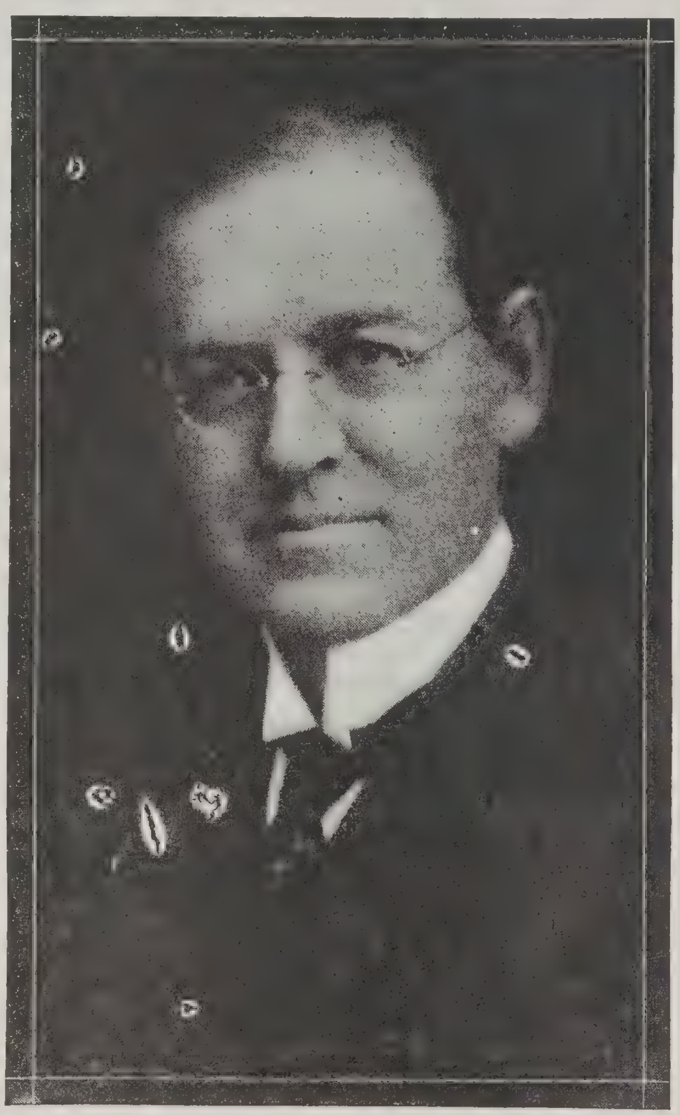
Realizing the failure of its own plan, the university willingly gave the dean opportunity to work out his ideas. Now for seven years before coming to Kansas Mr. and Mrs. Butler had given concerts in small towns, and knew the stimulating effect of such appearances upon a community's musical endeavors. He also knew, from a boyhood spent in an isolated district, what the occasional treat of good music means to people so situated. Accordingly, armed with a belief in the universal appeal of good music, they again set out in the business of concert-giving, but with a higher mission than merely to make some extra money. They were, figuratively speaking, to teach a state to sing.

At first they appeared mainly in the larger cities, one of Dean Butler's aims being to advertise the school of fine arts and that as quickly as possible. Then occurred the incident of the music-hungry farm woman. He saw the tears in her eyes as she asked pardon for her baby's interruption. He also noticed the catch in his wife's voice as she graciously forgave her. "If good music means as much as that to these farm people," he said to Mrs. Butler, "we must give more concerts in the little places."

In pursuance of this policy they have since given the bulk of their concerts in the small centers, and have made a special effort to fill every possible request from them. Before the opening of the present school year they had given 278 concerts throughout Kansas.

For the first two or three years Dean Butler himself handled all the applications for concerts. Recognizing their place, however, the university's extension division took over this work, and now attends to the details of arranging the dates. A flat rate of $55 is charged for each concert. This amount is based upon actual costs, and comprises the traveling expenses of three persons and the fees of Mrs. Butler and a pianist. Occasionally special programs requiring much extra preparation and the use of additional artists are supplied, in which case the charge is correspondingly higher.

Dean Butler has also set the phonograph to work at furthering his more-good-music program. Thirteen sets of records have been arranged, which are available to any organization or school that has or can borrow a phonograph. Each of these sets contains 15 records, which are selected with a special view to their educational and interest-stimulating values. A series of four sets, for example, illustrates the development of music, tracing its growth from the primitive and barbaric forms to the perfection of the opera, oratorio and orchestra. Other sets are devoted to American folk and war songs, to modern American music and to the patriotic songs and hymns of the Allied Nations; the latter having had an overwhelming demand during and just following the war. Another set, while consisting of excellent music, is primarily for entertainment purposes, having been collected particularly for such gatherings as parent-teachers' meetings.



HAROLD L. BUTLER,

Dean, School of Fine Arts, University of Kansas.

In his recitals Mr. Butler introduces each selection with a few remarks about the nature of the music, its setting or composer. This heightens interest in the music, and makes it more understandable. Consequently it is more enjoyable. The same result is obtained when the records are used by inclosing with each set a typewritten "talk" explaining the music about to be heard. In this way a liberal amount of instruction is given along with good entertainment.

The only charge for the use of the records is 50 cents a set to each borrower, this amount being necessary to replace broken and worn numbers. The borrower also pays the cost of transportation to and from the university, unless the records are on a circuit, when he pays the express charges one way only. Each set may be kept at one town for five days, during which as many organizations as possible are privileged and encouraged to use them. Advantage of this offer is often taken. In one instance a Sunday school, all the grades, the high school and several clubs made use of the same set during the week. The various sets have been sent to as many as 800 different places in a year.

Excellent results have followed Dean Butler's efforts. Though numerous agencies have been working to the same end, making definite statistics impossible, the last few years have witnessed a notable growth of musical interest in Kansas. This has been reflected in an increased attendance of concerts and recitals, and in the formation of many community choral and other music organizations. The increase in school orchestras has been particularly noticeable. There has also been a significant increase in the enrollment of music students in the university and other colleges of the state.

Doubtless Dean Butler's own appreciation of the desire of the Kansas people for good music has had much to do with his success. Born in an Idaho mining town 48 years ago, he did not hear a professional musician or troupe until he was 12 years old. If the people of the town had anything in the way of dramatics or music it was, with rare exceptions, indeed, strictly the product of home talent. His mother, however, while without any musical education, possessed a beautiful soprano voice and sang much to her children. Among his happiest memories is that of lying on the floor with his brothers and sisters, their heads on the large family dog, while listening to her dearly loved songs.

Inheriting his mother's ability, he early showed musical tendencies. At nine he was packing the front end of a bass drum in the school band, also playing a variety of mouth organs and ocarinas for his own amusement. Before he was through high school he had learned to play all the brass instruments. This achievement was to stand him in good stead, for by teaching those instruments and directing the college band he earned his way through Valparaiso University, graduating in both law and music. Finally centering his efforts on the study of voice, he continued his training in Chicago several years. Meanwhile he taught voice at Valparaiso, and later spent two years with a New York opera company. Returning to Valparaiso, he directed its school of music four years. He then spent 11 years as head of the vocal department of Syracuse University, from which he came to his present position.

While an able musician, there is about Dean Butler none of the affectation commonly associated with the "artistic temperament." From his efficient directness in recital or in leading the singing of a university convocation he might be taken as a high-powered business executive. Indeed he is not ill at ease in such company, taking an active part in Rotary and Chamber of Commerce activities. He is also of a practical opinion, even as regards music. He does not believe, for example, that every human can or ought to try to sing; nor does he believe that the right to perform belongs only to the elect.

"Community music is just now reaching its proper level," he said as the conversation neared his favorite subject. "During and immediately following the war it was over-stimulated. In an effort to interest everybody the appeal of the music used was too low. There was too much jazz. While I like to see community musical organizations I realize that not everybody can participate in them. The others, however, can be taught to appreciate good music, and to do so should be among the aims of community music."

"What kind of music do the people of the country and small towns like?" I asked.

"I have found that they like nearly every kind of music, as long as it is good music," he replied. "Though there is not much difference, the likes of the small towns are somewhat higher than those of the cities. This is because of the greater hunger for good music in the smaller places. 'Give us the very best music that you have,' is the request that I often have from the rural communities. And those people know good music when they hear it. For this the phonograph is largely responsible. It has helped wonderfully in promoting musical appreciation everywhere.

"By giving thought to the musical education of their children in one particular, parents may help the cause of community music considerably, and at the same time increase the entire family's enjoyment of the art. Instead of all learning to play the piano, as is the usual case, each child should learn a different instrument. Ordinarily not more than one can play the piano at a time but if, for example, the second child plays the 'cello, the third the violin, and the fourth the clarinet, they may all perform together with pleasure both for themselves and others. Such group playing tends to knit family ties more closely, while by each knowing a different instrument their value to a community's music is measurably increased."

That the motion pictures are holding back a more rapid growth in community music and dramatics is Dean Butler's opinion. "The movies have taken away much of the joy of participation in play," he said. "Our entertainment now comes ready-made. It is for us, but not by us. It is not our own. A more general participation in music would add greatly to the satisfaction of our lives."

The Jewish Smoke-screen of Falsehood in What Press Dubs the "Dreyfus Case"

Another Chapter of the Revelations Being Made in the Cronkhite Tragedy Brings Mr. Marshall of the Kehillah to the Fore

By CHARLES ALBERT COLLMAN

MORE than 70 witnesses were summoned, last autumn, before a Federal Grand Jury in Tacoma, Washington. They were assembled from widely separated parts of the country. On the strength of their testimony, the jury returned indictments charging Robert Rosenbluth and Rolland R. Pothier with the premeditated murder of Major Alexander P. Cronkhite. In certain quarters great fear is entertained of this testimony, and an organized effort is made to prevent the indicted men from being tried. *But justice demands that these witnesses be heard.*

Immediately on the news of the indictment, officers and directing heads of the American Jewish Committee and the New York Kehillah threw the mantle of their protection about Robert Rosenbluth in New York City. They provided him with lawyers to fight his extradition to the West, and with means for spreading an extensive publicity campaign, in an endeavor to prove his innocence without permitting resort to be had to the law courts of the country.

An avalanche of defamation was directed against the organization of the United States Army. A concerted system of attack was launched against the individual heads and personnel of the prosecuting arm of the government. An "atmosphere of persecution" was carefully built up, and in their vernacular press, a studied attempt was made to inflame the race hatred of thousands of immigrants with untruthful stories that the country which is giving them shelter was "framing up" a murder charge against one of their people.

How Press Is Used

SHOULD the plans of these great racial organizations prove successful, a deathblow will have been struck at the administration of justice in the United States. For a better understanding of these plans, it is necessary to recapitulate the outstanding features of the case.

Major Alexander P. Cronkhite was a West Point graduate, and only 24 years old at the time when he was shot. He was a lineal descendant from ancestors who first settled the Mohawk Valley in Colonial times, and was the grandson of Colonel Henry McLean Cronkhite, U. S. A., and Major-General Alexander C. M. Pennington, who was active in operations of the Army of the Potomac during the Civil War. At the time of his death, his father, Major-General Adelbert Cronkhite, was in command of a division in the Meuse-Argonne offensive.

On a Friday morning in October, 1918, Major Cronkhite led a battalion on a hike across the grounds of the army reservation at Camp Lewis, state of Washington. Captain Rosenbluth was the senior line officer in command. He was then about 40 years old, and such military training as he possessed, he had obtained at the Plattsburg training camp, New York. The major was senior instructor, and his principal work was the weeding out of officers who, as a result of examinations, were found not qualified to hold commissions for over-sea service.

When luncheon time arrived, the battalion was halted. The major went up a lonely trail to reconnoiter the ground. He was followed by Captain Rosenbluth and Sergeant Bugler Pothier. The three were hidden from the sight of the men, some 50 yards in advance of the column, behind a dense screen of shrubbery. Three shots rang out. Ten minutes later the major was found lying dead between his two companions.

Rosenbluth and Pothier, the only witnesses to the major's death, swore before a military board of inquiry that he had shot himself accidentally while firing at a tin can on a gatepost in front of the abandoned Schuffert farm. His death had been caused by a .45 caliber revolver bullet. But the men of the battalion refused to believe that the young West Point officer—whose colonel had given him the highest rating in the regiment—could possibly have shot himself. Their suspicions, they felt, were subsequently verified, when an autopsy performed on the body indicated that the fatal wound could not have been self-inflicted. But the major's uniform had been burned mysteriously, thus destroying the evidence of powder marks and the course of the bullet.

More than two years later, Pothier confessed that his testimony before the military board of inquiry had been a lie, and that it was a bullet from his weapon that had killed the major. He had made this confession to Father Liberté, the priest of his church, in Central Falls, Rhode Island. But Rosenbluth had sworn that he had been standing close beside the major when the second and third shots were fired. Since the third shot had killed the young officer, it was held that Rosenbluth's testimony was also under suspicion. The two witnesses were thereupon arrested, charged with responsibility for Major Cronkhite's death.

At once, on the arrest of Rosenbluth, his friends circulated a story that the young major had committed suicide because his father had proved himself a traitor to his country in the Meuse-Argonne offensive. But it was just at this time that General Cronkhite had had bestowed upon him the Distinguished Service Medal and the Cross of Knight Commander of St. Michael and St. George, and was promoted to the rank of major-general.

The group that was shielding Rosenbluth now decided that it was urgently necessary for them to try to cast discredit upon the confession made by Pothier. They enlisted the services of a newspaper owned by members of their race, the New York *World*. The editor of the *World* first sent a reporter to consult Robert Rosenbluth and his attorney, Jonah J. Goldstein, in New York City. The reporter then saw Pothier in Central Falls, Rhode Island, but the latter would not speak until he had seen his attorney, Davis G. Arnold, of Providence. Mr. Arnold refused to have his client interviewed until he had visited New York. Subsequently the *World* man talked to Pothier in Mr. Arnold's office in Providence. The *World* then published an alleged retraction of Pothier's confession implicating Rosenbluth, but not retracting the statement that it was the bullet from his weapon that had killed Major Cronkhite. Publicity organizations, acting on behalf of Rosenbluth, gave this "retraction" a wide circulation.

Now Goldstein & Goldstein, attorneys for Rosenbluth, drew up a series of affidavits, consisting of some made by themselves, others by Pothier's lawyer, by the *World* man, and by other persons who knew nothing about the case. These they sent to J. W. Selden, a prosecuting attorney of Pierce County, Washington. Next a booklet of 62 pages was printed by an East Side press, entitled the "Exoneration of Robert Rosenbluth." This was a "faked" exoneration, since Mr. Selden had not been in possession of the evidence in the hands of the Department of Justice, had not examined the witness nor tried the case. This booklet was circulated by thousands of newspapers of the country at a great expense. In other words, a man charged with murder, was "acquitted" by his friends, without recourse to law court, judge or jury, and without his accusers being heard.

Some months later, the 70 or more witnesses appeared before the Federal Grand Jury in Tacoma, and Pothier and Rosenbluth were indicted for the murder of Major Cronkhite. But before this, incendiary hands set fire to the gateposts, fences and buildings on the Schuffert farm, evidently because a jury, in visiting the place of the shooting, would have realized that army men would not have resorted to the place for target practice.

Newspaper Tries Case

ROSENBLUTH, while yet untried, is presumed to be innocent. But it is an unusual spectacle to observe a man indicted for murder, and refusing to plead to the indictment, being abetted and encouraged by men of wealth and prominence, attacking the United States Army, and threatening the chief prosecuting officers of the government. To this end a long-continued campaign has been conducted in the columns of the *Daily News*, which has an immense circulation on New York's East Side. These attacks, fathered by Rosenbluth, are intended deliberately to foment the rage and hatred of an emotional population against the country of their adoption. Examples are herewith presented:

> From the *Daily News*, April 18, 1921:
>
> Evidences that the investigation which is being put under way in the case of Captain Rosenbluth will develop into an American repetition of the famous Dreyfus case showed plainly yesterday in three separate directions.
>
> "Is it true that there exists in the Army an antipathy to Jews that has made the former captain a mark in his present situation?"
>
> Many of Rosenbluth's supporters insist that it is. And they intimate that an investigation, once under way, will take on nation-wide importance and extend to every corner of the Army organization.
>
> "Pothier is either a crazy liar or the willing tool of a rotten and decadent system," said Rosenbluth yesterday when he came back from Washington and made an exclusive statement to the *Daily News*.
>
> It was in the summer of 1918 when Cronkhite was killed. *The death was called suicide until the return of General Cronkhite,* father to the major, from France. Then the body was exhumed and examined, and the charge of murder made.
>
> Rosenbluth was direct in his charge yesterday that the prosecution against him came from "The System."
>
> "Pothier," he repeated, "is either a crazy liar or *the willing tool of the dying war-time system responsible for the so-called round robin and its contingent suicides."*

> *Daily News*, October 21, 1922:
>
> Captain Rosenbluth yesterday was released on $40,000 bail furnished by Felix Warburg, Colonel Herbert Lehman and others. Captain Rosenbluth has been called the "American Dreyfus."

From article bearing the signature of Robert Rosenbluth:

> There are two very good reasons why this persecution against me on this four-year-old incident is renewed by Attorney-General Daugherty:
>
> 1. Because if the matter is in the courts while the impeachment proceedings against him are pending, Congress will not be able to take up this case with its evidence of incompetence and misfeasance in office by Attorney-General Daugherty personally and his department.
>
> 2. *Because I have refused to respond to the many suggestions that my "rich Jewish friends raise a fund to dispose of the matter."*
>
> In spite of rebuffs of suggestions that settlement could be effected if my "rich Jewish friends would raise a fund," 10 weeks before this present grand jury met in Tacoma, Washington, from sources whose authority cannot be questioned, came the direct proposition that "everybody could be happy."
>
> It was warranted "that this would be cheaper than a trial." I still believe that it is a good American motto: "Millions for defense, but not one cent for tribute."
>
> Agents of the Department of Justice taunted, "What are you going to do about it?" As soon as they discovered that they had made a mistake and had taken some one with a lifetime record in public service and that my bail was furnished by persons as well known and highly respected in the country as Felix M. Warburg and Colonel Herbert Lehmann, *they started on a new track. Cash!*

What Happened Before Jury

OF COURSE, nobody takes seriously the allegation that Rosenbluth is being "persecuted because of his race." The fact that the United States Army is a "rotten and decadent system" was never suspected until it was asserted by Rosenbluth's friends. But it will be recalled that when Rosenbluth was first arrested on April 21, 1921, he openly proclaimed: "I wish to reiterate my absolute confidence in Attorney-General Daugherty."

It was only when he was indicted by a Federal Grand Jury, that he and his friends aimed all their attacks upon the Attorney-General, and Samuel Untermyer threatened to impeach the latter.

With regard to the impudent charge that the Attorney-General of the United States and the Department of Justice had attempted to blackmail Rosenbluth and his "rich Jewish friends," it may be well to relate a detail that was not published in the *Daily News*. Colonel Hayward, United States Attorney for the Southern District of New York, promptly summoned Jonah J. Goldstein, Rosenbluth and a writer for the *Daily News* before a Federal Grand Jury in New York City, to make good their charges.

In speaking to a high Federal official regarding the result of this inquiry, he said to me: "Of course, I am not privileged to divulge secrets of the grand jury room. But I can tell you this. When Jonah J. Goldstein testified before the grand jury, he made a fool of himself."

I can enlighten the reader to this extent: When Goldstein and his associates appeared before the grand jurors, **they made a characteristic and abject "crawl."** They protested fervently that they had never intended to cast any reflections upon the Attorney-General or the Department of Justice. Their words had been misinterpreted. What they had intended to insinuate, they said, was that a fund was going to be raised to engage counsel for the defense of Rosenbluth. **But they had accomplished their purpose. They had implanted in the minds of thousands of their race that the United States Government is so corrupt that its highest officials are ready to "frame-up" their people, and then blackmail them.**

It is quite unnecessary to dwell further upon the widespread ramifications of the "Rosenbluth publicity," beyond calling attention to articles in periodicals such as *The Nation* and *The Literary Digest,"* provided by an accused man, and printed without any attempt to obtain the real facts. When a Federal investigation is made into the sources of this propaganda, the country will be amazed by the tactics of a special group in creating "racial sentiment."

Space must be given, however, to an organization known as the "Institute for Public Service," which professes to "circulate facts, questions and suggestions of nation-wide importance about public service by governments, civic agencies, higher education and benevolent foundations." It issues its matter weekly from No. 1125 Amsterdam avenue, New York City. Robert Rosenbluth has admitted that in 1917, he was an "assistant director" of the Public Service Institute.

This "Institute," in March, 1919, published a 32-page pamphlet entitled "Teachable Facts About Bolshevism and Sovietism," which is apparently but a thinly disguised propaganda. It states in part:

> *The Nation* and the *New Republic,* New York City, have printed many articles and editorials which pictured Bolshevist theory and practice as

(*Concluded on page 14*)

Where Iron Mines Are Building Public Schools

Permanent Fund in Minnesota From Ore Tax Reaches $35,000,000

By EARL CHRISTMAS

WHEN a representative of the proposed territory of Minnesota sought authority from Congress for its organization back in 1849, he asked for a generous grant of land for schools.

"All right," said members of Congress to whom the request was presented. "If people will live up in that forsaken, hyperborean country, they ought to be encouraged. We will give them two sections of school land instead of one."

So the story goes. Anyway, two sections of land in each township in Minnesota were reserved for school purposes. Previously, it had been customary to set aside but one section of school land in a township for each state, though Oregon, organized as a territory about the same time, had managed to obtain a reservation of two sections.

For that extra section of land, some 500,000 school children of Minnesota have reason to be thankful today. It means more money for schools. But Congress doesn't get all the thanks.

Nature was kind to these children. Over much of this land set aside for school purposes, it spread forests of valuable timber. Beneath the surface, it placed great deposits of iron.

Of course, nobody knew about the iron back in the days when Congress so blithely gave away those two sections. Not until long after was the value of the land for this purpose realized. The mineral rights to the land were not reserved by the Federal government.

For all this, the school children now can be thankful. Minnesota has a permanent school fund of approximately $35,000,000, developed from the sale of these lands, the sale of timber and royalties from iron mines located on the school lands.

Each year the fund gets bigger, increasing annually at the rate of about $1,500,000. Every time an ore train goes down to the docks at Duluth from one of these mines, it means more money for the schools of the state. Each tree cut down on the school lands adds to its total.

From the Missabe Mountain mine alone, the schools now are drawing $1,000 a day. During the season from June 1 to November 1, the average income is $5,000 a day, which isn't a bad return from 160 acres of land. Already this one mine has added more than $2,000,000 to the school fund, and it has some 50,000,000 tons of ore yet to be mined. The Leonidas mine has contributed more than $1,000,000 to the schools, and it contains more than 13,000,000 tons of ore yet to be removed.

Engineers for the state estimate that there is enough merchantable ore on school lands to more than double the permanent school fund. That will mean at least $70,000,000, which must be kept inviolate for the benefit of the school children of the state. Some officials have put the prospective total as high as $100,000,000 or even $150,000,000.

Fine, you say. But don't imagine that all this has come about simply as an act of fate. Nature put the iron under the school lands and the trees on the surface, but it has required jealous guarding by the state to preserve these resources for the schools. But for the efforts of a few farsighted men among those early pioneers, the children of Minnesota today might not have prospects of that fund of $70,000,000.

In many states, the land grants for schools virtually were thrown away. Speculators reaped the profits that should have gone to the schools, and the cause of education has suffered. An early superintendent of schools in Ohio wrote: "It is not uncommon to find land sold for 50, 40, 30, 10 and in one case as low as 5 cents an acre."

Men also had designs upon the public lands of Minnesota. But Governor Ramsey, turning his back on the speculators and forgetting the emergencies of the new state that called for funds, urged that the school lands must be administered with a view to the permanent interest of the schools. He warned against the experience of Iowa and Wisconsin, where the land was given a minimum appraisal of $1.25 an acre and the splendid grants allowed to become the prey of speculators.

The new state provided for an appraisal of its school lands and set a minimum of $5 an acre. In fact, it first tried a minimum of $7. The lands could be sold off only gradually, the best farm lands being disposed of first. In every year, the average price received has been above the minimum, usually running from $6 to $8 an acre.

Other officials after Ramsey's time encountered men with designs on the public lands of Minnesota. Governor Austin, despite the greatest pressure, vetoed a bill to turn over to the railroads 500,000 acres of state lands from the internal improvement grant.

Only recently, there came to light, on good authority, an experience of one of these early governors. This governor was approached one day by a stranger who after due preliminaries suggested that a company might be formed to take over the state lands at a comparatively small price.

The legislature could be pursuaded to approve the plan, the stranger intimated. In fact, something already had been done along that line, he added.

The governor appeared to be deeply interested. The stranger became bolder. He suggested that this corporation would need a general counsel, that the governor had been a good lawyer, that New York would be a nice place to live.

The governor jumped up and pounded the table.

"Now, I've got it all," he said. "I know every man involved in this affair. I've got the inside of it. If it goes one step further, every one of you will go to the penitentiary."

The matter was dropped. Bills which had been prepared never were presented to the legislature. The governor who thwarted the attempt was content with defeating it and never made it public. Only after his death was it repeated by a friend to whom he had confided the experience.

When prospects of valuable iron mines developed in the eighties, Minnesota decided not to sell its ore lands, but to lease them. Even when lands were sold for other purposes, mineral rights were reserved. As a result, there are now approximately 40 iron mines on state property, about two-thirds of them on the common school lands.

Of course, Minnesota has some things to regret. The flat royalty of 25 cents a ton, fair enough when established, later proved inadequate and has been the means of losing thousands of dollars yearly to the school fund. This law since has been repealed and a new arrangement made, providing for a sliding scale. Complaints have been made, too, and with justification, that timber has been sold from school lands too cheaply and in some cases stolen.

But on the whole, Minnesota has fared better than most states with its school fund. It has $35,000,000 in the fund, and in another generation will have twice that much, while many states have allowed this resource to slip away entirely.

But the most interesting possibility appears when we consider how that fund of $35,000,000 is being used. The principal forever must be kept intact. The early lawmakers saw to that. Only the interest can be used.

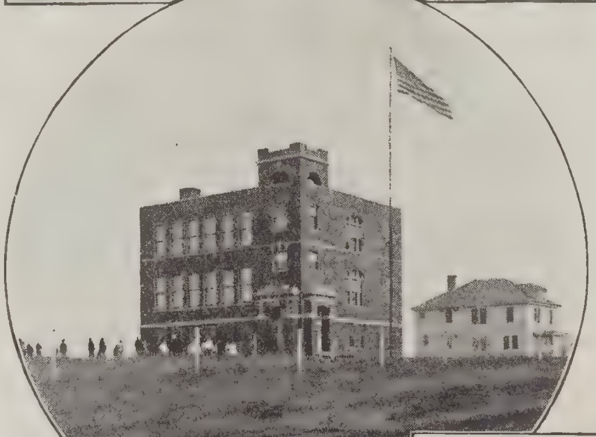
That means about $1,400,000 distributed each year to the schools of the state. With the proceeds of a one-mill tax, provided by the constitution of the state, this apportionment annually brings $7 a pupil to the schools. Often schools could not be maintained in thinly settled communities but for this fund.

All of which is very fine. Ore from the iron mines owned by the schools is helping to bring the light of education into little clearings far up in the woods. But Minnesota is using that fund twice for the benefit of the schools. While preserving and safeguarding it, the state has found a way to make

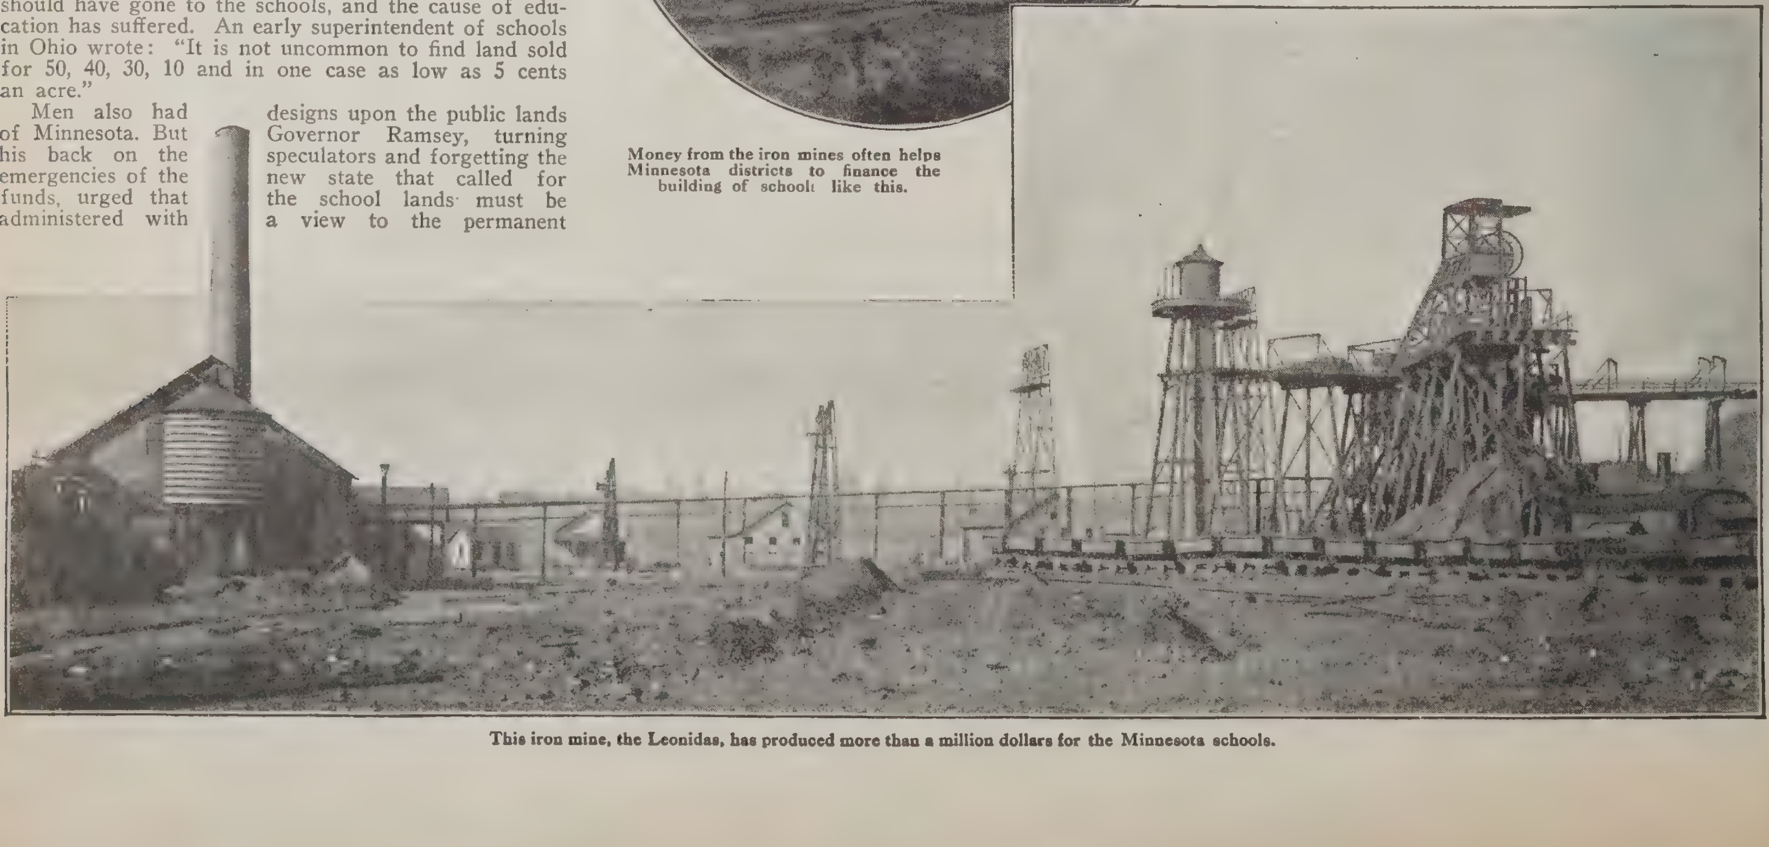
(*Concluded on page 14*)

Ore royalties and other receipts from the school lands have helped to keep open many a little school in Minnesota.

Minnesota pays $700,000 a year for the transportation of some 25,000 children who live long distances from schools. Most of these children are taken to consolidated schools where they get training equal to that of city children.



Money from the iron mines often helps Minnesota districts to finance the building of schools like this.



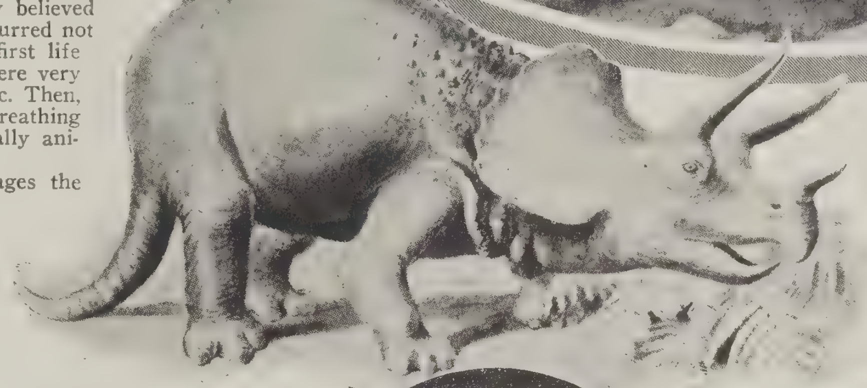
This iron mine, the Leonidas, has produced more than a million dollars for the Minnesota schools.

The Interesting Life of a Fossil Hunter

Career of Charles H. Sternberg—the Story of a Man Who Has Delved in Records of Long Ago

By D. M. LE BOURDAIS

Hauling fossils and boxes uphill from fossil beds, Red Deer Valley. This gives some idea of the nature of the "Bad Lands" of the Red Deer Valley.



Triceratops Prorsus, one the later forms of dinosaurs.

FROM a very early time in his history man has sought to read the riddle of his first appearance on earth and to learn something of the life which preceded him; but it is only comparatively recently that he has succeeded even slightly in deciphering the record hidden within the crust of the earth.

Scientists differ, but it is generally believed that the dawn of life on this planet occurred not less than 30,000,000 years ago. The first life forms of which there is any record were very primitive and were probably all aquatic. Then, gradually through the ages, air-breathing forms of life developed; and eventually animal life appeared on the land.

During the successive geological ages the face of the earth has undergone many changes; land which at one time formed huge continental masses at a later period became the bottom of the ocean. This process was repeated over and over again, some portions of the earth's surface, however, being subjected to a greater number of changes than others.

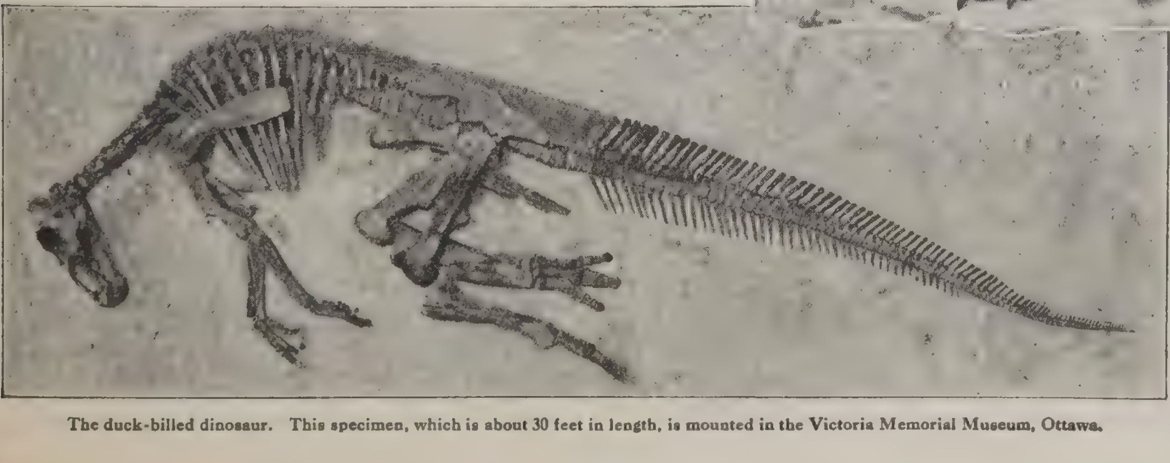
These changes were due to two principal causes: subterranean pressure; and the erosive action of water ceaselessly wearing away the land and carrying it out to sea.

While certain areas were submerged the remains of animal life that had died in or near the water found a resting place in the ooze or sand on the bottom and in the course of time became buried deep beneath many layers of deposit brought down by streams, or eroded by the action of the tides; and when this ocean bed eventually became dry land the former ooze, sand or clay became sandstone or shales, the remains of animal or plant life which were embedded in it being likewise converted into stone. In this manner the form of trees, leaves, fruit, shells and animal life from the minutest insects to the largest dinosaurs have been preserved to this day. These remains are known as fossils. And by them geologists seek to reconstruct in a measure the conditions of life which prevailed in ages long gone by.

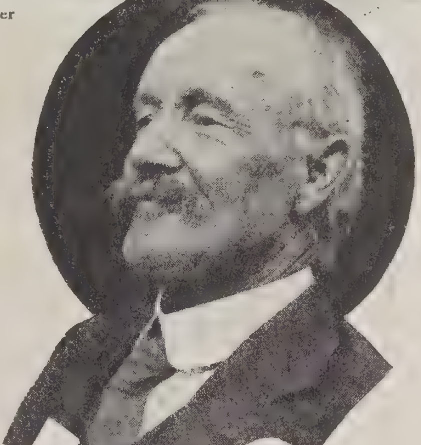
In some portions of the globe the earlier formations lie deep below the present surface. Later formations have been piled upon them and have been subjected to comparatively little erosion. In others, large areas of the older formations are exposed, or lie very close to the present surface. This happens to be the case in many sections of the vast central plateau and mountain region of North America. The greater part of this area during the Cretaceous period was covered with water. This was before the Rocky Mountains were formed; and the land lay in low irregular ridges between extensive shallow lagoons, lakes, bayous and swamps. The climate was sub-tropical; the vegetation was dense. This was the age of the dinosaurs.

After being repeatedly lifted and submerged these everglades of the Cretaceous period were finally elevated to their present level and the Rocky Mountain chain was thrust up to feed great rivers whose valleys have cut through the old beds lying so near the present surface. These channels provide opportunities for the student to examine the various underlying strata; and they also expose the fossils which the rocks contain.

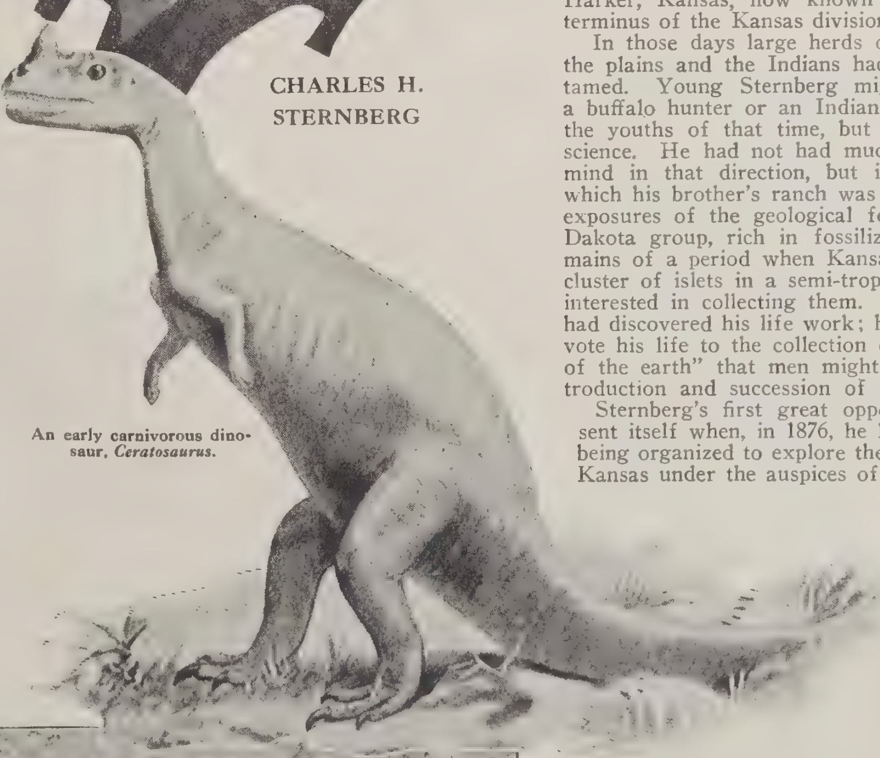
For this reason North America presents an extensive and varied field for the student of geology. The particular branch of that science which deals with the study of fossils is called paleontology; it has become an increasingly important branch of human knowledge within recent years. And paleontology has given rise to another profession: that of the fossil hunter, the oldest and most distinguished of whom is the subject of this sketch—Charles H. Sternberg, of Lawrence, Kansas.



The duck-billed dinosaur. This specimen, which is about 30 feet in length, is mounted in the Victoria Memorial Museum, Ottawa.



CHARLES H. STERNBERG



An early carnivorous dinosaur, *Ceratosaurus*.

Plains of West Furnish Splendid Specimens of Monsters of Another Era

Born in Otsego County, New York, in 1850, the son of a Lutheran divine, who for many years was principal of Hartwick Seminary, Charles Sternberg early learned to love the study of nature among scenes made famous by that other great native of Otsego County, James Fenimore Cooper.

When Charles was 15 years of age the elder Sternberg was appointed to the principalship of the Iowa Lutheran College at Albion, Iowa; and the familiar countryside of his boyhood gave place to the plains of the Middle West. Two years later Charles and his twin brother (later to become famous as chief of the United States Army Medical Service), went to live with another brother who was ranching near Fort Harker, Kansas, now known as Kanopolis, then the terminus of the Kansas division of the Union Pacific.

In those days large herds of buffaloes still roamed the plains and the Indians had by no means yet been tamed. Young Sternberg might easily have become a buffalo hunter or an Indian fighter as did many of the youths of that time, but his ambitions turned to science. He had not had much chance to indulge his mind in that direction, but in Ellsworth County—in which his brother's ranch was situated—were extensive exposures of the geological formations known as the Dakota group, rich in fossilized leaves and other remains of a period when Kansas supposedly was but a cluster of islets in a semi-tropical sea; and he became interested in collecting them. Within a short time he had discovered his life work; he was determined to devote his life to the collection of "facts from the crust of the earth" that men might learn more of "the introduction and succession of life on our earth."

Sternberg's first great opportunity seemed to present itself when, in 1876, he learned that a party was being organized to explore the chalk fields of Western Kansas under the auspices of Professor O. C. Marsh, the famous paleontologist of Yale University; but although he tried hard to obtain a place on the expedition he was not successful. Then, almost in despair, he wrote to Professor E. D. Cope, of Philadelphia, who even at that time had won more than a local reputation in paleontology. "I put my whole soul into the letter I wrote him, for this was my last chance," Sternberg writes many years later. "I told him of my love for science, and of my earnest longing to enter the chalk of Western Kansas and make a collection of its wonderful fossils, no matter what it might cost me in discomfort and danger. I said, however, that I was too poor to go at my own expense, and asked him to send me $300 to buy a team of ponies, a wagon, and a camp outfit and to hire a cook and a driver. I sent no recommendations from well-known men as to my honesty or executive ability, mentioning only my work in the Dakota group."

Professor Cope was impressed with the young man's enthusiasm and replied immediately enclosing a draft for the sum requested. Sternberg thus entered the

The Labor Party in the House of Commons

Will the Scottish "Wild Men" Be Controlled by the "Intellectuals"?

By W. P. CROZIER

A CORRESPONDENT IN ENGLAND

THE shining characteristic of the new House of Commons is not the Conservative majority under Mr. Bonar Law, for that was not wholly unexpected, nor the battalion of Liberals under Mr. Asquith, nor even in itself the doubled strength of the Labor party, now nearly 150 strong. Not the number but the character of the men on the Labor benches excites interest and speculation. At the election of 1918 the Labor M.P's went up in number from about 30 to 70. We quickly learned the best and the worst of them. They were good constitutionalists, moderate men, sober, honest and deserving of all respect. But they lacked force and driving power, and they made little or no impression on the machine of government. The same men are back in Parliament now, but there are others with them of a very different order.

When Mr. Robert Smillie, the Scottish miners' leader, was bidding goodby the other day to the new Labor M. P's whom Glasgow has elected, he bade them "put ginger" into the Labor party at Westminster. When one of these new members was watching the ancient ceremonial in the House of Lords, he cried aloud, "We'll smash all that," and another, on seeing the formal handing of the speaker to the chair of the House of Commons, raised his voice in open derision at these symbols of long tradition. "Wigs on the green," "the claymore and the two-handed sword," "no namby-pamby methods," "the fresh air of Scotland for the House of Commons"—these and similar phrases betoken a new spirit in the new Labor party. This spirit will work and work, undoubtedly. How far will it leaven the whole lump? To answer that question, one must look more closely at this new Labor party of ours. For there are other leavens also at work, other forces fermenting in the lump.

But first to dispose of two notable individual results. The Labor ranks include Mr. Scrymgeour, of Dundee, the first prohibitionist to reach the House of Commons. Roughly he accepts the Labor program and it is understood that the Labor "machine" in Dundee desired that the second vote of the party (there being two members for the constituency) should go to him. But how far, it will be said, does the return of Mr. Scrymgeour, with a vote of 32,000 (12,000 above Winston Churchill) mean that England, or even Scotland, has made a large advance toward the acceptance of prohibition? In Scotland it means little, and in England nothing at all. Mr. Scrymgeour reaped the reward of his perseverance. He is a great local figure and they said, "give him a chance." Also, he received a very heavy Labor vote. But, generally speaking, prohibition not only makes little or no advance, but excites little interest. Of all the "issues" that figured in England during the election campaign, temperance—alas! that it should be so!—was least discussed. Public opinion is apathetic about it and the organized political parties are scandalously timid about the organized opposition of the liquor interests. Why, there were candidates who devoted a large part of their energies to arguing that, above all, beer must be made cheaper and to promising that, if elected, they would fight for that great cause!

The lonely prohibitionist has a lonely Communist to keep him company. He also comes from Scotland —Mr. Newbold of Motherwell. He is said to have wired to Lenin that "Motherwell has been won for Moscow." This does not mean that Scotland is "going Bolshevik." It only means that there is a considerable number of places in Scotland which would return any sort of a Labor man, including an extremist, sooner than a Liberal or a Tory. If all the Glasgow Labor M. P's had stood as downright Bolshevists, they would have been returned just the same, for there is intense unemployment on the Clyde, and unemployment accentuating a naturally aggressive temperament turns to the most extreme form of politics that is at the moment available. One may say truly that the Clyde comes nearer to Communism than any other part of these islands but, in spite of Motherwell, they are not yet Bolshevist.

The Clyde Socialists, of whom there is now more than a handful in the Parliamentary Labor party, have been recognized as extreme men since the early days of the war. Thus, one of them is David Kirkwood, a leader of the shop-stewards' movement, who, when Lloyd George as Minister for Munitions, was introducing the "dilution" of skilled trade union labor, met him on the floor of the Clyde workshop, along with the other shop-stewards, and defied him to his face. That episode resulted in the suppression of the Glasgow Socialist paper, *Forward*; today its editor, like his friend Kirkwood, has been returned to the House of Commons. There is a story that when the *Forward* was suppressed, its editor posted up to London to see Lloyd George about it. Lloyd George, it is said, addressed him with tears in his eyes on the subject of "the lads in the trenches" and the dour Scotsman told him that he had not come all the way from Glasgow to London to be "wept at" like that. There is no doubt that the Glasgow Labor M. P's will bring a very different brand of Socialism, a very different temperament, a grim challenging spirit, into the Labor party. But there are two other new elements that also have to be considered.

Labor has suffered severely from its lack of men with a large intellectual grasp. It has been composed, in the House of Commons, of small trade union leaders. It has inevitably had no "captains of industry" and it has had no "intellectuals"; that is, it has had no men who are accustomed to take a large view of economic and political questions or to handle affairs on a large scale. As far as there have been able thinkers in the Labor ranks they were outside the House of Commons. Now some of the best of them will be there to assist the party in its fight. Among them will be Mr. Sidney Webb, our leading authority on the history of trade union organization and municipal government, and prepared to be the architect of future Labor policy in every field. As long as he is in the House, Labor will never lack a program and a plausible defense. With him also will be Mr. Ramsay MacDonald and Mr. Philip Snowden, two of the keenest-witted of all our Socialists and two of the ablest debaters. Some people will not think the better of him for it, but it was of Ramsay MacDonald that Lenin said, "I can talk to MacDonald, for he at least is interested in theories" (in distinction, of course, to the trade union leader, who usually knows nothing and cares nothing about Socialist theory).

The third new group in the Labor ranks which counts consists of the former Radicals who went over to the Labor party during the last stages of the war. They left the Liberal party mainly because they were dissatisfied with its foreign policy and its attitude toward all questions of personal liberty; they saw in the Labor party the best instrument of a peaceful, unaggressive foreign policy and a program of generous social development at home. These also are "Intellectuals" and they are thoroughly well-equipped and experienced in the field of politics. They include men like Ponsonby, once a page at the Court of Queen Victoria, then in the service of the foreign office and finally private secretary to a Liberal premier. C. P. Trevelyan, Lees-Smith, and E. D. Morel, an extreme man but highly expert in foreign affairs, belong to this group. Its inclusion in the Labor party is enormously important, for there never was a time when foreign policy was so material to the well-being of this country and the ordinary trade union member, from no fault of his own, knows next to nothing of foreign affairs. The party will now have the advantage of a general staff in foreign policy which will be as expert and aggressive as that of the "middle-class" parties who have hitherto in this respect enjoyed a great advantage.

It will now be seen what I meant by saying that it was doubtful whether the loud-voiced extremists from Scotland would be able to leaven the whole lump of sober, conservative trade-unionism. The thinkers like Sidney Webb and Ramsay MacDonald, and the ex-Radicals like Ponsonby and Trevelyan will never allow the Kirkwoods and Newbolds to dictate the policy of the party if they can prevent it. Their aim will be to secure the loyal support of the moderate trade union M. P.'s, who form the great majority of the party, and to use it to control the wild men from the Clyde.

Mr. Clynes, the trade union leader, will help them all he can. Just as the problem of Mr. Bonar Law is to keep his wild men, his Tory Die-Hards, in order, so the problem of the moderate and intelligent Labor leaders is to harness the Scottish (and any other) extremists to the task of sober, reasoned opposition. They must do this in their own interest. For if the wild men succeeded in "collaring" the Labor party, if they so leavened the whole Labor party that it began to act in the spirit of "We'll smash all that," then there would soon come about a defensive fusion of the Liberal and Conservative forces both in Parliament and in the country which would put back the chances of Labor for a generation.

The Interesting Life of a Fossil Hunter

Concluded from page 11

service of one of the greatest, if not the greatest, naturalists that America has produced; and on and off until Cope's death 21 years later he searched the fossil beds of the West for specimens to add to that great collection which Cope was gathering at Philadelphia (now in the American Museum of Natural History, New York) and to assist that eminent scientist in his ambition to bring to the attention of the world the great importance of the science of paleontology in uncovering the secrets of Nature.

Naturally desirous of justifying the faith which Cope had shown in him, Sternberg was anxious to secure a collection of specimens worth while and set off for the chalk fields with his mind full of the unknown monsters whose bones he hoped to unearth for his patron. "All day," he writes, "from the first streak of light until the last level ray forced me to leave work, I toiled on, forgetting everything but the one great object of my life—to secure from the crumbling strata of this old ocean bed the fossil remains of the fauna of Cretaceous times."

The incessant labor and the bad water brought on an attack of malaria, but he kept on. Finally one day when his discouragement was greatest he discovered an excellent specimen of a Kansas mosasaur. It was a new species and pleased both Sternberg and Cope very much. The years following were spent in the Kansas fields, in the Bad Lands of Nebraska and in a portion of Southern Oregon previously but little known. In each field many valuable finds were made and great difficulties were overcome. The great distances which it was necessary to travel to reach the desired locations as well as the difficulties of transporting the crated specimens to the railway when found were by no means the least of the hardships attendant upon a fossil hunter's life, particularly in those days. And in addition there was almost always the possibility of attack by hostile Indians. Sternberg did not greatly fear the latter, but such was not the case with his teamsters, cooks and other assistants; and he was frequently put to much trouble and inconvenience through their desertion of him on that account while in the field.

Dr. Henry Fairfield Osborn, in his introduction to Sternberg's book, "The Life of a Fossil Hunter," gives a good idea of the nature of such a life: "The fossil hunter must first of all be a scientific enthusiast," he writes. "He must be willing to endure all kinds of hardships, to suffer cold in the early spring and the late autumn and early winter months, and he must be prepared to drink alkali water, and in some regions to fight off the attack of the mosquito and other pests. He must be something of an engineer to be able to handle large masses of stone and transport them over roadless wastes of desert to the nearest shipping point; he must have a delicate and skillful touch to preserve the least fragment of bone when fractured; he must be content with very plain living, because the profession is seldom, if ever, remunerative, and he is almost invariably underpaid; he must find his chief reward and stimulus in the sense of discovery and in the dispatching of specimens to museums which he has never seen for the benefit of a public which has little knowledge or appreciation of the self-sacrifice which the fossil hunter has made."

Among the museums to which Sternberg has supplied fossils from time to time are numbered most of the great institutions in Europe and the United States. The British Museum contains many rare specimens from his collections, as does the National Natural History Museum of France; while his collection of Kansas Chalk and Texas Permian vertebrates in the Museum of Munich has been described by Dr. Osborn as the finest of its kind in the world; and in this regard Dr. von Zittel is also quoted as having declared that Sternberg by this collection had erected an "immemorial monument" to his name.

At various times Sternberg also sold specimens to the Canadian Museum at Ottawa. Among these, in 1911, was the skeleton of a huge *Titanotherium*, one of the largest of prehistoric mammals. This he undertook to deliver completely mounted in the museum, and it was therefore necessary for him to go to Ottawa. In March, 1912, he arrived with his son George in the Canadian capital, and shortly after accepted an offer to enter the employ of the Canadian Geological Survey as head collector and preparator of vertebrate fossils. Later on his three sons, George, Charles and Levi, all of whom had in turn adopted the paternal profession, likewise joined the Canadian service. They were to be introduced to a new field—a fossil hunter's paradise.

The Red Deer River rises in the Rocky Mountains, not very far north of where the Canadian Pacific Railway passes westward on its way to the Pacific, and flows southeasterly across the province of Alberta. It has cut a broad, deep valley through the surrounding prairie, in places from one to two miles in width and from 400 to 500 feet in depth. For a great part of its distance this stream cuts through beds of the Cretaceous period in which lie the bones of the giant dinosaurs, as well as a variety of other fossils including full-length petrified trees.

While he had discovered dinosaurs in Kansas and Nebraska, Sternberg had never before been in a field so rich with remains of these giant reptiles as he found the Red Deer Valley to be. And otherwise everything was such as the heart of a fossil hunter could desire: a pleasant country in which to work; boats and scows on the river for transportation purposes; and his three fine sons, expert and eager to carry on and extend the work which he had taken up almost half a century before. In hunting fossils in the Red Deer Valley the method is somewhat similar to that employed by prospectors when looking for quartz or ore. The hunter usually follows the course of the stream along the base of the cliffs and looks for "float"—in the case of fossil hunters, a bit of fossilized bone. When this is found the face of the cliffs is searched for the spot whence the fragments came. Then when the remainder of the skeleton is located—if, indeed, it is located—several days, and frequently weeks, of hard labor is required to cut away the solid rock. When the fossils are at length exposed great care must be exercised as a careless blow from a pick might shatter a skeleton and require days of patient effort fitting the fragments together again.

One of the most formidable of the carnivorous dinosaurs has been named by Lambe, *Gorgosaurus*. The specimen which Sternberg collected for the museum at Ottawa is about 30 feet in length and apparently stood about nine feet high at the hips. Its method of locomotion was probably similar to that of the modern kangaroo as its hind legs were very long and strongly built, while the forelegs were quite short and apparently of little use in walking.

A great quantity of fossils is being taken each year from the Red Deer fields and shipped to museums the world over, much of which has gone to the American Museum of Natural History in New York, whose associate vertebrate paleontologist, Dr. Barnum Brown, has been very successful in bringing to light many of the great dinosaurs, some new to science.

Archery Supplanting Golf as Winter Sport

Archery lessons are given at Hialeah by "Charley Billy," a Seminole Indian. At the left is shown a class taking instruction. Above is Helen Holmes, motion-picture actress, receiving a lesson from Charley.

THE world's oldest sport is becoming a feature of the winter life at America's newest town. And the novices are being taught by America s oldest race—the Indians.

Hialeah, the two-year-old town founded by Glenn Curtiss, aviator and airplane inventor, seven miles north of Miami, Florida, has adopted archery as a competitor of golf.

Out on the Everglade prairie, near Hialeah, archery is daily recreation of winter tourists and motion-picture actors. The sport is being taken seriously as a recreation, Curtiss having pointed out that as long ago as 1760 archery was taken up in America as a builder of the body and the eyesight.

Picturesqueness is added to the sport by the fact that a camp of Seminole Indians is situated near Hialeah and the Indians of all ages take delight in instructing the whites in the correct use of the bow and arrow.

A round of archery consists of 96 arrows at 60 yards for men or 96 arrows at 50 yards for women. The target is four feet in diameter.

What Every Police Reporter Knows—and Doesn't Write

Tragedies of the City That Come Because of Influx of Aliens

By LEWIS HARPER

RECENT articles on the three per cent immigration law in some financial journals have voiced a distinct regret that in the restricted quotas of immigrants now admitted there are much larger proportions of women than formerly.

From the standpoint of statecraft this would appear peculiar. Founders of nations, real and legendary, from Romulus to Captain John Smith, have always sought women to stabilize conditions, realizing that a preponderance of men is dangerous.

However, women are not good recruits to the "industrial reserve army"—not available to break strikes in the industries in which they are most rife. Women are not available in creating the more tangible kinds of commodities which admit of quick realization and profits, in the same proportion as the bulk of male labor.

The increased proportion of women immigrants under the three per cent law is another evidence of the far-reaching effects of that statute. It is only one of many unexpected results already noted, and it is my guess that there are many more which will come to light later. Immigration and the tariff have been the double pivot upon which American history has largely turned—restricted commodity imports and unrestricted labor entry changed America from a nation of farmers, free artisans and small merchants to what we are today. It is not too much to expect that shutting off the cheap and fluid labor supply will tend to throw the current in the other direction—to decentralize the population and to employ the rural workers in winter factory production. But all that is for the historian.

The increased percentage of women immigrants under the three per cent law, however, inevitably brings to the fore another phase of the immigration problem. It brings the hope that one of the darkest phases of the whole alien problem is about to be brightened—that a social cancer long noticeable may be checked if not obliterated.

Good Reasons for Silence

ONE of our many taboos heretofore has been the subject of the moral consequences of the importation of large numbers of unmarried male aliens. It has been permissible to note the life of mining camps in this respect, but the far wider aspects of the vice problem thus created in our cities have been shrouded in silence. In passing, it should be noted that this is about the only phase that has been characterized by silence—every other angle has had too much publicity.

But while there has been almost nothing in print about it, city dwellers have become increasingly conscious of late of the peril to relatively unprotected women of the older stocks involved in their contact in industry and commerce with large numbers of aliens of low moral standards and racial ideals of woman's place and function, which vary widely from those heretofore prevalent here.

There have been good reasons for silence. The subject is freighted with explosive possibilities. It is difficult even to mention it without danger of injustice and wholesale racial libel. Whatever is said of degenerate sections of peoples will be misconstrued by supersensitive individuals of similar origin, or deliberately misstated by racial demagogues—and they are legion.

There is the ever-present danger in discussing such a subject of falling into the same slough of pruriency that now fouls the newspapers, the movies and the pages of current books and periodicals. There is also the peril of adding fuel to fires already smoldering under the social mud-sills—fires which have here and there flashed into crime or even small riots which have mystified those who did not know the real causes.

Known to the Reporters

THESE fires are smoldering. They constitute a social pollution and peril. Silence has failed to help them. Immigration restriction promises to extinguish them. It is right that the American people in deciding the question of immigration regulation now before them should know of every phase of the problem.

In a former article I touched on the fact that newspapers never mention certain racial factors in the problem of vice although these factors are known to every *competent police* reporter.

To this general statement there is one exception—the only one I have ever encountered in many years of newspaper observation. This exception will serve to tell much of what this is all about. The subject can only be handled gingerly, but the fact that it once broke into print makes it easier.

In August, 1920, Mr. Josiah Ward, a column conductor on the Denver *Post*, wrote a very frank story on the conduct of cadets who were trapping working girls by inviting them to ride with them in automobiles, while the street railway was tied up by the strike then in progress.

Mr. Ward's story was printed as written. It set forth quite bluntly that these human harpies were mostly of a very distinct racial type and that their chosen victims were—to use Mr. Ward's language—"white girls"—usually blonds. The cadets, Mr. Ward said, were of the slant-headed prognathus type found on the shores of the Mediterranean Sea in the slums of several of the Mediterranean nations—the relics of the primitive tribes which had been conquered and submerged by the ancient Greeks and Italians, but never eliminated. They flourished most of all in the Levant, declared Mr. Ward, but were swarming into America.

Without going very deeply into history he intimated that these were the descendants of those types who developed the civilizations of Cnossus and Troy—which some archeologists believe were wiped out by the Greeks because of their early developed habits of white slavery and their raids upon the Greek tribes to capture their fair-skinned women.

Brought in by Thousands

A relentless pursuit of the white woman can be observed in any American city! The tragedies of Chinatown, on the Elsie Sigel order, or the police archives of any western city tell our story as to the Oriental. Reporters in Federal buildings watching Mann Act cases are often struck with the remarkable number of such offenses. In an investigation of Chicago dancing academies last year it was noted that girls acting as "individual instructors" were urged by the proprietors to give preference to "foreigners" on the ground that they would spend any amount of money to form the acquaintance of American girls. Police court annals, the stories of rescue workers and juvenile officers all tend to create the same impression.

It is easy to be unjust here, however. There have been plenty of American "cadets" and vice lords—from every stock, colonial on down. Foreign girls are victimized by myriads. Just before the passage of the Mann Act the European vice rings were bringing girls from Poland by thousands—there were cases of these eastern cadets selling their own relatives into white slavery—but that is mostly historical. Undoubtedly today the country or small-town girl who goes to the city to work is the most frequent victim. Usually unsophisticated and reared in the rural traditions which included no race consciousness, they are not prepared to cope with the perils which inevitably surround them. There has been a great deal of talk about providing for the selection of immigrants on the other side. If such a plan should be adopted, why not give young married couples the preference? If every two immigrants meant one additional home, there would be much less work for the police and social workers.

The Jewish Smoke-screen of Falsehood

Concluded from page 9

less anarchistic than extreme critics have painted; and these magazines insist that they have been pro-fair-play not pro-Bolshevist.

> One method of dealing with Bolshevism and Sovietism has not yet been sufficiently tried—telling and retelling the truth, curing misinformation with information, facing reiteration of fantastic claims with reiteration of disillusioning facts, substituting education for denunciation. If Bolshevism had twenty-three million young people in schools and colleges it would be educating Americans and aliens alike, not hysterically shouting about danger, jail and deportation. Shall America be less lightened in her use of education's machinery?

A paragraph in this pamphlet adds: "How many of these bulletins would you like for teachers, classes, co-workers and others who want to think straight about Bolshevism and Sovietism? Special rates for large quantities."

On September 13, 1921, the Institute for Public Service issued a four-page folder, entitled "Educational Review of Reviews, No. 180." The folder was addressed to the head of a New York public school. Accompanying this address, was the following legend:

> *TEACHING THE CONSTITUTION*
>
> The National Security League's survey of your teaching and not teaching the Federal Constitution raises many questions about teaching controversial civics. For the survey report write to Etta V. Leighton, civic secretary, 19 West Forty-Fourth street, New York City.

On the inside of the folder, the text began as follows:

> If you teach the Constitution, will you teach its bill of rights?
>
> The "Rosenbluth case" affords illustration. No child or adult will miss the point or find it uninteresting. Why should not the National Security League and the American Legion jump to the defense of the Constitution over it?
>
> In our free country, under our own Constitution, is an American-born citizen named Robert Rosenbluth, former United States captain, A. E. F., whom our own Federal Department of Justice has injured vastly worse than shooting or hanging could have injured him.

On January 24, 1922, four-page folder No. 198 was issued. The copy I have was addressed to a principal in a public school in the Bronx. On the outer page of the folder was the following:

> *A PLAY BUILDING*
> to
> *REVOLUTIONIZE SCHOOLS*
>
> Last week Superintendent W. L. Ettinger, of New York, said play buildings are needed in congested districts.
>
> Shall play buildings be in addition to or in place of regular elementary schools?

On the inside of the folder, the text began as follows:

> When we think of all the "revisers" who are tinkering at education, the wonder is so few changes are made in fundamentals.
>
> The Rosenbluth case was cited in Public Service No. 264 on teaching the Constitution. Since then the case has been dismissed by Prosecutor J. W. Selden of Tacoma, Washington, with a LONG RECITAL OF INJUSTICES DONE CAPTAIN ROSENBLUTH BY FEDERAL AGENTS.
>
> Now, December 11, five months after the Federal authorities had promised to send evidence, Prosecutor Selden says that with the charge of murder CAME NO USABLE EVIDENCE EXCEPT EVIDENCE OF ROSENBLUTH'S INNOCENCE AND HIGH STANDING AND OF WRONG DONE BY YOU AND ME—100,000,000 of us—through the United States Attorney-General.

Such is the extent of the campaign financed by a powerful racial organization, which did not hesitate even to invade the public schools wrongfully to influence the minds of school principals, teachers and school children against officials of the government.

The Post Office Building, Southern District of New York, Park Row and Broadway, Manhattan, is more intimately known as the "Federal Building." Here for the last few months have transpired the scenes in what has become known as the "Rosenbluth case." The Federal Building in Park Row is an old, old structure, grown stained and musty with age. On the second floor, a small room has been constructed beside a staircase, to house the newspapermen who cover the Federal courts.

These newspapermen tell me that for more than a year it was a daily custom for Jonah J. Goldstein and Rosenbluth to enter their room and beg that statements and interviews be sent to their papers, calculated to create an "atmosphere"—the atmosphere of persecution. When Rosenbluth was arraigned in court, his friends said to the reporters: "That's all wrong about Major Cronkhite criticizing Captain Rosenbluth. The captain knows five times more about military problems than the major ever did. Major Cronkhite got his rank only because his father is an army general."

On the same floor are the offices of United States Attorney William Hayward. Nearly three-fourths of Colonel Hayward's staff and office personnel are members of Rosenbluth's race. That would appear to be enough representation to satisfy any amount of racial ambition. But from the outset, Colonel Hayward has been the target of Jewish attack. It was announced last November, that "in answer to statements by certain Jewish organizations," Colonel Hayward had appointed two of his assistants, Samson Selig and Abraham Solomon, both of Rosenbluth's own race, to take charge of the extradition proceedings. But the racial clamor was only redoubled. The *Evening Globe* headed its editorial columns with the following:

> Mindful of the parallel between the cases of Rosenbluth and Dreyfus, Mr. Hayward has decided that there shall be no "Dreyfus case" in the United States. So he proceeds—*to withdraw the apparently ridiculous charges against Rosenbluth? Not at all*—to appoint Samson Selig and Abraham Solomon as the Department of Justice representatives in charge of his prosecution. Mr. Hayward changes the combination *by appointing Jews to do the persecuting*—and presto! the cases are unlike.

Needless to say, Colonel Hayward is neither "prosecuting" nor "persecuting" Rosenbluth, AND HE HAS NO MORE POWER TO "WITHDRAW THE CHARGES" THAN THE READER HAS. There would be no "Rosenbluth case" in his district were it not for the fact that the American Jewish Committee is fighting his extradition to Tacoma. The writer of the *Globe* was well aware of these facts. But he was merely adding his mite toward creating "the atmosphere."

In Room 314, on the floor above, are held the hearings before United States Commissioner Hitchcock, at which Rosenbluth's extradition is so stubbornly contested. The room is long and narrow. The ceiling is unusually high. The light falls gloomily through tall windows. The chambers are always gloomy in this old building.

Across this room, dividing it in half, is drawn a desk, before which sits the white-haired Commissioner. Before it is a long table, beside which sit Mr. Selig and Mr. Solomon, representing the government. Opposite them are Mr. Louis Marshall (of the American Jewish Committee) and his associates, who are opposing the extradition of Robert Rosenbluth from New York City to Tacoma, Washington, so that he shall not meet the charges that a Federal Grand Jury has brought against him. About the latter are ranged, standing, some 10 members of their race. Among these are some strange, exotic types, reporters for the vernacular press of the East Side. The scene, with its figures and faces, is worthy of one of Hogarth's ancient prints.

Some time ago, when the hearing in the Rosenbluth case had been adjourned for two weeks, one of these Yiddish reporters wrote for his newspaper the following, which is an authentic translation from the original:

> It was made known here that the Department of Justice gave out a warrant for the arrest of the Jewish Captain Robert Rosenbluth, who will be brought to Washington where he will be tried for the murder of Major Alexander Cronkhite, who was found murdered, and the murderer has not yet been brought to light. United States Commissioner Hitchcock announced that Captain Rosenbluth will be tried Friday, November 24.
>
> The murder of Major Cronkhite was committed a couple of years ago. For a certain time Captain Rosenbluth was held under arrest as a suspect in this matter. A Military Commission made an investigation of this murder, and declared that there was no evidence against Captain Rosenbluth upon which they could hold him. The Department of Justice, also, made a similar statement after a thorough investigation, and the Jewish captain was released. But the Department of Justice did not let the matter drop altogether, and when Captain Rosenbluth requested that he be either exonerated or placed under trial, if there is any evidence against him, then the Department of Justice placed him under arrest. It is believed that the whole affair is nothing but a frame-up, by some of his enemies, who want to oust this Jewish captain from his military standing.

Stupid and lying stories of this nature are being published daily, for the purpose of inflaming the rage of the vast Yiddish population of New York's East Side. The fruits of this campaign of malice will be experienced by these unfortunate people unto the third generation.

Writers for racial newspapers have been accustomed for years to depict Mr. Louis Marshall, member of the old-time law firm of Guggenheimer, Untermyer & Marshall, as a kindly gentleman, who devotes his life to works of charity and good deeds. I fear they would be disillusioned if they could view him as I see him now.

Mr. Samson Selig, the aide of Colonel Hayward, light-haired and dignified, stands beside the table, addressing the Commissioner. He cites a precedent which, he asserts, has a bearing on the jurisdiction of the government.

"Oh, we've got all that here, anyhow," interrupts Mr. Marshall, as he takes a volume from the hands of his associate. "We don't want any inferences or surmises." His full lips pursed into a smile, he looks about him for the approbation of his encircling satellites. He plainly shows that "he is running this outfit."

Mr. Marshall pays no attention to the Commissioner. His attitude is overbearing and sarcastic. A man in the uniform of the United States Army stands up to testify. He is the officer of the 213th Engineers who erected the cenotaph in Camp Lewis in memory of his comrade, Major Cronkhite.

"Was that all they brought you from Washington for?" sneers Mr. Marshall.

Robert Rosenbluth all this time has been hovering behind the back of his distinguished counsel. As the witnesses are testifying, he nods and winks significantly to his friends, as if to say: "See what they're trying to put over? But Louis'll fix 'em." Now he bends over his counsel's shoulder, as if to give him some advice.

"Oh, go away, don't bother me," ejaculates Mr. Marshall, impatiently, and the principal in the Rosenbluth case subsides and retreats to the window where the reporters are standing.

Louis Marshall is president of the American Jewish Committee. He is author of a treatise entitled "Is Ours a Christian Government?" in which he disparages the American observance of Sunday (The *Menorah Monthly,* Vol. XX, January, 1896). In the *Junior Plattsburg Manual,* published for the guidance of the students in United States officers' training camps, the statement is made: "The ideal officer is a Christian gentleman, who has no task too small faithfully to perform." When this was called to the attention of Mr. Marshall, he communicated with the publishers of the manual, intimating to them the prospective wrath of his powerful Jewish organization unless they eliminated the term—offensive to him—of "Christian." The publishers succumbed, and changed their text in the next edition to read: "The ideal officer is a courteous gentleman." (Report of the American Jewish Committee, American Jewish Year Book, Vol. 21, 1919. Jewish Publication Society of America, Philadelphia.) Whatever grudge Mr. Marshall has against the term "Christian," it is evidently a very deep-seated one.

If any reader has the curiosity to wish to inform himself of the extent of the campaign conducted by Mr. Marshall and his associates, I refer him to the reports of the American Jewish Committee and the New York Kehillah, together with a chronological record of similar activities, as published annually in the Jewish Year Book, from 1899 to the present date.

The fifth phase of the "Rosenbluth case" will deal with the members of the American Jewish Committee who have interested themselves in this matter, and their motives in intervening on behalf of Robert Rosenbluth.

Where Iron Mines Are Building Public Schools

Concluded from page 10

it do double duty in the cause of education. The principal is invested in bonds of Minnesota school districts at four per cent.

When the average Minnesota school finds it must put up a new building and must vote bonds to do it, it doesn't face the necessity of paying a premium. It doesn't become the prey of speculators and bankers who deal in these securities. It need not contend with unfavorable market conditions, which often make impossible the sale of these bonds at a fair price.

The school district simply votes to issue bonds to the state and authorizes their payment under the regulations provided. The investment board buys the bonds with part of that permanent school fund. When it comes time to make payments, the state auditor makes a levy against the district for the amount, and taxes are collected for it without the school board ever bothering about the matter.

The entire cost to the district is around four per cent, which usually has been much less than if the bonds were sold to brokers. And this four per cent goes where? Why, right back to the schools themselves. Every school in the state shares in the return. When one school needs a new building, in effect, it just gets a little help from the other schools. Profits in the transaction, if there are any, go to the schools and not to the bond dealers.

A year or so ago, the rate on loans was raised from four to five per cent, but it now is to be reduced, probably soon to the old figure. The great majority of the loans now outstanding bear four per cent. I say four per cent—really, there has been a slight additional charge of late. In recent years, one-fourth of one per cent has been added as a special charge to take up a loss to the fund incurred before Minnesota adopted its policy of investing its school fund in its own schools.

The plan proves especially valuable for the small schools in the poorer districts who would find it difficult to borrow money in many cases without excessive interest charges. Most of the loans are for small amounts the majority running from $2,000 or $3,000 to $5,000. Sometimes the loans run up to $20,000 or $30,000, but not often. No school can borrow more than $100,000.

The loans run for short periods, being limited to 15 years. The whole idea is to provide a system whereby the ordinary school without sufficient funds can put up a necessary building and pay for it without running up more interest charges than necessary. Naturally most of the loans go to rural schools or schools in small towns. If a school district can do better by borrowing its money privately, it takes that course, but it is significant that the state investment board usually has more applications than it has money to lend. Altogether, the permanent school fund now is aiding more than 2,000 schools through loans for buildings and other improvements.

The proceeds from the permanent school fund play a very important part in the Minnesota educational program. Last year, the schools got $1,225,000 from the fund. The state one-mill tax added $2.000.000 more. But the state didn't stop there. It spent $4,000,000 more in state aid, chiefly to give the children in the country the advantages of city children.

The Minnesota program calls for the equalizing of opportunities. The state spends $700,000 a year just to transport children to some 300 consolidated schools.

Equal opportunities for all children—that is the aim. Even the iron mines are helping to attain that goal.

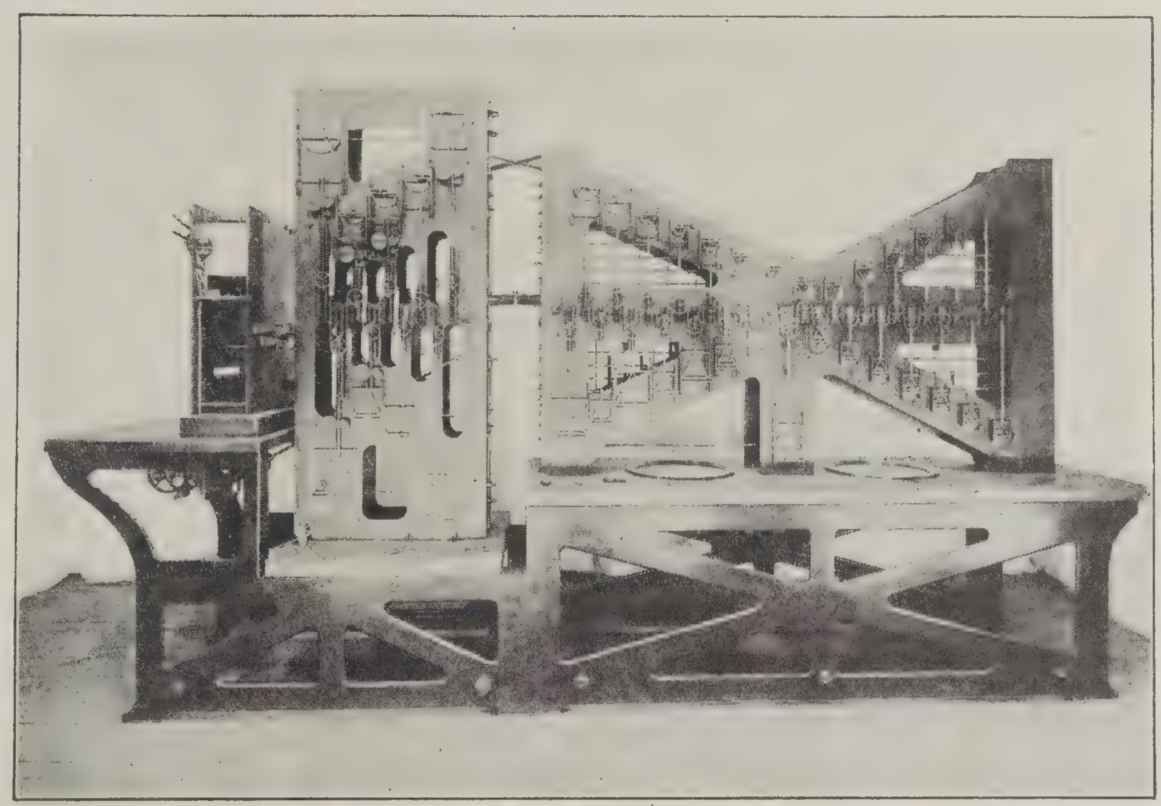
President, Ramsey Institute of Technology, St. Paul, Minnesota.

The Fischer Tide Predicting Machine

MANY kinds of calculating machines have been constructed since the invention of the logarithmic slide rule. One of the most interesting calculating machines ever invented is the tide predicting machine which is used by the United States Coast and Geodetic Survey. To the layman it is a veritable miracle worker for it does with precision the work of 60 trained mathematicians. Mr. E. G. Fischer, a mechanical engineer, is the inventor of this intricate and ingenious device which represents 15 years of untiring work and effort before designs and drawings could be embodied in an operative device. In the United States Government shops doubt was often expressed that Fischer's machine would ever be perfected but the perseverance of the inventor has been rewarded by the complete realization of his dream of many years ago.



The Fischer Tide Predicting Machine used in the Coast and Geodetic Survey.

The Fischer Tide Predicting Machine can reveal with equal ease the past as well as the future concerning the rise and fall of tides. The machine is so delicately adjusted that tide elevations can be estimated in terms of small fractions of an inch. The location of a port is immaterial to this extraordinary device, and tide conditions for the coast of China are as easily solved as for our own coast line. This instrument will compute the rise and fall of the tides for the time when Leif Ericson first visited the shores of America and for the year 2000 with the same ease and precision.

There are 37 principal parts in the device which permit the relative effects of the sun and moon in their various positions to be proportionately duplicated by proper settings in accordance with known data and observations.

After these adjustments and settings have been made the machine is connected to the operative chains and pulleys. By turning a crank, lines are drawn on a chart by means of two fountain pens. These lines show the rise and fall of the tides corresponding to the particular setting of the machine. At the exact moment of high and low tide the Fischer machine locks itself automatically and the operator, by reading the record, may then ascertain the exact tide data for the definite case under investigation. The chart reveals not only the exact time of high and low tide for a particular day, year, and place but it also shows the height of the tide in reference to the mean low level.

The output of calculations credited to this machine may be appreciated from the fact that more than 1,500,000 figures constitute an average annual production. The results of the calculated predictions of this wonderful machine are distributed to mariners all over the world who depend upon them for the safety of their ships. Recently it was announced that the exact times of high and low tides and their height for all the principal ports around the world have been calculated by this machine for the year 1924 and, in a short time, similar data will be available for the year 1925. Unsuccessful attempts have been made by other engineers to construct tide predicting machines.

About 50 years ago, Lord Kelvin, the great English physicist and mathematician, realizing the importance of accurate knowledge concerning the tides to the science of navigation, began a series of investigations for the purpose of producing a tide predicting machine. The work was never completed.

We are indebted to Mr. Victor Carson for information concerning this machine and to Mr. U. V. Wilcox for the photograph.

A British View of Man's Efficiency

AT A recent meeting of the Section of Physiology of the British Association, President E. P. Cathcart, M.D., D.Sc., F.R.S., presented the results of his conclusions concerning man's efficiency regarded from the physiological standpoint.

During his address he pointed out that the leaders of industry have not been slow to accept and utilize the gains of science in the realm of inanimate things, but they have been slow to recognize the fact that there is a science of physiology which deals with the man who controls the productive machinery. New inventions may completely revolutionize shop equipment, good machines may be replaced by better, and better by still better, but man, as a physiological organism, remains almost as immutable as the ages. Physiological development is infinitely slow when compared with the great strides that have been made in the realm of machinery.

"The design of the organism which has to stand the strain," said Dr. Cathcart, "is not at fault. It is an organism which, in the language of the engineer, is abundantly supplied with factors of safety, and has an over-all factor of safety. The body is not designed merely to perform the minimum amount of work or to stand the minimum strain; there is always a reserve. The perfect co-ordination of the different parts of the organism is required, because the human being is capable of intense muscular exertion for short periods. The intensity of the work is, as a general rule, inversely proportional to the length of time during which it must be carried out."

In the human organism we deal not only with a variable capacity to perform work but also with a changing "will to work." The human organism, moreover, may be fatigued and rendered useless, as a working unit, by an amount of work on a particular day which on another day it can perform with the utmost ease and without apparent fatigue. Cathcart and Bendict have tested the relations between the regenerative physiological processes and the rate of performing work by means of a specially constructed bicycle which measured the amount of the work done while its rider was overcoming frictional loads applied to the wheel. The tests showed that the rider consumed less oxygen per minute toward the end of the test than at the beginning and there was also a decrease in the number of revolutions of the bicycle wheel. The remarkable fact, however, was that the relative net efficiency in per cent obtained by comparing the oxygen consumption with the number of revolutions remained appreciably the same despite the fact that the subject of the test admitted that he was practically exhausted by his labor. Obviously, then, a man may be engaged in strenuous labor for many hours without acute signs of impending exhaustion.

Dr. Cathcart enumerates four factors which play predominant rôles in the attainment of maximum efficiency, namely: "the rate of the performance of work, the amount of rest offered or taken by the subject, the rhythm with which the work is performed, and the work habits developed by the worker."

Laulanie's experiments with a work-measuring bicycle proved that when the load becomes excessive the rider's efficiency rapidly falls away. This means that, although the effort may be continued as strenuously as before, and although the physiological cost of the effort remains at a very high level, the amount of external work done is reduced to a very low figure.

Workmen are not so much concerned about the reduction of the physiological cost in the performance of a certain type of work as in the diminution of the conscious effort.

The investigations of Muscio have proved that in addition to the individual muscle rhythm, there is a definite variation in the course of the day in the capacity to carry out work. A seasonal rhythm was also found to prevail. The output of work rhythm for a day is similar to that for a week which shows a low effect for both Monday and Saturday.

Rest is an imperative requisite not merely because of the muscular relaxation which is involved but because it allows the more thorough and complete removal of the waste products and a more abundant supply of oxygen together with the elimination of the strain of attention. Dr. Cathcart states that rest is best obtained not by simple quiescence, but by change of posture; slow movement of another type to that which produced the fatigue, unless the organism is tired practically to complete exhaustion.

One of the chief sources of general inefficiency, disclosed by indisputable tests, is an insufficient intake of food or the consumption of poor or inadequate food. Chronic undernutrition not only lowers the general efficiency but also increases the susceptibility to disease.

In addition to physical influences man is very susceptible to psychic influences and as Dr. Cathcart aptly puts it, "Man is, in the main, a psychic chameleon."

The individualistic influence of monotonous work is another subtle factor which must be appraised at its full value. There are many other factors which play a definite and important rôle in the maintenance of efficiency, such as lighting, heating, ventilation, the mode of life led by the worker outside his definite hours of labor, his housing, weather, heat and cold, and relative humidity. Human progress hinges upon our proper recognition of these potent factors.

BRIEFLY TOLD

The first death among members of the Smith College class of 1883 was recently reported to college authorities. There were 49 members of this class.

The violin of the "fiddling pilot," recorded by Mark Twain, has been insured for $10,000 by the present owner.

From 12 to 14 years have been added to the average human life in the last half century due to the progress of medical science. But 600,000 persons still die in the United States annually from preventable diseases.

The Palo Alto, California, high school girls' glee club has been disbanded by the school authorities because limburger cheese was smeared on the faces of new members initiated.

Judge Ben B. Lindsey, head of the Juvenile Court of Denver, says: "My experience, study and investigation of juvenile life has convinced me that parents need to be taught the fundamentals of child rearing. I firmly believe that not more than 20 per cent of parents are relatively, and comparatively, competent to raise children." The judge is directly and indirectly responsible for the enactment of 52 Colorado laws for the protection of women and children, not one of which has been repealed and 42 of which have been copied in other states.

White elephants are losing caste in Siam, and are no longer revered by the people as in former days. The so-called white elephant is not really white but is lighter colored than the ordinary elephant.

A map of the bottom of parts of the Pacific Ocean is to be made by utilizing a new device for measuring ocean depths by sound waves, according to the Navy Department.

The county commissioners of El Paso County, Colorado, have ordered signboards on public highways of the county removed within 90 days. The signboards obstruct highways, deface the scenery and are dangerous to travelers, the commissioners' resolution says.

A lizard, pierced by a hatpin, is the insignia adopted by the Anti-Flirt Crusade of New York City.

Stumps of tropical trees measuring 14 feet in diameter and estimated to be 10,000 years old have been unearthed 40 feet below the surface of the earth in Washington, D. C.

Fountain pens with glass points are now being made.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

The largest floating dock in the world is being constructed in Scotland for an English railway company. It is made entirely of reinforced concrete.

Not a solitary dyed-in-the-wool fisherman or lover of the outdoors is ever found behind prison bars, according to the Rev. Preston Bradley, pastor of the People's pulpit in Chicago. "Bad men have no love for the out-of-doors!" he stated. "They can't stand it to be alone with themselves. Statistics will show that not one of the major criminals of today liked to fish or loved a dog."

Every drunken man who is arrested in Des Moines will have his picture taken, according to an announcement of the chief of police. When the prisoner has become sober again he will be presented with a picture of himself so he may know how he looked when arrested.

China has contracted with American concerns for radio facilities costing $13,000,000 to be completed in three years.

Potatoes are to be raised on the Tempelhofer Fields on the outskirts of Berlin. These fields were once the largest of the German military training camps and since the Armistice they have been used as public playgrounds.

From the few hogs that were freed on the Island of Santa Cruz in 1547 have come a race of ferocious wild boars, which have lost every trace of their domesticity. They mature enormous tusks, bristles like wire, have long hoofs and can run like deer. They are a plague to the ranchers of the island, eating their garden stuff and goring young stock.

Reorganization of the Missouri, Kansas & Texas Railroad Company has been approved by the Missouri public service commission. The new name will be Missouri-Kansas-Texas Railroad Company.

It is unlawful to cut or injure trees or shrubs within the limits of public highways in Michigan, without a permit from the authorities having jurisdiction over such roads. If any person violates this law by not obtaining the consent of the abutting property owner, in addition to a permit from the highway authorities, he is liable to the abutting property owner for damages. Only by enforcing this roadside tree law can the highways be made attractive.

A French military aviator has beaten all glider records by keeping in the air seven hours and three minutes in a regulation army airplane, with the propeller previously wedged to prevent its operation. The machine carried an extra weight of 500 pounds in addition to its gasoline, motor and oil supplies and was in no way modified for gliding.

Regular shipments of Florida grapefruit reach Georges Clemenceau who became fond of the fruit when in this country. He instructed a fruit concern to send him a box every two weeks.

A waste of $1,740,000 annually results from wrongly addressed mail. The average number of letters received at post offices daily with improper addresses is 375,381 and the salaries of postal employes required to re-address this mail amounts to more than $1,000,000 a year.

A pay-as-you-leave turnstile car is running on Broadway, New York City. An exit at each end has a turnstile and a slot machine. The motorman is equipped with a speedy change-making machine. When the turnstile registers a certain number of passengers, none of whom have left the car, a sign reading "Car Full" is illuminated and no more stops are made until some one gets off.

Bulgaria has a labor army of conscripted workers. Every man between the ages of 20 and 50 is liable to obligatory labor. They argue that this is the only way that Bulgaria can get back on her feet economically, and restore the value of her currency. No man, no matter what his rank and wealth, is excused from eight months' compulsory service. The law will apply to women soon.

Ambergris, used in the manufacture of fine perfumery, is found in the intestines of the sperm whale. It apparently forms because of some trouble with the whale's digestion. It is also used in making oil for the bearings of watches.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

Reconciliation of Estranged Couples Is Sought

CHRONICLER OF THE NEGLECTED TRUTH

Do We Succumb to an Attractive Label? Progressivism, Liberalism, Americanism

The Hokum of the Ad Writer's Era Introduced Into Politics an Effective Means of Swaying Mass Opinion

By LEWIS HARPER

WAY back in Teddy Bear Time, Doc Wiley pointed out that the American people still eat some food, but they BUY labels, dye, gilt and lithographing, when they go to "market"—the city cliff dweller's ornate delicatessen.

The influence of labels is no less potent in other phases of our life, which grows ever more distant from the realities as towering pueblos in slums, grimy or gilded, displace the old-fashioned America of "front yards," cottages and farmhouses.

There has been a deal of chatter in recent years to the effect that political independence has been increasing because the old party emblems no longer exercise their hereditary hypnotic spell. It is true that the rooster, the eagle or the log cabin does not guide the voters' pencils as formerly, but there is ground to suspect that what has really happened is an exchange of talismans. New slogans, shibboleths and battle cries are heard, but what they mean to the voter is something that could stand more analysis than has usually been given it.

Just now we are in the midst of another progressive or insurgent phase of politics. This undoubtedly represents in the main a real forward movement—an awakened popular consciousness and purpose. But it may be thwarted and turned into futile paths by mass manipulation through well-known methods of propaganda advertising.

With the professional politician the new orientation is a matter of observing that political fashion has decreed progressive styles. The "boys" of course lose no time in outfitting themselves in correct political toggery. As employed in the headlines, news and editorials of the day the ever-present terms, "liberal," "progressive" or "forward looker" and their supposed antitheses "Tory," "reactionary" and "standpatter," signify more of phrase carpentering and word marshalling than accurate political analysis. They are too often mere threads woven into myriad fools' caps by adepts in the art of BUNK. This art has probably reached its pinnacle in our time, since the discovery of its effectiveness in war "drives" and their more dubious successors.

The crescendo of buncombe which has been attained by American publicists is the result of the marvelous development of the science of advertising—the most characteristic American psychological achievement. Advertising has begun to color the whole of American life. It is exerting a reflex effect on our national mentality which reminds one of the degenerative influences noted in ancient commonwealths from changes in musical art or the dance. By way of parenthesis it may be worth noting that we have experienced these effects, too, in recent years.

American private conversation and public discussion are becoming a babel of blurb, a smear of superlatives or a cacophonic cascade of denunciation and innuendo. The ad writer's tricks have done their work. There is too much reason to fear that the thinking reflected by this sort of speech is all too accurately mirrored. The jazz of the cabarets is matched in its barbaric disharmonies by the neurotic thinking of the mass. The perversions of the headline writer or the comic strip creators have ceased to be merely humorous. They tell us too much about ourselves or what we are becoming.

When the Labels Are Switched

AMERICAN success in advertising was due to the industrial discovery of truths which were later scientifically treated and analyzed by the founders of mass psychology. Manufacturers of soap and breakfast food were exploiting the group mind long before the university professors had heard of it. But we are beginning to understand now how the herd complex moves nations to war or peace, to reform or revolution or into buying stampedes which make millions for those who know how to announce soaps that float or vacuum cleaners that banish the backache.

Mass movements can be generated or made to turn upon the reiteration of some word, phrase or formula which becomes fixed in the subconscious minds of the people. Implanted there, they produce universal complexes which call forth grandiose hopes and ideals with their associated emotions.

These exalted mystical impulses are usually transformed in time into fanatical devotion to the thing embedded in the group mind, whether it be a reality or a delusion. Fanatical advocacy is of course accompanied by its corollary—intense aversion to unbelievers, opponents or Laodiceans.

What has all this to do with the present political tendency? Are all "progressives" and "reactionaries" mere "subjects" manipulated by suggestion—parrots repeating formulas from the press agents, spellbinders and advertisers who sway them thus? By no means. But great masses are thus swayed, and in a democracy such methods may prove decisive of national destiny. This is no occasion for undue pessimism, however. Germs no longer frighten us as formerly because we know that there are good as well as bad germs.

So there are good and bad agitators, propagandists, muckrakers and reformers. Evils are promoted by mass suggestion but good causes are advanced in precisely the same way. Because millions of people today have been worked up into such a mental state that they will adhere unthinkingly to anything labeled "progressive" and as ardently abhor anything that they are told is "reactionary," is no proof that there are no real progressives and reactionaries, no politics of advance or programs of retrogression and decay.

There are BOTH. They are in intense conflict. BUT THE LABELS ARE OFTEN SWITCHED.

The fact that labels exert such a potent influence makes it easy for the far-seeing and designing to confuse the mass mind.

It is the task of this little piece to attempt to point out the real difference between two marked political and social tendencies now uppermost in American politics. They carry similar "labels" but are radically different in fact. Space forbids any extended investigation of all the gaudily labeled "progressive" and "reactionary" packages offered on the political bargain counters. It is possible, however, that there is a general law or relation among these proposals, which can be indicated. If such a touchstone exists, it should be possible to penetrate to the realities of present political programs and to minimize the influence of the labels pasted on them.

The confusion in American political labels is partly the result of a unique history, the interpretation of which it is believed will clear away the misunderstandings now prevalent.

America made such a leap forward both in the Colonial period and in the early days of the Republic to the conditions which must ever be the true goal of real progressivism that most of our actually progressive movements have been "reactionary" in that they sought to RESTORE a régime of political and industrial freedom and equality of opportunity, that we did not long retain.

Progressivism That Looks Back

PARTLY because of the unmatched eugenic value of the Colonial race stocks and partly because of the unlimited free land at the frontier, the American people, in the early years of the nineteenth century, had attained a social and political status which no other people ever equaled and that we did not preserve. Our cultural and industrial progress since that time is quite another thing, something which, in fact, was partly bought by the sacrifice of the happy racial conditions and unique political justice and efficiency which we enjoyed at the outset of our experiment in self-government.

Possibly no such sacrifice need have been made, if proper precautions had been taken. But advanced as they were for their time, our fathers seem to have lacked the gift of prophecy, although here and there a voice predicted what happened.

It seems certain that they did not foresee the consequences of the subtle social changes being wrought about them as the result of their largely unnecessary HASTE in the material conquest of the continent. It is perhaps superfluous to note that if our fathers were not prophets, we share their defect most notably. As we now flounder about for the most part fearful of the future; because we realize that our scientific and material equipment has forged ahead so much faster than our capacity for social and political understanding and control, if, indeed, the latter has not positively deteriorated, we may well realize that we are our fathers' sons. Our future puzzles us. What wonder that theirs shaped itself otherwise than they willed it?

American progressivism therefore has often looked backward, and rightly. The true test of progressivism is whether it tends to bring about conditions favorable to breeding a better and happier race. That the conditions formerly attained by the American people were far in advance of those prevailing now is admitted by practically all eugenists and students of race culture. Many historians who view the problem from quite different angles agree. Even one of our rather supercilious critics, H. G. Wells, tells us that in our early days we probably produced more "homely happiness" than the world had ever seen before or has seen since. "Homely happiness" is a "bourgeoisie" ideal, repugnant to the mongrel and decadent "liberals" of our artistic slums like Greenwich Village, but it expresses very well the American ideal. This ideal has the sanction of recent profound studies in biological and economic science and conforms to the conditions of racial success that history seems to lay down.

We here reach a paradox, that may well prove to be the touchstone with which to distinguish political movements which are really progressive from those which are headed, unconsciously, of course, toward racial degeneracy and national decay.

It recently became the fashion to picture Western Civilization on the verge of decline or catastrophe. There has been so much of this sort of writing that it has probably lost its effect and few believe that any such peril exists. So many pink prophets have been dishonored by events since the Armistice that both the utopians and the oracles of calamity are now discredited. Most of the prophets are also discounted because they have usually been advocates of the very things that the common sense of mankind has discerned to be the causative factors of the very decadence that alarmed the seers.

When a socialist like H. G. Wells from the ruins of Petrograd sounds a jeremiad to civilization, warning that it must be "salvaged" quick by his prescription or that it will surely die, sensible men cannot fail to note that most of the difficulties and distress of the western world, apart from the direct war damage, trace back to mass movements and policies championed by Wells himself, and all his kind.

When Wells pictures the devastation and despair of Petrograd, we cannot help reminding ourselves that a few years ago Comrade Wells was doing his bit to plunge Petrograd and all other cities into filth, fanaticism and famine.

There is a danger, however, that this reaction against the seers of gloom may blind us to real perils. Americans would do well to consider the striking parallel that can be drawn between the decaying Mediterranean civilization of the second century, as pictured so luminously by Ferrero, and the American republic of 1923.

The second century was an age of marvelous commercial development. Cities grew up with massed millions, while the rural districts writhed in progressive depopulation and impoverishment. The hand of finance was everywhere, interest was one crop that never failed.

The Italian cities were filling up with aliens from the Levant, organized to work as little as possible for as much money or grain as they could extort. The Melting Pot, like ours, was murderously effective, burning up the more valuable racial stocks and leaving the dross and clinkers behind.

Rents were high, landlords grasping. Taxes mounted while new armies of officials, meddlers and tax eaters were springing up on every hand. The cities were filled with actors and artists—who often went on short rations—while the authorities by passing savage laws sought to keep the wretched tenants on the farms. Politicians employed the bonus as a commonplace tactic. Levantine usurers—freedmen of decadent old families—were amassing wealth while the free farmers had been displaced by peons or slaves, who mined the soil as ruthlessly as the tenant farmer of Texas today.

The older stocks who had made civilization possible by their colonizing and organizing ability were fast breeding out, through race suicide, until it had become an almost insoluble problem to find a well-born wife of the eligible families to provide children for the incumbent Caesar. The cost of living went right on up despite all the laws and price-fixing devices, which in the next century prescribed the death penalty for exceeding the legal prices—and the prices still advanced.

The literature of the time was so much like that applauded today, that the American publishers who specialize in modern smut are even now getting out new translations of the second century story tellers.

If an American reader cannot feel a bit of hominess when he looks at this picture it is not the fault of fact.

We know that these conditions foreshadowed a decline. We are justified in drawing the conclusion that the real progressive of the second century would have headed backward to the earlier republic, not forward to the debacle.

Here Are Some Illustrations

THAT true American progressivism has really looked backward, can be established from a very cursory glance at the history of our political struggles and the literature of protest. Even some apparently glaring contradictions conform, when properly analyzed.

For instance, the movement against alcoholism, which began about 1830, is not a real exception, for the whisky menace did not reach its more terrifying proportions with the birth of the Republic, but later. The movement against the peril was almost simultaneous, and by 1855 eighteen states had banned liquor by statute. This goal, won only to be lost in the confusion of the Civil War period, was not reached again until a long struggle had been carried on. In this fight the progressives battling against race poisoning looked backward as well as forward.

Even the anti-slavery movement yields to the "looking backward" test. At the beginning of the nineteenth century slavery was a mild and declining institution, which was expected to pass away gradually of its inherent economic defects. It was later revived by the invention of the cotton gin (a part of the industrial evolution that upset the older Americanism). It was slavery's economic rebirth from the cotton gin and the temporary profits which were possible from it in the clearing of new territory, that produced the abolition movement which in a measure looked backward to the early days of the Republic when the institution was on the wane—not a menace to free soil.

The Jacksonian revolt was a virile effort to restore the conditions of commercial freedom already choked by the nascent high finance of the yet youthful Republic. In three decades that power, sprung from Hamilton's tiny fiscal seedlings, had grown into an all-pervading parasite casting a blight over the American system of economic freedom and independent initiative.

Jackson's fight with the United States Bank is the

On an Andean Sea 12,500 Feet Above Ocean

A Picture of Lake Titicaca and the Country Sacred to the Incas of Old

By CARROLL K. MICHENER

This is the second of several travel articles by Mr. Michener

THE *Yapura,* we knew, from gossip gleaned on the train between Arequipa and Puno, had grown old on its inland sea. It was built in Scotland about the time of the American Civil War, brought over the mountains from Mollendo on muleback—the railway then being unlaid—and only after this tortuous maneuver was it able to achieve its entity as Lake Titicaca's first steamboat.

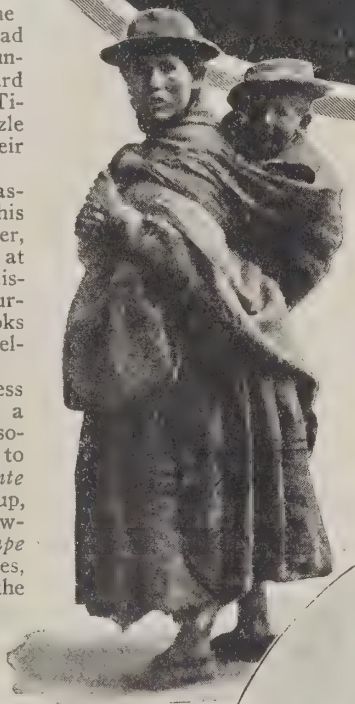
Since it was evident from a mere sidelong glance at the craft's limited bulk that there could be few cabins of the first class, it seemed expedient to inquire of the purser concerning the probability of a stateroom. In Castilian that had an unmistakable high-Andean accent this gentleman vouchsafed the assurance that, should one prove available, it would be assigned in due time. Pre-emption, therefore, seemed a more effective means of reservation.

Others had been similarly inspired, but we were not too late for a cubicle that two might enter, with a due regard for economy of space. Locking our baggage within, we went forth to view the tribulations of our fellow passengers, some of whom were still ghastly with *soroche,* the mountain sickness. This affliction had pursued them all day through the mountain passes, as the train struggled upward from Arequipa. Puno, chief port of Titicaca, was dripping under a cold drizzle from its thatched eaves, completing their misery.

What had threatened to become a passenger list of several hundred had by this time dwindled mysteriously. However, an inspection of the steerage quarters at either end of the narrow steamer disclosed a dusky swarm of humans, burrowing like insects into comfortable nooks among boxes, bales, bundles and miscellaneous live stock.

When the purser's clamorous business was done, the saloon was cleared for a late dinner. All degrees of Peruvian society, from pock-marked aboriginal to haughty and predominantly Spanish *gente decente,* were *vis-a-vis* over the soup, amid odors of perspiration, insect powder and food of other days. The *chupe* was thick, however, with hot vegetables, heavy with meat, and succulent with the piping juices of both. It did much to erase memories of the day's fatigues.

There was, after this, no diversion better or worse than the night-long clangor and smell of the gasoline engines.



An Indian woman of the Andes.

At daybreak we stumbled up a precipitous gangway to the narrow deck, and beheld an astonishing expanse of waters, reflecting the identical colors of the sea. Happily Titicaca was untroubled by spirits of the wind. Tiny wavelets lapped at the sides of the leisurely *Yapura,* whose disputatious motors tugged noisily against the propeller. Deep blue sea reflected the deep blue sky, and from off its surface came a breeze that carried the moist chill of melting snow.

A Sabbath calm settled down, no doubt influenced by the black-bearded *padre,* whose lips silently formed Latin syllables from his prayer book. An American engineer, bent upon La Paz with a program of sewers, charted the scenery with facts. He was an almanac of data. To make sure that there were within hearing the victims of no grade-school negligence he examined into his fellow passengers' knowledge of the fundamental geographical fact that they were upon the "highest navigable body of fresh water in the world, as large as Lake Erie and 12,500 feet above sea level." He inspired them with the thought that for generations there had been an encyclopedic controversy over the ponderous question of whether the waters were or were not slightly brackish.

The atmosphere became increasingly *dolce far niente* as the day warmed. Sunlight, streaming through the thin air of this altitude, smote contrastingly hot where there had been shivers an hour before. Vast ramparts of cloud began lifting from the far edges of a mountain-lipped bowl, revealing snowy surfaces and umbrageous, gashed peaks. These masses of vapor billowed into astonishing forms, seeming always to hang close to the mighty hills, like dirigible giants returning to their hangars. Above the hills were bluish-gray ridges, passing into the soft lilac of the distant Cordilleras, that waste region of mountain snows "where no man goes or hath gone, since the making of this world."

Pomata, a village of adobe huts dimly seen at daybreak, had taken most of the *Yapura's* passengers, and "first cabin" was reduced at *almuerza,* which is the Spanish-American midday breakfast, to few more than the wife and daughter of the American engineer, that gentleman himself, an Italo-Bolivian merchant and his English bride, the *padre,* two Peruvian proprietors of land journeying to Copacabana, and a black-shawled woman proceeding, with a startled apprehension in her coppery, pocked cheeks, to visit a married daughter in La Paz.

In mid-afternoon the *Yapura* trailed its indolent wake into a wide, semicircular bay, as far as the shallow waters would allow, dropping anchor among dense aquatic weeds. We went ashore astride the first boatloads of cargo, landing precariously upon a mud jetty, by means of a plank insecurely balanced by the inconsequent crew. There was much contraband to deliver, destined for the adjacent Bolivian border, and we had half a day for the touring of Yunguyo, mud-walled, squalid and melancholy under the shadow of its medieval church.

Before midnight the *Yapura* was at Copacabana, which lies upon ground sacred to the Incas. The steamer, with much confused ululation from the crew, attached itself to a rocky wharf, and there was a hurry of disembarkation into the town that has been for many centuries one of the great pilgrimage centers of the world. Copacabana, indeed, so the *padre* said, was a holy city, which in Inca days contained an "idol of vast renown among the Gentiles." Likewise it was a place of purification for pilgrims journeying to the fount of Sun worship on the neighboring island of Titicaca.

We were too long over spiced Cuzco chocolate in the morning to catch more than a fleet glimpse of Titicaca, Island of the Sun, and Koati, Island of the Moon, the former celebrated in tradition as the very cradle of the Inca race. They were shaved and barren from a distance, and the regularity of the *andenes,* or irrigating terraces, ridging them from lake level to summit, gave them an appearance of artificiality.

Above—Ancient agricultural terraces and ruins on the shore of Lake Titicaca. Below—Pre-Inca ruins at Tiahuanace, Bolivia.

Reed vessels on Lake Titicaca. At right—An aborignal farmer of the Titicaca region.

There is plentiful legend concerning the origin of the Incas. Most of it is based upon the tradition that there were two Andean creations, the Incas rising from the second. On the genial authority of the Irish steamer captain the entire brood of the first were changed into a swarm of crickets by a demon at enmity with man's primeval maker. This version appeared to differ from others only in the minor circumstance that, according to such dissenting stories, the race was transformed into a multitude of stones. These, ever since, have been justly kicked and cursed by the second brood of humans. In any case, it is generally agreed that, worldly affairs having attained an intolerable state, the great Sun god sent down his children, the Incas, to repopulate and rule the world. They landed, like Noah on Ararat, making sacred the point of arrival, which was the Island of Titicaca. These Inca pioneers—we are indebted not to the Irish captain but to Prescott for this—were a single pair, brother and sister, husband and wife. They proceeded to the present site of Cuzco, where they took up their residence, presumably living happily thereafter.

However it was that the Incas came, it is without question that they conquered an empire more than 2,000 miles long, quarreled over it, and witnessed it crumble—centuries later—before a mere handful of Spanish adventurers. We were here, upon Titicaca, on one of the great natural highways over which the tides of exploration and conquest had poured since prehistoric times; first in the tribal wars that brought consolidation under the Incas, then in the Spanish invasion, and finally in the wars of independence that summoned forth to immortality the great Simón Bolivar and San Martin, those Washingtons of South America.

The diminutive second officer, a dapper Peruvian with two enormous gold teeth, was not too sure of Inca mythology, but he agreed with the historians that the Island of the Moon took its name from the Indian word for queen, and that the Moon was therefore the wife of the Sun. This, of course, was as it should be. It was necessary to listen for the remainder of the forenoon to fabulous tales of gold-plated temples that once crowned these islands; of human sacrifices that splattered the altars with blood; of virgins of the Sun and brides of the Inca, the walls of whose harems are visible even today among crumbling ruins; of aqueducts and irrigation terraces that watered

The Lawyers' "Resolve"

THE stigma given the government as being "a lawyer soviet" would not have meant so much if the legal profession had not permitted itself to become so largely a private business. Every profession that has allowed itself to lose sight of the priestly character of its public service, has inevitably suffered a loss of character.

When the ministry of religion assumed a personal merit, as if the whole of its value to the world was inherent in the individuals who served that ministry, the ministry of religion began to lose caste.

When the ministry of medicine began to regard itself as a private business and its members as the sole custodians of the forces of healing, and pyramided professional frills one above another until the structure grew top-heavy, the ministry of medicine began to recede in public esteem, and is now coming back only by discarding the attitude of mastership, and the resumption of the spirit of service.

When the ministry of the law began to be something else, a truckling in the weaknesses of the very element of law whose strength it assumed to practice, when it began to assume that the law was the profession's private monopoly and not the people's creation, then the name of lawyer lost some of the dignity it possessed in former days.

The reason is that all these are ministries of mediation. The ministry of religion mediates healing truth; the ministry of medicine mediates the healing forces and substances of nature; the ministry of the law mediates justice, and through justice harmony. When, for any reason, the practitioners of these ministries get in the way of the mediatorial work, the declension begins. When these professions of public service degenerate to more or less skillful means of making money, the glory has already departed.

The Association of the Bar of the City of New York, sensing some of these things, adopted as one of its Resolutions last year the following:

> "Since the legal profession has to do with the administration of the law, and since public officials are chosen from its ranks more frequently than from the ranks of any other profession or business, it is essential that the legal profession should not become the monopoly of any economic class."

The Resolution, by protest, admits the thing that has come—servitude to one economic class. This is not true of the ministry of religion; it is not true of the ministry of medicine—at least, not to the full extent. But perhaps it is truer of the ministry of the law than of any other.

The next question is: how are these New York gentlemen of the bar going to get into the service of the other economic classes at present so much deprived of the services of the ministry of the law?

The "Persecuted" Mr. Lewisohn

THE other afternoon the Jewish Women's Club of Detroit had as their lecturer Ludwig Lewisohn, who is the author of an overwrought book, much affected in "radical" circles, the book being devoted to a description of Mr. Lewisohn's persecutions in America because he is a Jew. Readers of the book will have no difficulty, if they are sympathetic folk, in believing that Mr. Lewisohn has suffered, but difficulty becomes impossibility when one tries to believe that Mr. Lewisohn's sufferings were anything but self-caused. His book will find a secure place on the shelves of those who wish to preserve a perfect example of the "persecution complex" in an educated mind. Mr. Lewisohn's sufferings, like those of Alice Adams, grew out of an inordinate self-esteem which, never satisfied, explained its distress by attributing a conspiracy of enmity to others. And out of his sufferings, sacred sufferings he would have us understand them to be, he has made a rather profitable book. The "persecution," as such things usually do, turned out as profitably in comparison for Mr. Lewisohn as for, say, Mr. Paul Warburg. As Jacob Schiff amid his millions used to say, "we poor persecuted Jews."

Well, Mr. Lewisohn has further capitalized his sufferings by appearing in person on the lecture platform, and according to a press report, he had this to say:

> "It is literally true that the heresy of today is the religion of tomorrow, and the blasphemy of today is the truth of tomorrow: then we must teach our children heresy and blasphemy."

It is extremely old, this statement; Mark Twain made a much better modern expression of it; but it never means much in itself; it means most as an indication of the mind that harbors it as a great thought.

"Therefore we must teach our children heresy and blasphemy"—that is the aspect that appeals to the mind enraptured with the thought itself. Therefore we must destroy what is! It is not enough that, to quote Mark Twain's extreme figure, the altar cloths of this generation *may* become the doormats of the next (by reason of nobler altar cloths being woven by the next) but we must pull down the altar cloths of this generation and in the sight of this generation trample them in an effort to see that there shall be no altar cloths for the next generation—that is the aspect in which the doctrine appears.

In other words, it is not the doctrine of the progress of the next generation; it is the doctrine of the destruction of the sanctities of this generation. It is not the doctrine of present good becoming future evil by comparison and because the good has grown to be a greater goodness; it is the doctrine of present evil becoming future good—which is a doctrine of devils.

Mr. Lewisohn may not go that far, but he is headed in that direction. In any event, it is all very interesting when viewed in the light of his voluminous literary plaint of "persecution."

Coddling Our Industries

UNDER the title, "America's Scientific Trade Hari-Kari," the *Pacific Record-Herald,* a brainy paper published in a small town, the editor shows the difference between the United States and European nations in regard to the demand for home production. In substance, he argues that the American will pay a much higher price for imported articles than for domestic goods; while the European always considers the wares of his own country superior to those of any other.

As to the superiority of foreign quality, there is this to say: the pride of individual workmanship, which has decreased to a dangerous degree in this country, is still prevalent on the continent: so that while America has largely mastered the problem of production, parts of Europe still maintain that peculiar quality which is the result of the individual's patience, skill and personal pride in his work.

As the coast paper says: America can produce just as good wares as any country, bar none. But she does not, except in special lines, which readily find a foreign market at prices below the domestic prices. Were America to compel domestic manufacture to meet foreign competition with quality and price, instead of inventing a tariff which compels the people to pay a premium on inefficiency and cupidity, American goods would rival those of the world.

Unusual Court Sentences

AT PRESENT there is a fad among American court judges to impose unusual though not "cruel" sentences for petty offences. One man having been found guilty of failing to give proper care to his horse was sentenced to spend two nights in the horse's stall while it was out to pasture. Others who have been found guilty of cruelty to animals have been sentenced to read "Black Beauty" and give a synopsis of the book to the judge. One man whose flock of six geese were annoying a neighbor was charged by the court to eat a goose a day until the whole flock had been consumed. This latter sentence may be termed "cruel" from one point of view.

Other judges have ordered men to attend church for a certain number of Sundays or in some cases to remain at home in the company of their families for a specific number of evenings.

For reckless automobile driving, offenders have been sentenced to visit hospital wards and see the persons who have been injured. Others have been ordered to visit the morgue or attend the funerals of accident victims. These sentences are intended to be beneficial in impressing on the mind of careless drivers the misery and loss of life which they may cause.

There is a limit, however, and what began in an attempt to apply justice where law was inapt, may end by being a ludicrous fad.

Coue

JUST at the moment Coué is a bigger figure in the United States than he ever was in France. Recently a party of distinguished Frenchmen, comprising statesmen and journalists and other professional men, were at Dearborn, and the name of Coué was mentioned. None of the Frenchmen knew him. All attempts to identify him failed. The journalists made a note in their books to look him up when they got home.

And here is Coué, filling American newspapers and American pulpits with his name. Arrived in New York, and scarcely landed, he begins a series of newspaper articles on his impressions of the United States! One clergyman is threatened with a heresy trial for classifying Coué with Jesus Christ. Physicians and hospital experts, adopting a different attitude than was formerly shown in such matters, express a willingness to believe that Coué does accomplish some good in certain cases.

It is quite a furor—but somehow one keeps remembering the French journalists who wrote down Coué's name, to look him up when they got home. Either France is much slower than the world is accustomed to think her, or America is "easier"—or, but this is the most probable explanation, an American impresario (vulgarly, "press agent") has been requisitioned. It is a marvelously combined American tour and advertising stunt, and the Coué book publishers, and the Coué newspaper syndicates are doubtless aware of flush times.

This is not to disparage Coué. He is very probably a good man and an honest servant of the suffering. His doctrine that the Imagination is more powerful than the Will, is of great importance. His self-effacement proclaims the fiber of his character. But how can he teach us the lesson of liberating ourselves from this mania for foreign celebrities who are not celebrated at home?

Or is it this—Great Britain having pioneered in the game of propaganda by celebrities, France has decided to follow suit? Is Coué really an unofficial envoy of political France anxious to promote American leniency? Doubtless he is, but it is by no means certain that he knows it. On this view, impartial judgment will award the palm to French propagandism. Coué, after all, is worth a whole lot of Sir Philip Gibbses and Margot Asquiths.

Does the College Make the Man?

THOMAS A. EDISON has remarked, substantially, that a college education does not always fit a man for success in life, and that a larger proportion of college men's failures was because they were too proud to work; they had regarded education as a means of lifting them beyond the necessity for work; they had educated themselves beyond their intelligence, and had acquired an academic equipment for professions for which they had no natural equipment.

Mr. Edison's position has been felt by others looking for competent assistance. The characteristics of efficiency are absent in too many cases. Willingness to begin at the bottom and climb through merit is lacking. In too many cases the experienced man is expected to step aside for the college graduate.

All of which is preliminary to the introduction of a criticism of Mr. Edison by *The Associate Reformed Presbyterian,* which insists that a college education has proved the chief factor in carrying men to the front. Of course, the criticism has no bearing on what Mr. Edison really holds, but the logic is so poor it may as well be controverted. Accepting the figures compiled by "Who's Who in America," it says that while but one per cent of the American people are college bred, that one per cent furnishes 73 per cent of those who, because of ability, notoriety, riches, supremacy in the fields of sport and the arts, or what not, have been accorded mention in that book of reference.

Is a man an educator, an author, an artist, a scholar, a lawyer? Naturally he is prominent enough to be admitted to the roll of prominence maintained for reference by delvers into life. Even of the 27 per cent not included among the college-bred, one may find the lineage of any stage or screen celebrity.

The question is, not the proportion of college men to non-college men who succeed, but what proportion of college men are failures, and why. That a college education is a great advantage is very true, but it is also true that the man himself must have the mental equipment essential to success, the absence of which no college education can replace. College can, and sometimes does, discipline brains, but cannot create them.

Mr. Ford's Page

YEARS ago a favorite sermon topic was the need of men to become like little children, and men were urged to try to become like little children, as if the effort would be very hard to make but very rewarding if successful. The point that the preachers missed was that men were children already and needed only to realize it. The childishness of humanity is one of its outstanding points.

Nowadays the emphasis has changed. All the public speakers are flattering the public with references to their "intelligence." The most flattering of the orators speak the veriest nonsense to these "intelligent" audiences, and the strange thing about it is that the audiences are usually cajoled—for the moment—into thinking that as intelligent people they ought to applaud the nonsense. The people are polite. And, consequently, the leaders are misled.

The supposition is that it is a reflection on the people to speak of them as being still in their childhood. The statistics of the War Department, in which are compiled the results of a war-time examination of the mentality of millions of men, and which are sometimes shaken in the nation's face as something to be ashamed of, showed that as a nation we are about 15 years old, mentally.

Shrewd men, seizing upon the fact, and not being able to interpret it, think that here is their chance to capitalize the childhood of the people at a high figure. Of course, those shrewd men always think that they are of an older group, more intelligent, more competent to decide in the people's affairs. So they "write down," and "speak down" and "print down" to the people. They spread cheap sensationalism before the people. They seem to say, "We can do anything to dazzle these 15-year-olds and get away with it."

It is one thing to have found a fact, and another thing to apply it. No discovery has been so badly misapplied as the fact that, as a nation, we are about 15 years old. The conclusions drawn from this fact would indicate that the minds who draw them are not even 15 years old. Whatever may have been your first reaction to the statement of our mental age, it will require only a little reflection to enable you to see that whatever the 15-year-old mentality may be, its widespread reaction against the stuff that has been fed it in every field, is proof that it is superior to the type of mind that would exploit it.

The mistake has been in interpreting what this statement means, that as a people we average 15 years old in mind. It is probably one of the most hopeful facts about us. Certainly it is immeasurably better than that we should be 40 years old in the kind of mentality that counts itself the ruling mind of today. What would probably be called the "mature-minded group" constitutes our most incompetent, erratic and dangerous group, for the most part dead to principle, certainly dead to the principle of unselfish service, utterly dead to the responsibility which even the assumption of superiority would lay upon them.

THE youthfulness of the people is the great safeguard of society. The fact of the people still being young is often misstated, oftener misinterpreted, and ignorantly exploited. Statistics showing that, as a whole, we represent about the 15-year-old mind, are the most hopeful figures possible to read. The world is extremely lucky if this is so. If the diplomats and financiers and exploiters and war-makers represent the mature-mindedness of the world, thank heaven the people are still youthful-minded. The people still believe, and if because of their believing habit they are still subject to deception, nevertheless their very power to believe will ultimately prove their salvation out of all their wrongs. Their wrongs are not their errors —they are the errors of the "mature-minded" of the world.

The people are still youthful enough in mind to believe in principle; they know when a promise is broken and when it is kept; they know when a system works them ill and when a system brings them good; they know truth, or any leaning toward truth, when they see it. It is sometimes thrown against them that they live by their feelings, by their heart, and this of itself would be enough to prove their youthfulness. Only the young and unspoiled, the hopeful and believing, live by their hearts. The old and hardened live by what they call their logical minds, and logical minds are perhaps the most often mistaken instruments in this world. A logical mind can work on the thing as it is, as it is presented; it has no power to sense the imminent disintegration of the very thing it is basing its logic upon, it has no vision of the heart for the things that are coming. To become thoroughly logical, thoroughly rationalized, is to close all the doors but one. The safety of the people is that they have all the doors open, except perhaps one, and that one does not greatly matter.

Because they are in the 15-year-old state, the people dream, "and the dreams that nations dream come true." We don't know the people unless we are a part of them, and this is the great misfortune of so many who think they have been promoted above the ranks of the people; even the thought of such a thing works a severance of sympathy and knowledge. The politicians have been bewildered time and again within recent years by the wholly unexpected action of the people. Why did not the rulers—"the mature-minded group"—know? Why do not economists know whether business is to increase or die? Is it because the popular mind is erratic? Is it because the people do not know two minutes at a time what they think?

Ah, no. The 15 year-old mind always knows what it thinks, but if you are cut off from that mind in sympathy or knowledge, it is you who do not know. That is the recent tragedy of the politicians and economists, they do not know. "Thinking themselves to be wise, they became fools," as the Scripture says.

They have all been at sea because they have been deceived by words. They do not know what maturity the 15-year-old mind can reach, what just judgments it can pronounce, what high visions it can conceive. We have been making all our progress by a standard much more youthful than that—we have progressed whenever we have set a Child in the midst of our social conditions and judged our trend by him, judged the worth of our social system by its effect on him. The child was the standard that drove the commercialized legalized liquor traffic out of the land; the child is the standard which makes war so horrible; what is bad for the child is bad for all.

There are influences at work which our leaders do not see. And this, not because these movements exist "beneath the surface of society" as we are sometimes accustomed to say, but because they exist in the very midst of the real society which the leaders have chosen to regard as immature, unbalanced and ignorant. The newspapers do not report those movements; the newspapers report nothing that does not explode into notice, all ready for their printing. But by the time a movement does this, it matters little what the newspapers say about it—it is already on it way to its final disappearance. This can be said of all the movements that are making noise today. The feverish attempt to "start something" is due to nothing but blindness to what life and destiny have already quietly started among the people. It is like the coming of Spring; it begins far down under the earth and the roots know its coming long before the branches proclaim it.

Even the people themselves, the people whom the wise ones think to disparage by proving their unspoiled youthfulness of mind, even the people silently recognize that the noise of things that are is not the voice which they hear. They are conscious, even in the midst of their support of the sensation of the moment, of a difference between what the superficial world says to them, and what they inwardly hear. This discrepancy which the people feel but do not articulate holds within it lessons for the leaders, holds within it the details of destiny, but pride of mind in "upper circles" prevent them from seeing it.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

How Cleveland Cut Divorce Rate 25 Per Cent

Heart-to-Heart Talks by Estranged Persons Often Turn Couples Away From Courts

By ALBERT SIDNEY GREGG

BRADLEY HULL,

Director of the Bureau of Domestic Relations, Common Pleas Court, Cleveland, who has reduced divorce cases in Cleveland nearly 25 per cent.

BRADLEY HULL, of Cleveland, expert matrimonial peacemaker, has turned the tide of divorces in that city, so that Cleveland, once referred to as a “second Reno,” now leads American cities in the decrease in the applications for divorce.

Two years ago the judges of the Common Pleas Court created a Bureau of Domestic Relations, and put Mr. Hull in charge. His duties are to adjust family differences, if possible, both before and after a divorce petition has been filed. At the time the bureau was created divorce cases had increased to such an extent that they constituted 42 per cent of all civil business handled by the court. The court, by the way, consists of 12 judges, with a few extra ones brought in from other counties now and then to help when the docket becomes overcrowded. At the end of the first year after the Domestic Relations Bureau had been set up the ratio had decreased 33 per cent, and by the end of the second year, the number of applications for divorce had dropped to 25 per cent. To put it in another way, at the time the Bureau of Domestic Relations was created, for every three civil cases of a general nature, there were two divorce cases. A year later this had shifted to one divorce case for two ordinary cases, and now the ratio is one divorce application to three cases of the other kind. This comparison is based on civil actions alone and does not include prosecutions for crime.

Half of Time to Divorces

IN OTHER words, two years ago nearly one-half of the time of the court was devoted to divorces, which were actually interfering with other business. Now about one-fourth of the time is given to divorces.

The drop in Cleveland from 42 to 25 per cent leaves room for a further decrease, but what has been done is very promising. It shows that a large proportion of the differences between husband and wife can be adjusted when such matters are handled by a capable disinterested third person who understands human nature.

Hull is a lawyer. Before taking charge of the Domestic Relations Bureau, he was connected with the Humane Society. In 13 years he has dealt with 20,000 families, and helped to untangle domestic snarls affecting 100,000 persons, counting children and all. Therefore he can speak with authority when he talks about the cause and cure of matrimonial differences.

When I asked him to name the underlying causes of so many divorces, he replied:

“It is difficult to make a short summary that will really be reliable. There are so many variations and exceptions, that each case is almost in a class by itself.

“Selfishness and ignorance are primary causes, of course. Selfishness is back of jealousy, inadequate support, neglect and unkindness. Ignorance is responsible for the inability of a wife to make a home because of a lack of training in early life, also the low earning power of a husband. For this reason a husband will fail to understand a wife’s nervous disposition, and likewise a wife does not understand a man when he gets unstrung. Failure to make allowances for each other’s ailments and limitations cause a great deal of family discord, which sometimes cannot be settled out of court.

“Irritability and outbursts of temper can often be traced back to a physical condition. Thus when a wife gives her husband a ‘bawling out’ for no apparent reason or over some trifle, the husband should consider that maybe she had a hard day of it with the children, or maybe she is suffering from a headache that has ‘driven her wild.’ Men don’t always realize how monotonous it is for a woman to stay in the house all day doing the work and caring for little children who are none too amiable. So when a husband comes home with a grouch in his system because of something that has happened in his business or work, and finds his wife all upset, it is very easy for them to have sharp words or a quarrel. Just keep that matter of physical health in mind and note how much it has to do with temper and control of the tongue.

“The money question is a constant cause of domestic trouble. This includes non-support through incapacity or laziness, the personal expenses of the husband, or by miserliness. Men sometimes waste their money with boon companions and let their families suffer, or, on the other hand, they may be exceedingly miserly and stint the home while they invest their money in property. If the wife is of an aggressive nature either practice is sure to cause a protest.

“Women have seldom upset a home by their excessive thrift. Many have the idea that they are legitimately entitled to get all they can get out of their husbands by wheedling them or running excessive charge accounts. So the chief peril at that point is extravagance.

“There are numerous instances where the wife insists that the husband bring his pay envelope home unopened, and if he wants a little for his personal use, she makes him miserable with her scolding and nagging. On the other hand there are men who are fortunate to have wives who know how to use money judiciously, and who can keep within the family income and save something each pay day. Wives of that sort seldom appear in divorce court, provided the husband is equally sensible.

No Children, Quarrel

“ABSENCE of children is a serious and frequent cause of quarrels which result in separation or a divorce. Without children the romance of married life is liable to wither, leaving the couple with nothing in common. About all they can do is to nurse their own personal feelings and find fault with each other. Couples of this kind often have trouble over the ‘other man’ or the ‘other woman.’ The wife finds an affinity in another man, or the husband tells his troubles to another woman, and then the crash comes. Runaway wives are nearly always childless.

“Mental incapacity plays a large part in domestic trouble. A low grade of intelligence on the part of either man or wife leads to all sorts of complications. When a man and a woman of that type marry we have a problem for the divorce courts and perhaps the penitentiary.

“Young folks of this type rush into marriage heedlessly. Often the man is incapable of making a living, and when he is no longer able to borrow or get credit he disappears.

“Divorces cannot be stopped nor reduced very much until something is done by the state that will prevent the marriage of people who are incapable of setting up and maintaining a home. While I would not impose intelligence tests, I would require all parties who wish to marry to publish their intentions for a week or two before they can obtain a license. That would compel them to think the matter over seriously, and give interested friends or relatives an opportunity to protest. As it is now, they can get a license, and hurry over to the nearest justice and get married without any delay and for a small outlay. The justice now divides honor with the preacher in such matters. This indicates that many young folks have little thought of religious sanctity in connection with marriage, and that may account for the fact that so many justice court marriages end in the divorce court.

The Case of the Mother-in-law

“IN DEALING with the divorce question,” continued Mr. Hull, “we must recognize that family government is not what it used to be before we had so many big cities. I sometimes think that in developing the spirit of independence we have gone a little too far. What has become of the old-time parental obedience? Many homes have no real head. The young folks decide what they are going to do and in place of asking father or mother they merely ‘tell them.’ Hundreds of persons have grown up to regard any kind of authority as something to be hated and evaded. They think of government as an unwarranted interference with their personal rights. And yet if anybody should call them anarchists they would want to fight.

“Many jokes have been perpetrated about the mother-in-law as a family trouble maker. Perhaps they do interfere a good deal, but I would include relatives of all sorts. The mother-in-law figures prominently in domestic relations for the reason that the mother of either party often makes her home with the young couple, or maybe they will go to live with her. It is hard for some mothers to give a daughter up to a husband, and allow him to become ‘first.’ Sometimes a mother clings to her son even after a wife has a claim on him. If the wife is still a ‘mamma girl’ she will side with her mother against her husband when differences arise and then there is sure to be war. Or the mother of the husband may try to dictate to her son’s wife about running the house or caring for the baby. If the wife has any spunk she will tell her husband flatly to ‘take his choice’ between herself and his mother. And that ultimatum may put the young man in a very embarrassing position, provided he thinks a great deal of his mother, is an only son, or in the event the mother ‘has some money.’ Meddling relatives of all sorts, mothers-in-law and all, may disrupt a home that would have become established, if they had not interfered.

“Just now I am working on a rather serious case. A young man of 25 is trying to get his wife away from her people. They have one child. After the marriage they went to live with the father and mother of the wife. The young man was industrious and took pride in handing his pay envelope to his wife intact each pay day. She worked also, while her mother cared for the baby. Later he discovered that the wife was giving all his money and her own earnings to his mother-in-law. Last of all the wife tried to adopt the baby out, as her mother objected to the care of it.

“Then the husband rented a cottage, furnished it, and insisted that his wife live with him. She did for a while, and then returned to her parents. I talked with the young man, and after hearing his story I sent for the wife. She came, but refused to meet her husband. The man is nearly 10 years older than his wife, and the marriage was arranged by the parents of the girl. She consented because as a married woman the girl thought she would have ‘greater freedom’ than as a single girl. Her parents are saving and scraping to get a home, and therefore had an eye on the pay envelope of their son-in-law. In this case I decided that greed was at the bottom of all the trouble, and advised the young man to sue the parents of his wife for alienating her affections. About the only action that will break their influence over their daughter is to show them that their course of action may cause them to lose their money. The money nerve is a very tender nerve, and I sometimes bear down pretty hard on that nerve when I am dealing with people who cannot be moved in any other way.

Oh, Yes! Some Are Happy

“IN ANOTHER case where the young people lived with the parents of the wife, differences were adjusted without a break-up. The young man was able to support a home of his own, but the wife refused to leave. She was an only child and a good deal of a spoiled baby. Finally when I had a talk with her I discovered that her father had threatened that he would never speak to her again if she left him to live with her husband. She was a sensible girl after all, and I was able to show her that her first duty was to her husband. When the girl came out flatly and informed her father that she intended to go with her husband, he stopped objecting, and that was the end of the trouble.

“A young man of 21 took his bride of 19 to live with his widowed mother. He did not work regularly, but his wife worked constantly. The wife wanted him to leave his mother and live alone even if they had to begin in one room. Then the young man took the attitude that his mother needed him. If he had to choose between his wife and his mother, he would stick by his mother because it was his duty. The mother was hale, hearty and comparatively young. When questioned, she blamed the wife for trying to come between her and her son! The mother could not be induced to get out of the way and let the young people live together, and so that case went to the divorce court.”

“Do many middle-aged people come to you for help in adjusting domestic troubles?” I asked.

“Not very many,” he responded. “Most of the applicants are under 35. Our methods are very simple. When a complaint is made I write letters asking the other parties to call and see me. We talk it over as between friends. My next move is to get all the parties together. If I can induce a husband and wife to ‘have it out’ in my presence, the rest is easy. I encourage them to be perfectly frank. There is the utmost privacy.

“If married persons who have differences would be perfectly frank with each other, I would soon be out of a job, and so would most of the divorce court judges. When married folks become estranged, each one nurses a grievance, which is magnified by talking with misguided friends or relatives. Each one is dead sure that the other is entirely in the wrong. What they should do is frankly to try to reach an agreement.”

“After all,” I questioned, “don’t you think there are some really happy marriages?”

“Of course,” he replied with a broad smile. “We sometimes overlook that fact because of the noise made by those who are not happy. Established homes are the rule and divorces are the exception, but the exceptions are in the wrong direction. We must head the other way.”

China's Mary Pickford on the American Stage

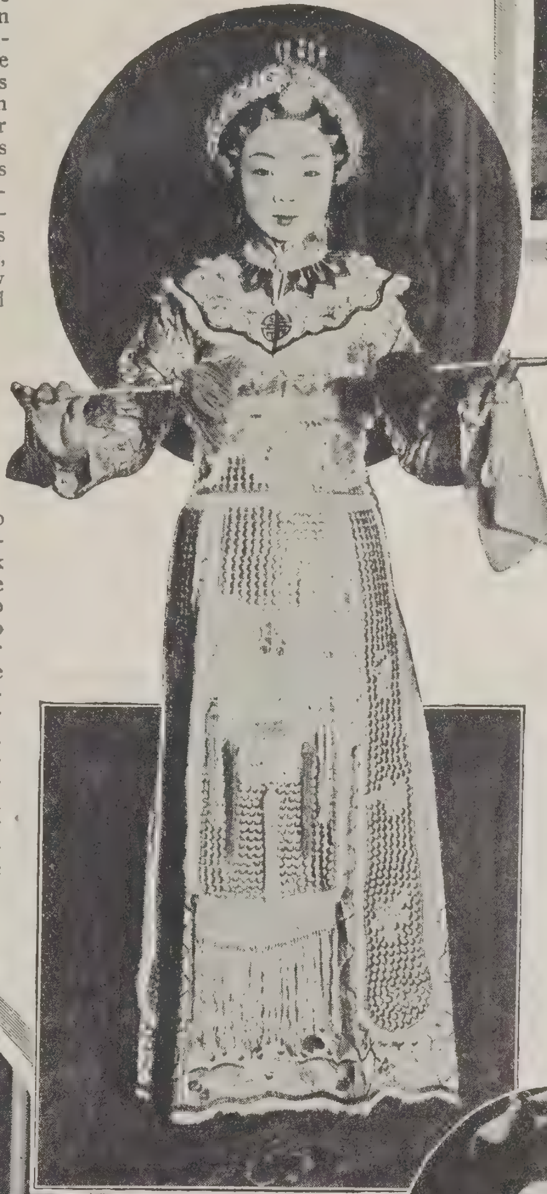
Descendant of a Hundred Generations of Thespians Heads Troupe to This Country

By HARRY H. DUNN

AMERICANS have grown a bit weary of the invasion and conquest of the American stage by Orientals arriving by way of Europe, but for the first time in the history of the theater, the Orient has sent direct to us, across 7000 miles of Pacific sea, a company of its own best players, to present not problem plays, or sex drama, but historical productions, comedies from the days of Confucius, and the love stories of the water-lily and the dragon-fly, the cherry-blossom and the rose, the sun and the moon—those tales on which the myths and the stories of the ages are based. The company is Chinese, the first of its kind to leave China for the New World, and its leading woman is a 16-year-old girl.

There are 25 men in this company, and Lee Sut Moy, the Chinese Mary Pickford, whose ancestry has been on the stage for what she claims as 300 generations, since it is, or was up to a few years ago, a law of the Chinese Medes and Persians that the children of an actor must be actors, or if so unfortune as to be girls instead of boys, to be the caretakers, the slaves of the theater. But it is also written that the Emperor K'ien Lung once fancied one of these young slaves of the stage, took her into his family, and, so great was her influence on him, that thereafter he permitted women who showed great ability in acting and recitation to appear on the stage. Hence we have with us for at least six months, and possibly longer, little Lee Sut Moy, and her company of heroes, heroines, leading men, villains and vamps, character men and character women—all men save herself.

Yun Chong, left, and Yueng Bam Kee, female impersonators, who act the parts of the minor feminine roles in the Chinese plays. The "heroine" of the company, true to Chinese stage tradition, is also a man, Bart Say Jing, who is one of the most famous female impersonators of China, and who knows the lines of more than 1,000 plays, some of them requiring five days in presentation.



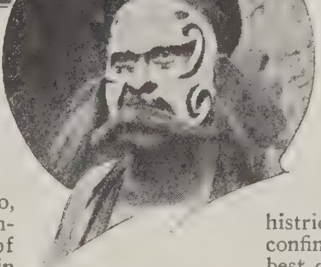
Lee Sut Moy, the Chinese Mary Pickford, descendant of a thousand years and a hundred generations of Chinese Thespians, who is the leading woman of the company.

Moo Sang Yun, leading man, always hero in the play. The swords of the Samurai, which Moo carries, are the marks of his position as hero on the stage.

The company has just arrived in San Francisco, direct from China, with more than 100 separate stage settings, 7,000 different costumes, and quite as many masks, swords, fans, and other "props" without which the Chinese stage is considered incomplete, no matter how elaborately the stage may be covered with chests, suits of armor, trees and other "scenery." Company and equipment are under heavy bond to return to China, but the limits of the bond are such that the season of six months, for which they have agreed to play in San Francisco, may be extended indefinitely for a tour of the other cities in which there are Chinese colonies. So far, arrangements have been made to play in Sacramento, Los Angeles, San Diego and Salt Lake City, where there still are considerable numbers of Chinese.

Tiny Lee Sut Moy, less than five feet in height, slender and straight as an athletic boy, with a foot barely three inches in length, and probably the youngest leading woman in the world, certainly the smallest, is allowed to play no "heavy" rôles. Hers are the clinging vine, the weeping willow, and the blushing rose characters. For the heroic women, Bart Say Jing, the most famous female impersonator in all China, is with the company. He is one of those northern Chinese, powerful enough to impersonate a Valkyrie or an Amazon, if need arose. Lee looks as if she might have stepped from a Dresden China group, or from some old Delft plate, 80 pounds of her, topped with a mass of that kind of hair which makes night merely a passing shadow, and the raven's wing a sort of gray. She was destined for the stage generations before she was born, as were also her brothers and sister, who are now playing in theaters in China. Thus it might be said of her in all truth that she is a "born actress."

The company which she heads—if an actress can be said to be at the head of a Chinese theatrical troupe—was playing in China before little Lee Sut Moy was born, and their fathers and mothers, grandfathers and grandmothers, and all their ancestors much further back than there are records, also had been on the stage, in the case of the fathers, and servants of the stage, if they were on the distaff side of the house. The members of what would be the chorus, if this were an American production, are men, painted like the lily and adorned like the rose, to represent young maidens, though some of them are twice the age, even, of some of our best-known chorus girls on this side the Pacific. It is a queer angle of thought that has impelled the Chinese to impersonate women on their stage, when the women themselves could have been obtained for the characters just as easily as in other countries.



Gee Tai Yuen, the villain.

The Chinese play, with the first real Chinese actors and actress to come directly to this country, was given its first presentation in the old, old Crescent Theater, on Broadway, in San Francisco. The Crescent has housed Caruso and opera, melodrama in less musical interpretation, Spanish plays and players, French comedies and comedians, and, more recently, Bill Hart movies. The only person in the entire company who understands or speaks English is Harry K. Ching, a Hawaiian-born Chinese, who is the interpreter, advance agent, managing factotum, assistant stage manager, and an actor of parts, proving that all the histrionic versatility in the world is not confined to New York, though it thrives best on Broadways, East or West.

Going into the theater under the guidance of this liaison officer between the Chinese Thespians and the American public, one walks unconcernedly across the stage in the middle of an act; no one, actors, audience, stage manager or orchestra, paying the slightest attention. The play, it should be said, was "Mew Fon Woey Gar Yung"—which, being very roughly translated, means "The Tale of a Very Cruel Relative." One of the men—there were several—who had the misfortune to be killed in this play, got up and walked off the stage immediately after he had been slain, instead of waiting for two property men to come and carry him off—the usual and correct manner of disposal of those who meet an untimely end in Chinese plays. Indeed, nothing seems to annoy or upset the actors on the stage during a performance, and their temperaments, if they have any, must be left back stage with their street clothes, for the property men are forever putting chairs around, moving plants, giving an actor a stool to sit on as he begins a long and fervid declamation, and passing on other errands to and fro across the stage. Making up is done right out in the open

The American Jewish Committee Would Substitute Itself for Country's Laws

A Further Chapter of Revelations on the Activities of "Leaders" of Jewry in Behalf of Captain Rosenbluth

By CHARLES ALBERT COLLMAN

THE investigation into the so-called "Rosenbluth Case" discloses proof abundant that a powerfully organized group, which has intervened in this affair, has taken advantage of the circumstances deliberately to provoke a racial collision in the United States. The same group previously made similar attempts, which were abortive. This time it has been far more successful, owing to the preparation for a deliberate campaign, and a much greater expenditure of money and effort.

To the average American mind there is nothing more abhorrent than the exhibition of race hatred. Peoples have emigrated to our shores from every corner of the world, and to each of them we have tendered generously the gifts of equality of citizenship and equal opportunity in endeavor. Now one race—and only one—has raised the charge, which at the present time is reverberating throughout the country, that it is being discriminated against, and denied those gifts which have been accorded to every race other than its own. The present article represents the results of an inquiry into this charge.

Major Alexander P. Cronkhite, 24 years old, a West Point graduate, while training a corps of engineers for over-sea service at Camp Lewis, Washington, was found lying dead from a pistol-shot wound, beside two companions, in a lonely section of the army reservation, on a morning in October, 1918. The two witnesses, Captain Robert Rosenbluth and Sergeant Bugler Rolland R. Pothier, swore before a military board of inquiry that the major had shot himself accidentally.

Pothier Names Rosenbluth

AFTERWARD, Pothier confessed that his testimony had been a lie, and that it was a bullet from his gun that had killed his superior officer. He incriminated his companion. Both men, charged with the premeditated murder of Major Cronkhite, were indicted by a Federal Grand Jury, in Tacoma, Washington, last October, after the last-named body had listened to the testimony of more than 70 witnesses.

Steps were at once taken in New York City to prevent the extradition of Robert Rosenbluth to Tacoma, for fear that the testimony of those 70 witnesses might become public. Three men, prominent in the life of the metropolis, appeared for the protection of Rosenbluth, to provide him with unlimited bail and the means for fighting extradition. They were Felix M. Warburg, of the Wall Street banking house of Kuhn, Loeb & Company; Herbert H. Lehman, of Lehman & Lehman, also Wall Street bankers, and Louis Marshall, law associate of Samuel Untermyer, in the firm of Guggenheimer, Untermyer & Marshall. For years all three have been active leaders in the American Jewish Committee and the New York Kehillah, or Jewish Community.

Louis Marshall is president of the American Jewish Committee, member of the executive committee of the Kehillah, and chairman of its standing committees on legislation. Felix M. Warburg is a member of the American Jewish Committee and of the executive committee of the Kehillah. Mr. Lehman is a member of both bodies, or was until recently, owing to a significant circumstance, which shall be related later.

What the Kehillah Is

THE American Jewish Committee and the New York Kehillah are one and indivisible. The first named has subdivided the entire United States into Jewish districts, District No. XII being the Kehillah. In its turn, the Kehillah has divided the entire city of New York into Kehillah districts.

> The City of New York shall be divided into 18 Kehillah districts, which shall comprise a total of 100 Kehillah Neighborhoods.
>
> Relationship to the American Jewish Committee:
>
> 1. The 25 members elected by the Jewish Community of New York City, as the executive committee thereof, shall at the same time constitute District XII of the American Jewish Committee.
> 2. The American Jewish Committee shall have exclusive jurisdiction over all questions affecting Jews generally, not of a purely local character.
> 3. The executive committee of the Jewish Community of New York City shall have jurisdiction over all questions of a local character.
>
> (Pages 61 to 63, Jewish Communal Register, 1917-1918. Edited and published by the Kehillah (Jewish Community) of New York City.

The professed aims of these two organizations are as follows:

> Constitution of the New York Jewish Community
> (Adopted February 28, 1909)
>
> The purpose of the Jewish Community of New York City shall be to further the cause of Judaism in New York City.
>
> (Page 59, Communal Register, 1917-1918.)

> Report of the American Jewish Committee, 1922-23.
> Act of Incorporation.
> (Became a law March 16, 1911)
>
> The objects of this corporation shall be to prevent the infraction of the civil and religious rights of Jews, in any part of the world; to render all lawful assistance and to take appropriate remedial action in the event of threatened or actual invasion of such rights, or of unfavorable discriminations with respect thereto.
>
> (American Jewish Year Book, 1922-23, page 369. Published by Jewish Publication Society, Philadelphia, Pa.)

The practical execution of these professed aims, however, has been a revelation of the peculiar workings of the Jewish mind. The above two organizations were formed at the time when the country was ringing with the exposure of the "White Slave Traffic," the gravest indictment of racial criminality known to modern times. From the very foundation of the American Jewish Committee and the Kehillah, records show that the efforts of their leaders have been concentrated upon the protection of members of their race accused of crime; the release or pardon of such who were sent to prison or condemned to execution; attacks upon public prosecuting officials; campaigns against religious addresses in the public schools, the celebration of Christmas and the singing of Christmas carols; protests against use of the terms "Christ" or "Christian" in proclamations of governors or other public officials, and the expungement of such terms from books and documents in public use. *Hundreds of instances in proof of the foregoing may be found recorded officially in the annual reports of the American Jewish Committee, the Kehillah, and the chronological "Record of Events," as published in the volumes of the Jewish Year Book, from 1899 to the present date, by the Jewish Publication Society of America, Philadelphia.*

Are Kehillah Meetings Held?

BUT the Jewish Year Book is also the product of the American Jewish Committee:

> *"As usual, the American Jewish Year Book was prepared in the office of your committee."* (Report of the American Jewish Committee, 1921-1922, page 356.)

In the fifteenth annual report of the American Jewish Committee (Year Book, 1922-23, pages 323 to 325), among the members of its executive committee are named Louis Marshall, Albert D. Lasker, Irving Lehman, Eugene Meyer, Jr., and Felix M. Warburg. In the same volume are given the officers, trustees, patrons and members of the Jewish Publication Society of America: Adolph S. Ochs, owner of the New York *Times;* Mortimer L. Schiff and Otto H. Kahn, of the banking house of Kuhn, Loeb & Company; Daniel Guggenheim, Irving Berlin, Julius Rosenwald, Henry Morgenthau and Abram Elkus. A membership of thousands of their race, from every state in the Union, will be found recorded in this volume.

Many of these men enjoy important posts under the Federal Government. Others are bankers and corporation lawyers, who have had opportunity to make generous fortunes in this country. They are often seen and heard at public meetings. But we find them here, secretly allied with organizations and publications, which they are supporting with their money and influence, and which are conducting a campaign of distrust and resentment against the native population. They are countenancing attempts to undermine and destroy "manifestations of Christianity" and "Christological expressions." This is a sorry requital for the benefits they have received.

These facts cannot be denied. The official Jewish authorities have been given for the above statements, and he who runs may read.

Something less than two years ago, THE DEARBORN INDEPENDENT published a detailed story of the operations of the New York Kehillah.

The leaders of the Jewish Community held a stormy meeting, at which mutual accusations were made.

The members of the executive committee refused to let their names come up for re-election.

All open conventions of the Kehillah were abandoned:

> *"No convention of the Kehillah has been held since."* (Report of the American Jewish Committee, American Jewish Year Book, 1922-23.)

Data of the Kehillah's operations for the previous year had already been prepared for publication in the offices of the American Jewish Committee, but they were suppressed immediately. No report of the Kehillah has been published since. And the chronological "Record of Events," so compromising to the leaders of the Jewish Community, also has been discontinued. But secretly the work has gone on with redoubled effort, as the records in the "Rosenbluth Case" show.

When Felix M. Warburg, Herbert H. Lehman and Louis Marshall announced that they had "interested themselves" in the case of Robert Rosenbluth, at the time of his arrest, they committed a provocative act. As leaders of the American Jewish Committee, they implanted in the minds of members of their race a distrust of the native population of the country.

When Mr. Warburg gave bail in the amount of $40,000 for Rosenbluth, and ostentatiously offered his private residence as security, wittingly or unwittingly he cast a reflection upon the people among whom he has elected to live. Mr. Warburg is of foreign birth, and, therefore, it may be that he fails to understand national sensibilities. Surely, he cannot assert that he or his family have ever been discriminated against because of their race. *As a director of the Bond & Mortgage Guarantee Company,* he could have provided bail for his protegé in a more tactful way. He did not display the same humanitarian instinct when the counsel for Foulke E. Brandt sought to obtain bail for that unfortunate lad, who had been sent to Clinton Prison for the terrible term of 30 years by Judge Otto Rosalsky, on a complaint made by Mr. Warburg's partner, Mortimer L. Schiff.

It is not conceivable that well-meaning men could condone the methods by which thousands of unfortunate persons on New York's East Side are being taught, by the printing of false stories, that the United States Government is trying to "frame up a Dreyfus Case" against one of their people.

The Rosenbluth Propaganda

NOR is it credible that they could countenance the attitude of the man whom they are protecting, in declaring that "the United States Army is a rotten and decadent system, responsible for the so-called round robin and its contingent suicides"; and that the Department of Justice tried to blackmail him into getting money for its officials from his "rich Jewish friends." But in his series of attacks published in the *Daily News* of New York, Robert Rosenbluth specifically justifies his statements by boasting that he is being backed by Mr. Warburg and Mr. Marshall.

The propaganda on behalf of Robert Rosenbluth has been conducted most insidiously by means of pamphlets and circulars, and by false statements made in appeals to American Legion posts, university alumni and innumerable organizations and societies. One of the worst phases of this publicity campaign is shown in the literature issued by the "Institute for Public Service," a publicity concern in New York, on which Robert Rosenbluth was once an "assistant director."

This "Institute" *has circularized the public schools,* in an effort *to undermine the faith of American school children* in the United States, with statements such as:

> Five months after the Federal authorities had promised to send evidence, Prosecutor Selden says that with the charge of murder CAME NO USABLE EVIDENCE EXCEPT EVIDENCE OF ROSENBLUTH'S INNOCENCE AND HIGH STANDING AND OF WRONG DONE BY YOU AND ME—100,000,000 of us—through the United States Attorney-General.

In its campaign, the "Institute" sent out the following circular to members of Congress:

> Institute For Public Service
> 1125 Amsterdam Avenue (at 115th street)
> New York City,
> Personal W. H. A. November 4, 1921.
>
> Dear Senator:
>
> A New York *Sun* headline today reads as follows: Senate again orders Watson charge sifted—will trace soldiers "hanged like dogs" story to the bottom—Secretary Weeks will aid—members on both sides agree that army's good name should be cleared.
>
> This headline prompts me to ask if it is not a worse reflection upon the good name of our Army and our country to have an American officer unjustly hanged alive three years after the war ended than even to have an American soldier unjustly hanged dead during the war? And isn't it just as important for the United States Senate to see that hanging alive is made impossible by our Federal Department of Justice as to establish the fairness or unfairness of charges with respect to illegal hangings in France?
>
> I refer to the charges made against Captain Robert Rosenbluth.
>
> Very truly yours,
> Wm. H. Allen.

It may be of interest to learn whether the American Jewish Committee condones or abets the attacks that have been made in racial quarters upon the late young Major Cronkhite and his father. Fnough has been written to establish the reputation which the young of-

Beauties of the Hills and Lakes of Florida

A Visitor to the Center of Southern Peninsula State Tells of Its Attractions

FLORIDA, magic name. As yet it was nothing but a name to me, and before my mind rose kaleidoscopic pictures and jumbled facts, gleaned from books, magazines, newspapers, and movies, shop windows and tourists' tales.

Against an indistinct background, subconscious memories of winter discomforts, slanting snow, whistling wind, stinging sleet, slush, and penetrating cold, grim forebodings of coal shortages and railroad strikes, of wrestling with the heating problem and of shoveling snow from the sidewalks, bright pictures began to paint themselves, swiftly running movie films of imagination.

Skies marvelously blue, dotted with puffy cloudlets that parted and met again in endless fairy formations, or drifted lazily like tiny ships across a tranquil sea. Always the sky is endlessly blue.

White sand against the sunlit blue, white houses with red roofs half hidden in vines, gay blossoms, brilliant plumage bathed in a glory of light. Palm Beach suits, silk sport skirts and softly bright sweaters. Bands playing, flags waving. A gala atmosphere. Chattering people having tea under some flower festooned pergola. Motoring over firm, white beaches on the edge of the ocean, or through luxuriant tropical foliage. Golf and tennis under sunny skies. Swimming or surf-bathing in January. This in the resorts that skirt the coast.

Inland, a vast stretch of flat, swampy land, overgrown with a tangled mass of jungle-like vegetation.

In other words, I had a kind of composite impression, a conglomeration of the average ideas about Florida that people have who never set foot inside the state.

It was chance that took us to Florida, and chance that took us away from the coast towns, where the foregoing description is pretty true to actual fact, and into the inland country which we confidently expected to find a wilderness.

It was with a great deal of astonishment, therefore, that we alighted from a fast express and found ourselves in Lakeland, and it must be confessed that our astonishment has never quite worn off.

I don't know what we expected to find, exactly. What we did find was a pretty city of about 12,000 population, beautifully situated in a slightly rolling country, surrounding or touching nine lakes. It lies almost exactly in the center of the peninsula, the heart of that inland country we had come to seek, and taking it as a probable sample of inland Florida, we looked it over carefully and with some curiosity.

It is a beautiful city, naturally and through the efforts of its citizens. As you step off the train, a small park greets your tired eyes with refreshing greenery. Right in the heart of the city it lies, a kind of big outdoor sitting-room for the community, and especially for the winter visitors. Here you may sit to work or read, play bridge, gossip with your friends, listen to the band or pitch horseshoes. Here you meet old acquaintances or make new ones.

Surrounding this park lies the business section, wide streets always lined with parked cars, smart shops, adequate business facilities of every variety. Farther out along the lakes' shores stretch pretty residence properties, mostly of the bungalow type, though interspersed with more pretentious mansions, always set among smooth green lawns and brilliant flowers, nodding poinsettias and flaming hibiscus, orange bignonia and purple bougainvillea, side by side with familiar flower faces, gay nasturtiums, fragrant roses, and retiring violets.

It is this combination, I think, of which the flowers are but one example, that makes inland Florida so charming. Rolling hills and lake-filled hollows that might be the foothills of New England, save for the silver moss that droops from every tree. A modern, up-and-coming, progressive city, busy, prosperous, efficient, well-lighted, well-paved, good schools and many churches, excellent water, excellent transportation, all the municipal facilities that much larger cities in the North can boast, and many that they can't; a cosmopolitan citizenry, gathered from all over the world, hospitable and open-minded, all set down in the midst of semi-tropical luxuriance and perfect climate. Everything will grow here, almost any time of year. Violets in November; roses in January as in June. Peaches side by side with oranges; tomatoes spring or fall. Everything to all men.

Captivated by its charm and a feeling that at last everything desirable had been gathered in one perfect spot, we stayed. It isn't perfect, really. No place is, and one probably wouldn't like it if it were. But I did feel that here, at least, were all the desirable fundamentals of living, and that the trimmings were being added as fast as was humanly possible.

We amused ourselves seeking some real flaw in our new-found paradise, some need that it could not fill. First we pretended to being tourists, bent on a vacation or seeking a winter home; then to wanting to buy a citrous grove; then to being a farmer; a permanent homeseeker seeking a city residence; a business man; an investor. The results were interesting, and we were not disappointed. What we found to be true of Lakeland can pretty well be considered true of inland Florida as a whole, in varying degree.

Lakeland has not been much of a tourist town, though annually several thousand visitors find their way thither. It lacks, perhaps, the air of fashion, the blair of trumpets, the gala atmosphere that one connects with winter resorts. Yet the tourists come back and come back, and new ones find their way each year.

Part of this is due to climate. Florida's climate is famous anywhere, yet among these inland hills it is even more delightful. The presence of many lakes equalizes the temperature so that it is delightfully brisk but not cold in winter, and delightfully cool in summer, while the fresh pine-laden breeze is both stimulating and soothing. A search of the weather records will not show a summer temperature over 96 degrees, and that not more than once in a season; and, on the other hand, frost is practically unknown.

The latter is the reason why the region around Lakeland, and all of Polk County, is the finest citrous fruit section in Florida, and this is not the least of its charms to the winter visitor. Who of us has not longed to see a really truly orange grove, nor ever quite believed that grapefruit grew on trees?

One of our greatest delights was motoring through this country. The roads are asphalt, wide, smooth, and gray, in perfect condition. Polk County alone has 346 miles of them, all connected up with the main state highways. They roll away invitingly in front of you, up hill and down again, bringing you out suddenly on a crested hill and unrolling a panorama of open pinelands, silver water, groves and country estates.

Oval—Airplane view of Lakeland, showing three of the nine lakes. The business section lies between the two at the back. In the front of the picture is a very pretty residence section surrounding Lake Morton. Left—A glimpse of Lake Hollingsworth. This is typical Florida scenery. Right—Lakeland, Polk County, Florida, has 346 miles of roads just like this.

An American View of the European Muddle

Divergence of French and British Attitude Toward Germany Explained

By WILLIAM ATHERTON DU PUY

I HAVE been over in Europe for a year visiting around and have become pretty well acquainted with some of the nations and their obvious difficulties and requirements. As the banker in the small town in hard times comes to know the problems of the men of that community, the relative burdens that they have to bear, the privations they have to face, the spirit in which they are facing them, the chances of winning through; so may one come to measure quite accurately, I feel, and in a simple and commonplace way, the needs, the sufferings and the prospects of the countries of Europe.

Before the war one would not have thought it possible that nations could stand up under the difficulties that each of these countries of Europe is now bearing, just as it would seem impossible for your neighbor to survive the loss of his crop, typhoid running through his family, and the destruction of his house by fire. But the spark of national life is tenacious as is the spark of life everywhere. Looking back it is easy to recall that prognostication that a war could not be financed for three months, that Europe would starve without the granary of Russia, that it would follow Austria, there at its nerve center, over the precipice. Nations have been meeting impossible conditions right along.

How Swiss Have Suffered

TAKE Switzerland, for instance, there in the middle of Europe, that little country which was entirely surrounded by the war but which succeeded in keeping out of it. Switzerland's chief industry was the making of watches and jewelry. In addition she entertained each year many tourists and her schools were always filled with students from many nations. These were her support, her very life. Switzerland was frugal, industrious, prosperous, upon that European standard which contemplates much hard work and little spending. After the war the currency of Switzerland remained near par with the American dollar. The currencies of Germany, Austria, Italy, France, were depreciated. These countries were producing on depreciated currencies in competition with Switzerland. They paid their watchmakers, for instance, in money that was worth half as much in dollars as was the Swiss money. The possessor of American dollars or English pounds could spend his vacation or put his children in school in other countries at half the Swiss prices. So Switzerland has not sold a watch to the outside world for years. She has received no tourists, few students. Virtually all her sources of revenue have become nonexistent. She has suffered all this because in a chaotic world, she possessed the rare virtue of stability. Yet life has gone on in Switzerland, must go on until conditions come back to normal. Peoples do not perish in the face of financial crises. Their lives go on quite evenly regardless of the coming of the seemingly unendurable.

In Italy there is an equally distressing situation coming about from a quite different set of causes. Italy suffered much in the war, exhausted herself, went frightfully in debt, bought abroad until exchange was forbiddingly against her, suffered a depreciation of her currency until it had but one-fourth of its former value. She is without coal and other raw materials and found herself unable to buy them. Her industry stagnated. She has a great surplus of workers and to her they are a profitable industry. Italy has long exported her man-power and her nationals living abroad have poured gold back into her coffers. The Italian emigrant in the United States, for instance, sends money home to his relatives, is likely eventually to go back to Italy with $3,000 or $4,000 he has earned abroad. But now the lire is so depreciated that it is difficult to buy passage overseas on a dollar basis and the doors of America are virtually closed to the Italian. The emigrant business in Italy has gone on the rocks.

Italians in a Funk

SHIPPING is the second source of revenue to the Italians but her ships are tied to the docks in Genoa and Naples. Industry, shipping, emigration, are gone. Debts are insurmountable. This condition has gone on for years. The Italian is in a blue funk. He sees no way out. He sits tight in desperation and lets the world go by. He gets a glimmer of hope from Mussolini for Mussolini is a change and conditions could not be worse. But the sources of Italy's revenue are gone. They have been dried up for so long that the condition has become chronic. Near famine stalks all the streets. Yet life goes on in Italy. The nation survives. Possibly a better day may dawn. Who knows?

In England again the situation is quite distressing but the trouble fundamentally has a different cause. There are many contributory elements, such as that of meeting an enormous war debt, in the embarrassment of England, but the one major difficulty which if removed would make it possible for her to drive ahead toward prosperity, is outstanding. That difficulty lies in the fact that England had accustomed herself to a market which no longer exists. Germany was the biggest consumer of British products in all the world before the war. Russia was another important market for the tight little island. There were some two million persons in Britain before the war who worked in her industries for the supply of these European markets. The markets are now entirely gone and those two million are idle. Britain is without the profits that came from this trade, but she is also saddled with the difficulties of taking care of these two million workers. The great mass of them are actually receiving subsistence pay out of the public treasury while sitting in utter idleness. I walked the streets of London late at night when people with food in their stomachs slept, and marveled at the number of the members of the underworld that skulked about like ownerless dogs in search of bare bones to gnaw. Providing for those who may not work enhances the burden that the British taxpayer is forced to bear and it comes to pass that the average Englishman who is at work has to give up something near one-fourth of his earnings in taxes.

The crux of the British situation is that of opening up this former market which she had across the channel. It is hard for an American to understand how intense is her concentration of this problem. Naturally Britain is concentrating with great vigor on reviving that market. If one bears this fact in mind he understands much more clearly why England acts as she does in so many of the crises which arise in Europe. Her apparent friendliness to Germany, for example, has its foundation in her desire to get these 2,000,000 Englishmen back into her factories. It would seem a matter of life and death but for these recent demonstrations of the tenacity of peoples.

It is somewhat an odd thing that when in America the talk turns to lending financial aid to the rehabilitation of Europe, the proposal is nearly always to extend that aid to Germany. Industrial Germany, it is stated, is on the very verge of collapse. Unless funds are provided for Germany, it will collapse. Dire pictures are painted of the results that will follow a collapse of industrial Germany. Little attention is paid to the lessons that may be learned from other nations in Europe which have suffered industrial collapse and which have gone on in the face of it ever since the war. In Italy, for instance, industry has been dead for years. In Switzerland the sources from which the people got their living have likewise been dried up for a long time. England has fought her way through conditions as bad as those which face Germany. France is admittedly bearing much heavier burdens than Germany. Little is said of financing these countries which were our allies during the war, but much of financing that nation which caused the world tragedy and yet has suffered less than most.

Distress Noted in Berlin Only

DURING last summer, I traveled very observingly through Germany, visiting such industrial centers as Munich, Leipzig, Berlin, Frankfurt. At that time in all those cities industry was running full blast. Every factory was at work. Virtually all were working three shifts. Everywhere I went the Germans themselves told me that anybody who wanted a job could get it and that the wages were such that they could provide themselves abundantly in Germany with the necessities of life. Only in Berlin were there any evidences of distress, and here they were shown chiefly by that class of people which had made up the official life of Germany or which had formerly lived on unearned incomes. Working people in Germany were comfortable. They were the best-dressed working people in all Europe. The farms were universally cultivated and productive. One could not help feeling that it was only the fringes of the German population that were raveling out. Since that time industrial Germany has been meeting certain difficulties such as the inability to get raw materials and certain of her industries have been curtailed. It is undoubtedly true, however, that German industry today is productive to a greater per cent than is industry in Italy, France, or England, the other first-class powers of Europe. Even were it nonexistent the German stomach would have been empty a bare half year which, from an Italian standpoint, for example, is but the beginning of hunger. Our one-time allies have been desperate so long that we have become accustomed to their emaciated condition but the new supplicant, though still fat, attracts attention.

It is likewise obviously true that the burdens which Germany is bearing in the face of the fact that she is not paying reparations, are much lighter than the burdens that are being borne by other European countries. France offers a striking contrast. In Germany the whole population has the habit of work and the great guaranty which Germany has against disaster is the fact of the great capacity of her people for productive work. The French are likewise a sturdy people much inclined to hard work and frugality, and France is likewise producing. Every acre of farm land in France is yielding crops, but one is much struck by the contrast between the tiny farms of France and the larger holdings and more ambitious homesteads of Germany, which, with herds of dairy cattle and well-filled barns, remind him much of those conditions which he is accustomed to see from a car window while riding through our own Ohio.

The feature of the situation in France is the stupendous burden that that country is bearing. France has her war debt which is greater per capita than that of any other country. She has more derelicts of war to care for than any other country. But aside from this she has huge burdens to bear which are peculiar to her. Devastated regions, for instance. There are entire cities such as Verdun and Rheims, which are being rebuilt from the government treasury. It costs money to rebuild cities of 60 000. Building materials are expensive and this burden is stupendous. Germany has no such burden.

A second burden which is borne by France and not by other countries of Europe is that of little diminished armaments. France today is maintaining an army 800,000 strong. The immediate American reaction to this statement is an assertion that she should disband that army and save the money. France's answer is that she has been attacked and almost destroyed twice in this generation and 20 times altogether. In the face of these facts she cannot bring herself to prescribe to the theory that armaments are no longer necessary. It may not be true, but she nevertheless believes that her national existence depends upon maintaining this army. I can but add my bit of personal testimony bearing on the situation. Everywhere that I traveled in Germany I asked every German I talked to, waiters, chauffeurs, traveling companions, officials, the same question: "Will Germany go to war again?" More than half of them responded: "Not until we get France alone."

France, of course, knows of the attitude of mind on the part of the Germans. Any other nation having suffered the attacks that France has suffered would probably take the same view. She is maintaining this army almost at the price of her own financial ruin and believes firmly that she must do so or die. She may be wrong, but that is her belief.

Thus does France with less than two-thirds of the population of Germany carry two stupendous burdens which do not afflict Germany. Thus does France carry on beneath such a load as is borne by no other country in Europe and do it in a dogged determination to fight out her destiny as she sees it.

France Says Foe Must Pay

FRANCE is determined that Germany shall pay reparations. She is determined also that she shall secure from the nations of the world guaranties against attack. Those are the objects that are back of everything she does in her meetings with other nations of the world. Those objects naturally are quite different from the prime object of Britain, which is to open up markets. The difference in the objects which the two nations are seeking to accomplish is responsible for the unending clashing between their representatives when they meet for conference. An appreciation of the desperate needs of these two nations would make the average American less uncharitable toward either.

When America approaches this international situation, she seems to do so primarily with the thought in mind, that the thing for which she is being asked is money. This impression is quite aside from the fact that the greatest need in the European situation is not loans. Europe needs more than anything else to have two or three troubling issues settled, and to have them written down in plain black and white so that she knows just where she stands. She needs primarily to have reparations reduced to promissory notes so endorsed that they have an actual negotiable value.

She needs a settlement that will make it possible to balance her books. The nations must know what they are to receive and what they have got to pay. Such a settlement depends largely upon a determination of Germany's ability to pay and the issue of her notes to pay in collectable form. This settlement is the corner stone for the rebuilding of Europe's financial structure. It must be laid before construction may be carried further. America's proposal of an expert commission to determine Germany's ability to pay and to write a plan for payment would seem an intelligent and practical step. Any three American business men could arrive at a fair judgment on this point in a month.

Still Want Attack Guaranties

THEN the second fundamental step, the political step, is that of extending to France the guaranties against attack which she requires. In Europe there is a steady approach to unanimity in the conviction that France must be guaranteed against attack. A treaty must be written in which it is set down that in case France is attacked other nations will come to her aid. The power of these nations so contracting must be sufficient that it becomes obvious that any country, falling upon France, would face inevitable defeat. The consensus of opinion is that it is the obvious duty of those neighbors nearest France to come first to her defense, and that the call to arms would be a steadily widening circle that would slowly reach to those nations overseas.

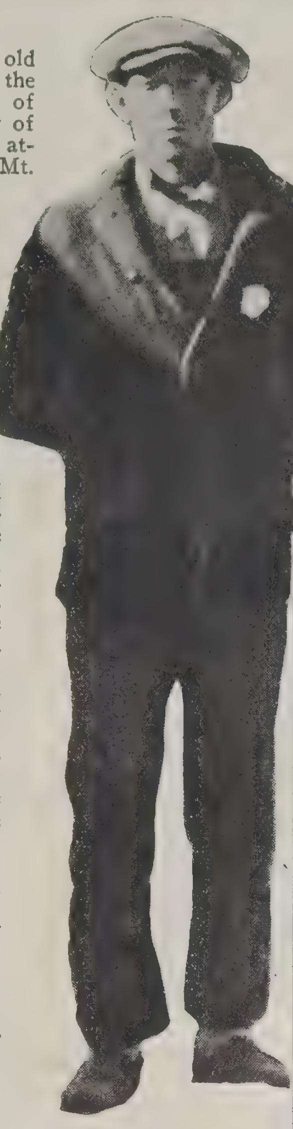
Neither of these fundamental problems in the welfare of the world calls for any advance in money on the part of the United States. They call for wise and disinterested conference and advice. There is in all the world but one disinterested nation with sufficient prestige to make her voice heard almost as a command in the affairs of the world. There is but one logical arbitrator in those affairs and that arbitrator is the United States.

One appreciates the force of that opinion in the United States which leans to the belief that the purpose of Europe is to make this country its financial catspaw and to shift upon it its financial burden. Without admitting that this view is correct might it not be possible for the United States to proceed as though it were? Might she not say to Europe: "We will not finance you, but we will offer our good offices in any circumstances where they can be used without expense to us." Thus might she not be of inestimable immediate service and might she not allow any financial transactions looking to the relief of Europe to rest upon the basis of ordinary business security and take care of themselves as the situations arise.

It is easy to find out what to do if the United States should ever think of changing her Pharisee make-up to that of the Samaritan.

Weygandt of Old Hood

By MEL WHARTON



MARK WEYGANDT

Photos (C) Kiser's Studio, Portland, Oregon.

Above—Weygandt conducting an ascension party past crevasse on northeast slope, Mt. Hood. Below—Mt. Hood, from northeast, bathed in a cloud blanket.

EVERY mood and whim of the hoary old mountain is as significant to him as the spoken word. He studies the humors of Oregon's famed snow peak with the intensity of an idol worshiper. No other man has ever attained the intimate acquaintanceship with Mt. Hood that belongs to Mark Weygandt, ice-pilot extraordinary and plenipotentiary of nature.

For 23 consecutive years Weygandt has conducted ascension parties up and down the treacherous northeast slope of Mt. Hood, considered by expert climbers to be one of the most hazardous feats of scaling in America. Nineteen guides have come and gone in the interim but Weygandt, of good old stick-to-it Holland ancestry, never grew tired of his charge and remained through lean seasons and good, never discouraged and ever firm in his conviction that Mt. Hood and its environs will during his lifetime become a summer and winter playground rivaling in popularity the vaunted Swiss Alps.

More than 5,000 persons have been escorted up the steep slope by the sturdy Netherlander. Not one life has been lost under his guidance although at times he has been forced to tie a life line about the waists of awed ascensionists and shove them over the side of the mountain to make the return descent. Weygandt's present record of 510 journeys to the summit will probably never be equaled. The ice-pilot is yet in his prime and will make many more trips to the top before old age calls him away. He has taken the largest number of persons to the top under one guide when 120 made the ascent in 1914.

Born in Wisconsin, since youth he harbored the longing to be a mountaineer. Pictures of the rugged Alps fascinated him and young Mark often wondered if he would ever see a really big white mountain. The thought became insistent and the boy determined to go to the Pacific Northwest where he could be in the land of snow-mantled peaks. Not having money for rail transportation, he pedaled his way by bicycle to The Dalles, Oregon. Immediately he sought the proximity of Mt. Hood and began his career as mountaineer under the tutelage of a Swiss guide who then conducted ascension parties to the summit.

There are few mountain thrills and experiences that have not been his. He has fallen into crevasses and been covered by thundering avalanches but his uncanny knowledge of iceology has repeatedly carried him through hair-raising ordeals without misfortune. In 1906 this fearless climber placed the American flag on the crest of Pulpit Rock, a protuberance of shale on the north side of Mt. Hood which before and since defied scaling by modern man.

"My most terrifying experience on the mountain top was in 1905 when struck down by lightning," declared Weygandt. "My first sensation was that of being squeezed into a very small parcel. Then as my senses returned the sensation completely reversed and I felt as though I would burst through my clothes. On hands and knees I crawled to the registration box maintained at the summit and scrawled out my name. The jolt took all of the strength out of me but nevertheless the return trip was made without mishap."

Together with an intrepid climber from the Canadian Selkirks who wanted to "try something difficult" the sheer north wall was scaled by the two men in the summer of 1912. That feat has never been duplicated. Pitched for its entire distance of 2,000 feet at an angle of 85 degrees the men made their way like beetles up a tree trunk, literally clinging to the side. Niches were cut in scores of places to afford them hand holds for the next upward step.

The man who lives with the mountain never knew how to snowshoe or ski until he came to the Pacific Northwest. Today he teaches the intricacies of both arts to beginners. There is no more staunch advocate of winter sports in the Cascades than Weygandt. The popularizing of winter sports in the great outdoors of the Cascade range is the hobby of Mt. Hood's most celebrated guide. His mission will have been fulfilled when he has made known to the world the wonders of the Pacific Northwest snow peaks and the enjoyment and exhilaration to be found in their vicinities and when American tourists have learned that it is not necessary to cross the ocean to enjoy mountain scaling and snow sports the equal of any anywhere.

On an Andean Sea 12,500 Feet Above Ocean

Concluded from page 3

and made fruitful an American Eden; of the paternalism of the Incas that made it impossible for man to be either poor or rich—possibly the origin of the Indian's present communistic inertia; of the immense granaries that must have rivalled those of Joseph.

The tranquillity of a land in which nothing seems ever to have happened mantled the sleepy towns of San Pedro and San Pablo, lying at opposite sides of the long Strait of Tiquina. Beyond, lofty slopes introduced a new variety of landscape that was to prevail for the remainder of the cruise. The headlands were bolder, and there was greater evidence of habitation and the fruits of husbandry. /Terraces reached aloft to the very summits of the hills, as in China, and each was a chalice of young greenery. The yellows, reds, blue-greens and oranges of this unfamiliar vegetation were futurist both to vision and to imagination.

A novel means of disembarking was tested at a trading post palisaded by a dense thicket of reeds and aquatic vegetation. Rowboats could not reach the muddy landing, and stubby aborigines waded forth, hoisted passengers upon hips well accustomed to burdens, and carried them pick-a-back to firm ground.

No one hurries in the high Andes, as in the Parisian streets of Buenos Aires. Here there is the traditional spirit of *mañana.* Even the animals seemed to partake of this sentiment. Wherever an ox was seen, it was indolent over its cud; the dogs were languid, though this may have been from an inequitable ration; fish, if there were any in Titicaca's frigid depths, refrained from the exertion of breaking the surface of the water for air; there was no song of birds on land, and rarely a flutter of wings; water birds, principally the familiar hell-driver, fled reluctantly.

In the middle of the afternoon the *Yapura* was anchored off a miserable village, half inundated and half dissolved by the high waters of the lake, which here find outlet. A reedy stream divides the town into separate municipalities, one in Peru and the other in Bolivia. These *villas,* the Desaguaderos, evidenced the keenest rivalry in point of filth and general debility. Yet at the very moment they were threatening to achieve immortality by being the scene of an Indian massacre.

"Señores," explained the *jefe,* "two days ago, at four o'clock in the morning, an immense band of *los indios,* armed with rifles, shotguns, sticks and knives, attacked the neighboring village of Jesus de Machaca. They assassinated the mayor, the priest, and others, including women and children, putting the houses to fire and sack. *Que barbaridad! Que atavismo!* We have not slept since, expecting the like fortune. At dawn tomorrow we may not be among those who are able to greet the sun. Soldiers are coming from Puno, but it is possible that they will be too late."

This was lugubrious, indeed. It seemed necessary to assume a Leather Stocking mood and to sense the thrill of Custer days, but there was too little in the somnolent atmosphere of the deserted brown hills about the Desguaderos to inspire creepy heroics. Undismayed and still slightly supercilious, we went into the telegraph office, where a primitive Morse instrument ticked sleepily and then stopped, even as we wrote out our customary *"reservarme un cuarto para matrimonio,"* designed to insure a sleeping place in the hotel at La Paz.

"No funciona," announced the attendant, with an air of fatality. "They have just now cut the wires. *Si, señorito mio,* we shall all be massacred tonight."

The *corregidor* of Desaguadero, Bolivia, asked his guests to step across the creek into Desaguadero, Peru, and view another exhibit testifying to the mortal peril in which the villages reposed. There the Peruvian police force, consisting of an officer and two men, all unmistakably Indian to within a negligible degree, drove forth a whining, scarred brother who was pronounced to be a spy. He had been picked up the night before on the hills outside the village, bearing the blood marks of a suspicious wound, said to connect him in some occult fashion with the marauders of Jesus de Machaca. At the *corregidor's* command he spread out his armament, a leather thong, a stick, a dozen frozen potatoes and a handful of coarse meal.

Since he had already enjoyed Peruvian hospitality, it was agreed between the amicable officials that he should forthwith be extradited to Bolivia, and this was accordingly done. Repentance, however, overtook the neighboring Desaguadero, after reflection upon the perils of harboring such a creature, and it was determined to pass him on to Guaqui; and no doubt Guaqui relayed him to La Paz or points still more remotely southward. In any case, he was visible again that evening, unmanacled and unguarded, among the steerage passengers, thoroughly enjoying this phase of his adventures, and probably not greatly troubling about the security of his head.

The *Yapura* was anchored off the Desaguadreos for most of the night, but if any of the passengers had even the private hope of witnessing a massacre, he was disappointed. To all appearances the villagers slept, and there were no beacon fires smudging the hills in evidence of an encompassing horde. The only sign of an enemy, through the busy field glasses plied aboard ship during the afternoon, had been a cowherd, enthusiastically considered an Indian sentinel until he ambled down villageward at dusk behind his mild beasts.

Before midnight the promised military aid from Puno arrived, but as rain had begun to fall, it was assumed that all warlike operations would be called off on both sides. The army, therefore, remained snugly aboard ship until dawn.

When we awoke, the Desaguaderos were forever behind us [illegible] expanse of chill mist and water, and before us lay Guaqui, Bolivia, the port of debarkation.

Where Outstanding Scientific Investigations Find Their Inception

Cosmos Club of Washington Leading Gathering Place of Kind in Country

By GEORGE H. DACY

Within stone's throw of the White House stands the Cosmos Club.

The famous Dolly Madison house was purchased by the Cosmos Club and now is used by the wives of the members.

WITHIN stone's throw of the White House at Washington stands the home of the Cosmos Club, the leading scientific club of the country. Resembling somewhat the famous Athenaeum Club of London, the Century Club of New York City, the St. Botolph Club of Boston and the Traveler's Club of England, the Cosmos Club of Washington is yet different from all these in that it lives up to strange ideals. Its membership now includes 1,600 of the most prominent scientists, literary celebrities, artists and others who have done meritorious work. The resident and non-resident members are about equal in number, the latter including many college presidents, eminent scientists, men of art and letters and other leaders in allied lines of effort who occasionally are called to Washington and who always make the curious Cosmos Club their headquarters.

This unusual social center incubates far-reaching and important scientific search and research. Visit the Cosmos Club at most any time of day and you will find there one or more groups of leading scientists discussing this or that intricacy of modern life, industry, art and science. Ensconced in the comfortable leather chairs which are typical of the homelikeness and hospitality of this unique organization, basking in the pleasant glow of the open fires, scientific leaders project plans which may revolutionize this or that branch of human effort and accomplishment. It is not uncommon to see six or seven of the leading Cabinet officers gathered at the Cosmos Club for lunch. The late Alexander Graham Bell was a frequent caller. His son-in-law, Gilbert Grosvenor, president of the National Geographic Society, is now official head of the curious scientific club.

The remarkable and romantic history of the famous old Washington houses which have been united to form the present home of the Cosmos Club—a rambling group of buildings of dignified simplicity—is a worthy supplement to the interesting story of the organization and development of this association of congenial gentlemen which is different from any other social club in existence. Back in 1817, when the Cosmos Club was formed, Washington was the literary and scientific center of the United States. Due to the concentration of the manifold governmental research investigations at the national capital, scientists had assembled there from all parts of the country. Most of them were in the employ of Uncle Sam; the others came to Washington to study history, sociology and economics in the great national libraries and galleries of art and science.

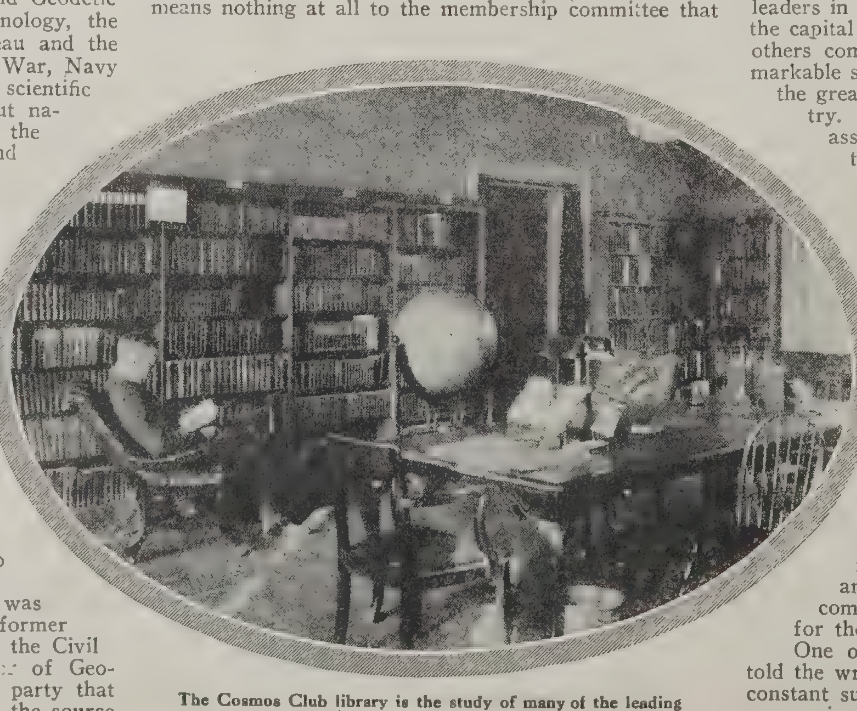
At that period, the Bureaus of Coast and Geodetic Survey, Geological Survey, Fisheries, Ethnology, the Smithsonian Institution, the Weather Bureau and the Department of Agriculture as well as the War, Navy and State departments, teemed with men of scientific training and technical education. It was but natural that these men should congregate for the common expression of scientific thought and good will. They met fortnightly under the auspices of the Philosophical Society in Ford's Theater which, subsequent to the death of Abraham Lincoln, was used as an annex to the surgeon-general's office and as a repository for medical literature.

After the philosophical meetings, the scientists always held so-called "adjourned meetings" at a beer saloon across the street where the technical experts ate pretzels, drank beer and discussed complicated theories and practices. These congenial gatherings were never disreputable or disorderly despite that many of those present were fresh from their scientific studies at Heidelberg and Stuttgart. They conceived a scheme to organize a club and to provide it with suitable headquarters.

The initial meeting of the organization was held at the home of Major J. F. Powell, a former Union officer who had lost one arm during the Civil War. Major Powell was the first director of Geological Survey and was leader of the [illegible] party that explored Grand Canyon and journeyed from the source to the mouth of the Colorado River, one of the most perilous boat trips attempted in the annals of America's development. Major Powell was the kind of man who would choke the mouth of a belching volcano if he thought the spitfire meant anything but fun. At this meeting, Colonel Garrick Mallery suggested that the new organization be called the Cosmos Club. There was some suggestion of spelling Cosmos with a K but it was voted down. The Cosmos Club owes its calm, unbroken record of harmony and prosperity to the original modesty of its aims and to the firmness with which these aims and ambitions have been adhered to from its very institution.

From the outset, the new organization established rigid requirements and a high standard for membership in the scientific association. Its by-laws require that "its membership be selected from those who have done meritorious original work in science, literature or the fine arts or from those who though not occupied in science, literature or the fine arts are well known to be cultivated in a special department thereof, or from those who are recognized as distinguished in a learned profession or in public service." In most social clubs, by-laws are merely by-laws to be made and broken largely at the desire of the members. Most any men of fame and fortune can gain admission to these other organizations if their ordinary credentials are satisfactory and they are properly introduced.

It is quite different at the Cosmos Club. It is an organization that has religiously adhered to the high ideals and standards of its founders. Just because a certain candidate can sign his check for seven figures means nothing at all to the membership committee that carefully considers the qualifications of each candidate who wishes to join this truly great body. It is but rarely that Senators or Congressmen are admitted to membership despite that active eligibility to the Cosmos Club is one of the greatest honors offered by cultured Washington society. Manufacturers, captains of industry and lawyers are occasionally voted into membership because of outstanding excellencies which make them pre-eminent. Some of the most eminent ambassadors and foreign diplomats are on the Cosmos Club roster.



The Cosmos Club library is the study of many of the leading international scientists.

At this writing, the membership of the Cosmos Club is cosmopolitan if viewed from the standpoint of occupations. However, in each instance, the member was only admitted after careful investigation and determination of individual fitness. The present club roster shows that the membership includes geologists, biologists, anthropologists, phytopathologists, chemists, astronomers, writers of prose, poetry and editorial matter, painters, engravers, sculptors, doctors, lawyers, physicians, army and naval officers, teachers and professors, college presidents, bankers, financiers, architects, diplomats, statesmen, superintendents and chiefs of government bureaus.

The original membership was limited to 200 resident and 50 non-resident members but these limits were shortly increased. Right now there are 800 members who live in the District of Columbia while another 800 reside in every state in the Union as well as in foreign countries. As the membership has increased, the demands for larger quarters developed. From the original three rooms in the Corcoran Building, the Cosmos Club has grown to occupy and own the historical home of Dolly Madison and the famous Don Cameron residence which during the administration of William McKinley was occupied by Mark Hanna and was known then as the "little White House." The old stable of Mark Hanna has now been converted into an assembly hall which is used by practically every scientific organization in the city of Washington as a meeting place. One service rendered by the Cosmos Club to the public has been the use of this auditorium on all occasions. There is hardly a week night now but what this hall is used by one or another of the various scientific clubs which compose the Washington Academy of Science.

It would require the sagacity and resource of an ancient chronicler to keep tab on all the scientific schemes which are annually cooked up in the lounge and lunch and library rooms of the Cosmos Club. There gather the leading scientists of the world. Today Washington is easily the scientific center of the entire universe. There are more than 3,500 scientists—many leaders in their particular branches—who live in or near the capital city. Many are on Uncle Sam's pay roll while others come to Washington to gain access to the remarkable scientific records in the Congressional Library, the greatest depository of technical data in the country. The Cosmos Club is the logical center of assemblage for all these celebrities. The doors to this club are zealously guarded but once one is admitted, he is introduced to a type of cordiality, hospitality and courteous kindliness never surpassed anywhere.

An exceptionally fine library of philosophical and scientific literature comprising 4,000 volumes is a special feature of the Cosmos Club while its walls are adorned with masterpieces of art. During its early history, on many occasions, the clubhouse was thrown open to the public, the people of Washington being invited to enjoy art exhibitions. Latterly, as the membership of the club has grown and the daily demands of the members keep all the space in use most of the time, public exhibitions have been discontinued.

An interesting feature of the Cosmos Club is the woman's department where the wives and families of the members are always welcome. Parlors and a dining room are provided for their convenience.

One of the oldest members of the Cosmos Club told the writer that a visit to the club was a source of constant surprise to him. "I am always meeting there some scientist whom I have not seen for many years.

Left—1,600 of the leading scientists, artists, writers and others of unusual talent are members of the Cosmos Club. Right One of the lounging rooms at the Cosmos Club where important scientific research is incubated.

'Hello, John,' I will cry, 'where are you from now?' And he may answer that he has just returned from hunting big game in India or exploring for precious stones in South Africa. Mayhap he is an agricultural explorer who has been making a detailed study of the rare and unusual fruits and horticultural treasures of Japan. Perhaps he has been up near the Arctic Circle engaged in surveys of the ice floes which threaten steamer traffic. Or, again, he may be one of the bureau chiefs in charge of the 350 professional hunters who are ridding the western ranges of dangerous predatory animals. Albeit, I spend an interesting hour or so listening to the inside story of what he has been doing. The Cosmos Club lounge and lunch room are veritable reservoirs of stranger stories of adventure, peril, scientific enigmas and explorations than ever appear on the fiction pages of our leading publications."

China's Mary Pickford on the American Stage

Concluded from page 7

back of the stage, and it is real making up, too, for most of the faces are either hidden behind masks, enameled into fixed stares by means of stiff cosmetics, or covered with black and red and blue scrolls, as in the case of the villain, a burly, good-natured Cantonese, by name Gee Tai Yuen, who impersonates with equal grace male or female villains, though the more delicate touch necessary to create the ancient ancestor of the modern "vamp" is given by common accord to Bart Say Jing.

The scenes, of course, are changed right out in front of everybody, the more easily since there is no curtain, and between the acts the actors, stage hands and everybody else, including some of the audience, run back and forth across the stage in the greatest good humor. What is lacking in curtain, however, is made up in the back drop, which is a heavy black curtain, completely walling in the rear of the stage, and entirely covered with Chinese embroideries which must be really worth a small fortune. These embroideries have been in the possession of the actors of this company ever since they were born, and, before that time, in the hands of their ancestors.

How they have been so remarkably preserved is scarcely less wonderful than the embroideries themselves. On the stage exits are hung placards, bearing the names, in Chinese characters, of the actors and "actresses" on the stage at the time. It requires the full time of two stage hands, in a busy scene, putting up and taking down these placards as the actors and female impersonators and little See Sut Moy rush on and off the stage.

The orchestra, which consists of five Chinese musicians, with Chinese instruments, plays all the time. Since the shortest Chinese play—a brief comedy—requires five hours of steady acting to present it, this means that the orchestra does at least 35 hours of continuous work very week, as compared with the two hours a night, 14 to 16 a week, played by American theatrical orchestras, who get payed for 48 hours' work. Quite evidently there are no musicians' unions in China. Inasmuch as Chinese music is pitched in a high key, and the more it wails the better the audience is pleased, all the actors adopt high falsetto voices to carry over not only the footlights, but the noise of the orchestra as well. This makes the theater a veritable bedlam of sound, amid which the constant chatter of the audience ebbs and flows like an undertone of waves breaking on a sandy coast.

And the audience ebbs and flows, too, at will, especially in those plays which require five or six nights of five or six hours each for their production. The audience also eats and smokes, in the theater, if it wishes to follow the play closely, but it really does not matter, since the dialog is so voluminous and the speeches so long-continued, if a man does go out for dinner, for he can pick up readily the thread of the play after an hour's absence. There is no hurrying in the acting. The men, and the imitation women, on the stage, move with all the deliberation of the play itself, and since there are neither prompters nor callers, each member of the cast seems to go on the stage when he is so disposed, though probably he gets there at the time he is supposed to arrive to preserve the continuity of the plot.

There is some accounting for this individuality of manner in taking cues and going on and off stage from the fact that every actor in this company, and the little Lee Sut Moy as well, knows every word in more plays than will be presented in the entire six months the company will spend in San Francisco; more, in fact, in all probability, than will be played if and when the company tours other cities. The children of Chinese actors, destined by tradition, custom and virtually iron-clad laws of precedent, are trained from the time they begin to talk to memorize plays, comedies, tragedies and the famous long-winded historical plays, of which the Chinese are so fond, and which make up the backbone of the dramatic literature of the race. Thus, every actor in this company, as in other companies of native-born Chinese actors, knows not only his own part in 50 to 100 plays, but all the other parts in the play as well, though nowhere in theatrical work is the line between those who play hero, villain, character, feminine and other parts drawn so strictly as on the Chinese stage. The son of a Chinese actor who has played the part of a villain all his life, usually is trained to play the part of a villain; the son of a popular hero is taught to play hero parts; the son of a female impersonator is trained to be a female impersonator, and so on.

Quite naturally, through such life training as this, these people of the Chinese stage possess remarkable memories. It is recorded in the annals of these mimes of the Orient that one of their number, who is still alive, though too old to appear on the stage, had command of all the parts in 500 plays. One result of this condition is that in Chinese acting, attention is paid almost entirely to the declamation, rather than to the action.

Except on such occasions as it becomes necessary to kill some one in the play, there is almost no moving about the stage. The hero takes a position; the villain another; the "leading woman" another and there they talk, talk, talk. An hour's speech is not particularly long to be put into the mouth of an actor of exceptional recitative ability, and when the play calls upon Lee Sut Moy, or one of the female impersonators to look out of the window, one of the property men walks softly on the stage and holds in front of the player requiring it a curtain, with a window cut in it, out of which the player looks.

Though magnificently supplied with tables, stools, screens and embroidered backgrounds, as well as signs, the stage contains little of what we call "scenery," and a play may range through several scenes and acts without any change being made in the setting.

The audience receives tonight the program for tomorrow night, as it received last night, the program for tonight. There is no applause, but there is much laughter; no tears that I was able to observe, but a great deal of talking, evidently comment, not so much on the acting or on the manner of presentation, as on the text of the play.

Those who were so inclined, put on their hats; those who did not, left them off, and if a man in the audience—almost entirely composed of Chinese men—recognized a friend on the stage or in the orchestra, he climbed up on the stage and had a chat with him right there. The orchestra, by the way, also is on the stage all the time, and not down in a pit during any part of the performance.

This company of Chinese players, in common with others which have appeared in the Philippines, the Hawaiian Islands, and other lands foreign to China, is financed by a company of wealthy Chinese. A certain amount is allotted to each player for costumes, make-up and other expenses; but beyond this, he must provide his own equipment, and, in the case of virtually all the members of the present company, this allotment paid for less than one-third of the costumes and other equipment.

In China, however, the costumes of an actor are to him what his kit of tools is to a carpenter in this country, an equipment without which he cannot get a job, though few Chinese actors are ever out of work, since they are born to their jobs, and rarely does a person born of other than actor parents attain further than a servant's or workman's position in connection with any Chinese theater.

Lee Sut Moy's costumes, for example, number 345, worth an average of more than $100 each, based on their cost in China, a land of cheap labor and low-priced materials. She wears frequently a dozen costumes in one play, and some of the men who play the female rôles are compelled to make more than this number of changes. Much of the so-called scenery, especially the embroideries and hangings, belong to the actors, having been handed down to them through generations of actor-ancestors. The players are paid according to the size of the audience at each performance, and some of them, including the little Chinese Mary Pickford, received as much as $2,000 for their first week's work in San Francisco.

The average, according to the interpreters, is about $500 a week, but, as on other stages, the prominent actors receive salaries disproportionately larger than the others of lesser fame.

How Our Writers Are Ruining Our Forests

Countless Carloads of Present-day Banalities Produced at Heavy Cost

By JOHN BASIL BARNHILL

A GREAT prophet once said: "Come with me to a monster printing plant and see it vomit forth its bile." No more pressing question weighs upon the conscience of humanity than this: "What can be done to save the impressionable minds of the youth of today from the mass of erotic, neurotic, tommy-rotic filth which assaults it from every quarter?"

If the writer were a millionaire and a benevolent one he would feel strongly tempted to offer an irresistible reward in the form of a life-pension to all writers of contemporary fiction who would promise never to write another line; if these perverters of youth and wasters of precious time say, "We must live," we might reply, in the language of Voltaire, "We do not see the necessity" and at all events their plea would be more appropriately referred to the committee on charity. Considering the damage the creators of our present-day fiction do to the cause of culture it would be hard to offer too liberal a reward if they will faithfully abstain henceforth and forever from putting pen to paper.

To produce countless carloads of their baled banalities we are today cutting down our most valuable and none too plentiful forests: it would be better to endow these writers with an ax rather than with a pen for they could then attack the trees without at the same time attacking the interests of real culture.

If we are to save the rising generation from the Juggernauts of the printing press which are now tearing down our forests to commercialize their filth and imbecilities, we must employ heroic methods. Schopenhauer goes so far as to affirm that a conspiracy exists among publishers to force bad books on the public. He says: "Under the system that prevails at present, literary journals are carried on by a clique and secretly perhaps also by booksellers for the good of the trade; and they are often nothing but coalitions of bad heads to prevent good ones succeeding. As Goethe once remarked, "Nowhere is there so much dishonesty as in literature." Elsewhere Schopenhauer refers to the "number of bad books, those rank weeds of literature which draw nourishment from the corn and choke it. The time, money, and attention of the public which rightfully belongs to good books and their noble aims, they take for themselves: they are written for the mere purpose of making money or procuring places. So they are not only useless: they do positive mischief. Nine-tenths of the whole of our present literature has no other aim than to get a few shillings out of the pockets of the public; and to this end author, publisher, and reviewer are in league."

"Let me mention," continues Schopenhauer, "a crafty and wicked trick, albeit a profitable and successful one, practiced by litterateurs, hack writers and voluminous authors. In complete disregard of good taste and the true culture of the period, they have succeeded in getting the whole of the world of fashion into leading-strings, so that they are all trained to read in time, and all the same thing—namely, the newest books; and that for the purpose of getting food for conversation in the circles in which they move. This is the aim served by bad novels, produced by writers who were once celebrated—as Spindler, Bulwer-Lytton, Eugene Sue. What can be more miserable than the lot of a reading public like this—always bound to peruse the latest works of extremely commonplace persons who write for money only and are therefore never few in number? And for this advantage they are content to know only by name the works of the few superior minds of all ages and all countries. Literary newspapers, too, are a singularly cunning device for robbing the reading public of the time which, if culture is to be attained, should be devoted to the genuine productions of literature, instead of being occupied by the daily bungling of commonplace persons."

Those who are charged with the responsibility of the moral and mental welfare of the rising generation ought to take a bold stand against the corrupt and corrupting influences of the cheap and vicious literature of the day. They should impress upon the young that every bad book they read keeps them from reading a good book. There are three rules for the guidance of all who seek the best and highest in literature.

1. Schopenhauer's Rule. Never to read a book written primarily for gain. Such a book never can be on the side of real culture—no, not even by accident.

2. Emerson's Rule. Never to read a book which is not at least a year old—"read not the times, read the eternities."

3. READ NO WORK OF FICTION PUBLISHED IN THE LAST FIFTY YEARS.

We humbly beg the pardon of the novelists with whom we are fatally contemporaneous for thus putting them on our Index but any rule less sweeping would jeopardize the interests of the young for whom our rules are constructed. Our prohibition is not a narrow one. It admits George Eliot, Dickens, Thackeray, and the Bronte sisters, and surely any well-wisher of the young will plead for these and for Cervantes, Fielding, Scott, Defoe, Poe, Hawthorne, Herman Melville, Hugo. To give these masters a chance it is necessary to proscribe all novels of the last 50 years.

One word to all literary procurers and obscurantists: Interrogate your consciences, Gentlemen of the pen: can you honestly say that you have sought, as Ruskin did, to stop the reign of intolerable iniquities? Did you always subordinate the desire to be a best seller to the infinitely higher one of being a best giver, a giver of your best efforts to those seeking light and truth? If the race goes down to disaster, no small amount of the credit for this universal debacle will justly lie at the door of the time-serving, self-serving writers of today, who, after betraying their fellow men in the profoundest possible manner, will pass from an existence they have degraded and disgraced with the dying regret that they have but one life to prostitute to the greed of gain or the embellishment of lust.

"Time destroyed is suicide where more than blood is spilt": to realize this and to realize that a universal conspiracy exists against the wise expenditure of his time is the first and most important duty of the young student. The rules above stated will save the student from those who have designs upon his purse or upon his time. Furthermore, in the fight against the vice, imbecilities and trivialities of the movies it will be found that the strongest weapon to put in the hands of the young is a taste for the noblest masterpieces of literature.

We close with these golden words from Schopenhauer:

"You can never read bad literature too little, nor good literature too much. Bad books are intellectual poison: they destroy the mind. Because people always read what is new instead of the best of all ages, writers remain in the narrow circle of the ideas which happen to prevail in their time; and so the period sinks deeper and deeper into its own mire. There are at all times two literatures in progress, running side by side, but little known to each other: the one real, the other only apparent. The former grows into permanent literature; it is pursued by those who live *for* science or poetry: its course is sober and quiet, but extremely slow and it produces in Europe scarcely a dozen works in a century; these however are permanent. The other kind is pursued by people who live *on* science or poetry: it goes at a gallop, with much noise and shouting of partisans; and every twelvemonth puts out a thousand works on the market. But after a few years one asks, Where are they? Where is the glory which came so soon and made so much clamor? This kind may be called fleeting and the other permanent literature."

On Trying to Get Something for Nothing

THE first man who got something for nothing started the social problem. He who induces humanity to adopt a social system which gives something for something and nothing for nothing (*quid pro quo*) will have solved the social problem. The supreme issue challenging man's best effort is this: to separate the shirkers from the workers and give to each his proper reward—all the product to the workers, nothing to the shirkers.

Lincoln once alluded to the "human wriggle to live without work." On another occasion Lincoln said: "Sitting here, where all the avenues to public patronage seem to come together in a knot, it does appear to me that our people are fast approaching the point where seven-eighths of them are trying to find out how to live at the expense of the other eighth." Julian Laughlin, in his "History of Civilization," reduced the teaching of history to the following terse proposition: "The state, that is, the unproductive classes, of the ancient world, began by taking one-tenth of all that the producing classes made; this was increased, first to one-fifth, then to two-fifths and the whole social system broke down under the effort to make it three-fifths." At last the worm turned.

W. D. Howells once remarked that the severest indictment that could be formulated against America is that the average American would probably rather be Jay Gould, with all his crookedness, than James Russell Lowell. Assuming that there is, in many people, this terrible disease to get something for nothing, then it would seem that the duty of government is to discourage, rather than to encourage, such a spirit. Gladstone put it thus: "It is the duty of the government to make it difficult to do wrong and easy to do right." Has the American Government faithfully ensued that ideal? Beginning with the widespread graft of Grant's administration, coming down through an epoch whose dominating personalities were such men as M. A. Hanna, Nelson W. Aldrich, M. S. Quay, T. C. Platt, and so on *ad nauseam,* the conclusion is unescapable that *the government has thrown all its influence, in the past 60 years, to the building up of those special privileges whose sole purpose is to get something for nothing.* If the government had worked as hard to discourage the creation of these agencies as it did to encourage them, they never could have attained their present baneful and all but fatal supremacy. *If the Department of Justice had used the same vicious teeth in invading the offices and extracting the innermost secrets of the meat controllers and the oil crowd that it did in invading the offices of the pacifists in the late war, there never would have been a trust.* In every possible way, the three branches of the government threw the egis of their influence around the men who built up the monster combines that now throttle nearly every field of human activity. The government enabled Big Business to erect into a principle, a very religion, the system of GETTING SOMETHING FOR NOTHING.

Never before in the history of the world were so many agencies at work promising "something for nothing" and "getting way with it." But interest is at the bottom of all these major raids on the wealth produced by the workers. Interest on fictitious values or on public bonds—this is the hand that beckons high finance to its criminal carnival.

"Every man," said Emerson, "is a consumer and should be a producer." In strict justice no able-bodied person has the right to consume more than he produces: that in reality is stealing.

The happiest hunting ground of those who seek something for nothing is in the field of public debts. Here the "velvet" is so much in evidence that there is much reason to accept the opinion of those who hold that high finance promotes wars for the express purpose of securing more bonds. There is no escape from the burdens imposed by these debts on the citizen *except by emigration.* But even this is no longer of much use. Not without bitterness do those whose labors must pay all these debts, reflect that "while sportsmen have been able to obtain the reservation of many hundreds of square miles for wild beasts where these may not be disturbed by man, there will soon be not one inch of territory where the latter can escape the debt-contracting state."

To extirpate the parasite is the supreme problem of civilization. The problem is not so serious when the parasite is small but when the parasite is larger than its host the problem indeed becomes a very grave one.

The American Jewish Committee at Work

Concluded from page 8

ficer had earned during his short career. At the time of his death, his father, Major General Adelbert Cronkhite, was leading his division for the third time into the Meuse-Argonne offensive. He had been made a corps commander and awarded the Distinguished Service Medal by the President of the United States; had received the Cross of Knight Commander, St. Michael and St. George from the King of England, and the Cross, Commander of the Legion of Honor, from the President of France, as well as the Croix de Guerre, with Palms.

The Jewish *Tribune* asserts that for 40 years it has been America's leading Jewish family paper, and the forum of American Jewry. This claim may be too self-assertive, but it is partly borne out by the fact that it is supported in its advertisements by the leading Jewish mercantile firms in New York, and it contains contributions from Louis Marshall and other Jewish leaders.

On October 27, 1922, the Jewish *Tribune* published the following:

> AN AMERICAN DREYFUS CASE
>
> "General Cronkhite was actuated, I believe, by a desire to clear the military record of his son. I am told that on the tombstone above the grave of Major Cronkhite, in Arlington Cemetery, are chiseled the letters "S. I. W."—self-inflicted wound. In the army these letters have an ignominious meaning. Sometimes, on the eve of battle, soldiers commit suicide and "S. I. W." is put on their tombstone epitaph. Naturally, General Cronkhite wants these letters chiseled off his son's tombstone."

It is difficult, as yet, for the average American to fathom the peculiar malignity of the "Yiddish" mind. The above paragraph, aimed at an honorable American soldier and his son, has been circulated industriously by the Jewish press ever since Rosenbluth was arrested for the murder of his superior. In this instance, its printing was sponsored by Nehemiah Mosessohn, editor of the Jewish *Tribune,* alleged forum of American Jewry. He and his like have come to us as alleged fugitives from persecution, but their conduct may throw a light on the cause of the alleged "persecution."

Needless to say, *many well-meaning Jews have become alarmed by the attitude adopted by their racial press,* and one of these, Simon Wolf, in the American *Israelite,* expresses his confidence that "complete and satisfactory justice will be done in the Rosenbluth case," and he censures the Jewish *Tribune* for "having made broadcast statements which don't help the situation."

Colonel William Hayward, United States attorney for the Southern District of New York, in commenting recently on attacks made upon him and other Federal officials by Samuel Untermyer, was prompted to say: *"Mr. Untermyer would like to substitute himself for the Department of Justice, the Federal Judges, the Grand Jurors and the District Attorney, but this would be a dreadful place to live in if he did."*

But the actions of Mr. Untermyer, the activities of Louis Marshall and his associates, and the industrious propaganda of the Jewish press are all co-ordinated parts of a studied assault upon the native population of the country.

The peculiar psychology that prompts the campaign of the American Jewish Committee, and the astounding ambition fostered by its leaders will be dealt with in the next phase of the "Rosenbluth Case."

Conventions—Shuttles of National Influence

Pecuniary Benefits to Community Attracting Gatherings Are Great; Delegations Exchanging Ideas Aid in Maintaining Political Balance

By E. L. DIXON

Secretary and Treasurer, Detroit Convention and Tourists Bureau

CONVENTIONS are peculiarly American in custom and spirit. They have become an institutional factor—a part of the economic fabric of this country. Their influence, commercially, politically and educationally, has not yet been fully recognized.

Conventions of men in the same line of business signalize the fact that business has outlived the old idea that competitors must naturally be antagonistic in interests. In fact, the antithesis is presented by these assemblies of men in the same line of endeavor, getting together to formulate rules of procedure which shall govern all for the good of all. Mergers of interests are made possible by these gatherings. They are often the initiative of extensive organized undertakings of national interest.

Conventions maintain a balance politically. It has been declared that, had the convention spirit pervaded Russia in a fractional part that it does America, she would not have fallen into such extremes of disruption and revolution. These hosts centralizing periodically at important points are promoters of peace and progress. They are the covenant of substantial government. When one section of a great country of such diversified interests as this can come into contact with representatives from other sections, the inevitable interchange of points of view means a diffusion of understanding among the citizens of this Republic, counterbalancing provincialism and modifying insistent self-interest.

20,000 Organizations Meet

THAT they influence public opinion and legislation may be learned by reading reports of convention meetings, especially of the great religious gatherings and the leading women's organizations. The latter in particular have presented to Congress important measures, corrective and protective.

In nature, conventions may be classed as industrial, scientific, military, religious, fraternal, political, patriotic, commercial, financial, educational, vocational, professional, reformative and societies of the arts.

These international, national, state and interstate bodies number about 20.000, and meet semiannually, annually, biennially and triennially. The greater proportion meets annually.

The attendance of the greater proportion of conventions ranges from 300 to 2,000, in some instances numbering as high as 10 000.

Organizations, in the selection of meeting points, for the most part rotate from the extreme West to the extreme East; from the North to the South, varied by a few discursive visits to cities of the central states.

These convention bodies in the aggregate represent organized millions of persons. In that fact lies the significance and power of convention organizations. It emphasizes the widespread importance of the contact and interchange of knowledge which is the purpose of these gatherings. The organized forces are the controlling forces of the country. In one 12 months consider what intelligent direction has been communicated to these controlling forces, and has been made operative by them.

The convention creates for the community the highest form of advertising—the PERSONAL CONTACT reinforced by the favorable impression. Sir Charles F. Higham, of London, England, representative of Lord Northcliffe at the convention in Milwaukee, of the Advertising Clubs of the World, said: "The finest advertising in the world, as you all know, is word of mouth." The delegate to a convention is a representative citizen of the section from which he comes. His judgment is respected. His pilgrimage complete, he becomes a powerful medium of publicity in the locality to which he returns; a living advertisement of the place he has visited. Many of the American people have come to adopt the convention as a means of taking an annual trip or holiday, happily combining business with pleasure and education.

Bring Much Publicity

THE highest value of conventions to a community lies in their wide distributive power for publicity. Increase of population follows the advent of these assemblies.

As community developers these migrant bodies are unsurpassed. In point of civic production, they are of paramount importance to real estate corporations, banking institutions and those who have only professional services to sell, and must look for the development of their business through the development of their city. The delegate of today may be the settler of tomorrow. Many prominent merchants and manufacturers first came to the city as delegates to a convention.

The manufacturing interests are served by conventions. As an example of this, those in charge of procuring labor in Detroit have found that conventions are responsible for thousands of young men and women coming to that city.

It is claimed that the convention and tourist business of this country amounts to nearly $1.000 000 000 annually, and that it is yet in its infancy. It has become a giant industry, classified by the Bureau of Statistics at Washington as the fifth form of the nation's basic wealth.

It is not my purpose to enter into the tourist phase of this business, colorful though it may be, and dealing with the "great outdoors," which automotive development has made a feature of our recreation. I want to tell only of the business of selling a city, or community. It has become a systematized enterprise engaged in by all progressive centers. The pecuniary benefits to a community are of such proportions as to make the attracting of convention bodies the most popular business-getting idea there is today.

A writer of western tourist literature, referring to this business of selling objectives, in other words, attractive points, has facetiously described it as the only business in the world in which goods may be sold and delivered and at the same time retained. He says that they have been selling Pike's Peak for years, yet it remains the property of Colorado. Certain it is that few lines have as many satisfied purchasers who go away to boost for the seller.

It has been figured by convention secretaries that the average amount expended by convention delegates for maintenance and all incidentals may be conservatively figured at $15 a day. Some idea of what this amounts to in the aggregate may be obtained by taking the following for illustration:

During June, 1922, 45 conventions met in Detroit; two left more than $250,000, if we reckon their outlay at $15 a day.

In computing this we have taken cognizance only of the necessities of life and general incidentals. No account has has been taken of the man who knew he was to be a delegate, and waited until he was in Detroit to purchase an automobile; no account of the numberless orders left by those men for their varied lines of business, and no estimate made of the innumerable articles procured by these men and women to be either sent or taken home.

A convention secretary related to me the following little incident which serves to exemplify the uncertainty of the unknown quantity, which in this thesis is the spending capacity of the convention visitor. A man with his wife and two children came and asked him to find them a room for less than $3 a day. So, my friend found him a room at $1.75 a day and this was satisfactory. About a week later he happened to run into the gentleman. The secretary asked him how he had enjoyed himself and if he had spent any money.

How the Money Is Distributed

"WELL, I'm not quite sure of *all* we've spent, as my old lady handles the pocketbook, but I do know of $1,100 which we've spent in farm implements and things necessary for the house."

This is an instance of a very *conservative spender.*

Money in a community has an inverse and reverse action. The convention dollar is a shining example of the inverse action of money. The expenditure by conventionists for maintenance is the first DIRECT ASSET. Hotels are the plants—there could be no conventions without hotels—and to the superficial observer they are the only beneficiaries from the induction of outside money. In the operation of monetary diffusion they are only the clearing house for this initial convention outlay. They in turn must obtain supplies from purveyors of food and expend a great portion of this money for general replenishment and labor. The convention dollar travels through the veins of business and seeps into the remotest capillaries. In other words, this new money eventually benefits all—down to the humblest employe in the community. It creates employment and therefore increases the buying power of the earning classes.

In times of business depression when merchants are advertising to a restricted number of people whose buying power is entirely exhausted, or is temporarily restrained at the dictates of prudence and caution, the induction of outside money is like the transfusion of blood into depleted arteries.

Organized effort to secure conventions is a comparatively new line of activity. The bureau method of presenting the attractive features of a community to conventions in assembly has no competitor. Its distribution of attractive, illustrated literature among convention bodies in convention at different points throughout the country constitutes a form of advertising that cannot be approached by individuals.

In some cities convention bureaus are units of Chambers of Commerce, but in the majority of cities they are separate institutions incorporated not for pecuniary profit. Their officers are men connected with the various departments prominent in a city's municipal and commercial life who serve gratuitously.

Detroit Had First Bureau

DETROIT claims the distinction of having the first convention bureau organized in the United States. Noting the increase of sales and of bank deposits in consequence of the presence of conventions, fewer than a dozen men prominent in the city's affairs 25 years ago organized the bureau. These men were the first to conceive the idea of capitalizing conventions. They were "blazers of the trail" in civic advertising. Their success was so marked that Detroit soon became known all over America as the Convention City.

In point of service to the merchants of the city, the ramifications of the bureau extend to every state in the Union. Assistance of an organized nature is at the command of local business groups in getting cooperation and broadcasting propaganda.

There are some species of organized bodies wholly undesirable. Especially those who would replenish their exchequer for the ensuing year out of the hospitality of large communities. It is the function of the bureau diplomatically to regulate these predatory combinations.

The cost of conventions to cities comes under the observation of convention bureaus. For the past eight years convention secretaries have vigorously discouraged extravagant and lavish entertainment of delegate bodies. A code of ethics aiming to correct these abuses was adopted at the last convention of convention bureau secretaries, at which 28 cities were represented. They advocate the adoption of the registration fee as the solution of entertainment expense, and thousands of organizations are adopting this method of financing a convention. Aside from the pecuniary relief it affords the merchants, the 60-40 advertising solicitor is eliminated as well as the too frequent aftermaths embarrassing to local entertaining committees, resulting from solicitation and collection.

Through the functions and intervention of the bureaus, merchants are saved thousands of dollars annually, especially where this registration fee system can be introduced as the most equable way to finance entertainment expense.

By the adoption of this system the cost to cities of convention bodies is being rapidly minimized.

The bureau of a popular convention city, after figuring the cost of entertaining convention visitors and expenditure for operating expenses for 1921, reports that for every dollar paid out there was a return to the city of $120.

On Succumbing to an Attractive Label

Concluded from page 2

most important chapter of American history for Americans today. It prefigures their own battle. The issues of that time are the real issues today between true progressivism and the real reactionary forces—no matter what badges they may wear or what slogans they cry.

Jackson's fight was temporarily successful, but true progressivism in 1923 is certainly looking backward to what Jackson did. He destroyed class rule in finance, special privilege in credit. It came back. It is here today.

The later Greenback movement, the early phases of the Labor movement, especially its wonderful but forgotten efflorescence after the Civil War, and the other radical efforts of that time all reveal to the student of their history that they were shot through and through with the passionate purpose to RESTORE the conditions of the older America. Their leaders promised to bring back the Americanism, which had either vanished or was then slipping away from the common people.

The living core of these movements was the desire to re-establish the conditions of economic freedom and equality of opportunity which their partisans believed had existed in fuller measure in the earlier periods of the Republic, and which they declared were being destroyed by the growth of special privilege in protean forms.

The presidential campaign of 1896 marks the climax of the earlier types of protest and radicalism. Many diverse elements then crystallized about a financial formula, which it was believed would revive the life of the agrarian and home-owning democracy of the earlier Republic.

"The Dollar of Our Daddies" was the battle cry of that campaign that best tells its inspiration. The speeches and literature of the struggle reeked of history, of the Fathers, and sought to revive the ardor of the American Revolution by picturing international finance as a British conspiracy against America. The older America—land of free farmers, independent shopkeepers and artisans—was painted all over the horizon by the orators. In the mining camps and short-grass country of the West the bimetallic formula became an article of religion. At one time the silver movement was within a hair's breadth of success. It called forth from the financial power of the day a political effort in opposition, which revolutionized American politics. Mark Hanna is the father of modern political strategy and organization. Under him, political campaigns became national affairs managed by a real general staff. Before, they had been scattered state struggles. In the campaign of 1896 it was universally understood that international finance was involved. Lombard street and the Rothschild banking house were grilled on every hustings by the silverites. Despite the frenzied fringes on the free silver movement and the inadequacy of its formula, there was probably never a time in which the American people had a clearer comprehension of the processes and forces which have enslaved the greater part of modern industry to a parasitic money changing class, than in 1896.

Mr. Harper's article is being published in two parts. The second installment will appear in next week's issue.

BRIEFLY TOLD

There is no instrument that will indicate the presence of gold and silver or their ores. Iron attracts the "needle," but neither gold nor silver is magnetic.

Drugs secreted in barrels of fish were recently seized by customs officials on board a French steamship in Brooklyn. An automobile truck accidentally knocked over a barrel revealing part of the drugs which amounted to $100,000 in all. In Vancouver, British Columbia, while the police were searching a house in Chinatown for hidden drugs, a carrier pigeon flew in bearing a tube of narcotics.

The first act passed by an Irish Parliament in 122 years was a highly technical measure entitled, "Adaptation of Enactments Bill." It passed the Dail and was accepted by the Senate without discussion. At the time, Sir Thomas Esmonde, speaking with emotion, said, "We have done what many generations of Irishmen lost their lives in trying to be able to do, and may all thank God we have lived to see this day."

The man who opened up Australia to the gold hunters is dead. His name was David Lindsay, and one of his feats was to ride from north to south across Australia with only a small black boy as a companion. He discovered a great auriferous area and it was on the reports of his findings that prospectors went out and opened up the great gold-bearing field of West Australia.

A fountain of fresh water bubbles up through the salt water of the ocean some miles south of Cuba. This fresh water comes from springs that are fed from below the bed of the ocean. As fresh water is lighter than salt water, it rises.

One hundred and twenty Congregational churches in 27 states, use motion picture machines as an aid to the Sunday evening service.

An Indianapolis woman has pieced and quilted a quilt containing 30,888 red, white and blue pieces. It required five years to complete it. She values it at $1,000.

A Civil War bomb which had been tossed about for 57 years, used as an andiron and in shot-putting exercises, exploded recently wrecking a house on a plantation two miles south of Opelousas, Louisiana. At the time it exploded it was serving as an andiron, no one being in the house at the time. The house burned to the ground.

United States Treasury Notes and other currency will be printed by power instead of hand presses. More than 200 plate printers will be dismissed because of the improved method.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

It takes 60,000 rose blooms to produce an ounce of attar of roses, or rose oil. Great care must be taken to pick the freshly opened blooms while the dew is still on them and before the heat of the day has begun. The odor of the roses is volatile and the heat of the sun causes the blooms to lose their strength.

More than 2 000 deadly weapons taken from persons arrested in New York during the year were recently hauled to sea and dumped. They included more than 112 rifles, 1,500 pistols and an assortment of daggers, blackjacks, knives and slugs.

Motor vehicles of the Detroit post office have been equipped with a government device attached to the engine and so regulated that when the lawful speed limit is exceeded a seal is broken. The motors are inspected each night and if a seal is broken the driver is given a demerit mark. On the second offense he is dismissed from the service.

On Christmas Eve a 10-ton rock plunged down the mountain side through the little village of Duranus, France. It rolled through the tiny town at the rate of 100 miles an hour, demolishing houses in its path. It finally stopped in the dining room of a substantial dwelling. No one was injured.

In England, where law is law, the great Lord Salisbury was haled into court because he was employing an unlicensed chauffeur. He sought to explain to the court that he understood the chauffeur had a license. The judge said Salisbury had no right to assume anything. He promptly fined all hands and regretted that there was no authority to send anybody to jail.

The spirit of "O. Henry" is not dead. At the request of Sidney Porter's daughter, $50, received by her for a magazine story about her father, was distributed to the strays and derelicts in downtown New York's parks and lodging houses. Most of the money was given to guests of the Washington House and the Olive Tree Inn on Second avenue.

In 1844 two men arrived at the spot where Portland, Oregon, now stands. One man was from Boston and the other from Portland, Maine. Each wanted to name the place for his own home town and to settle the argument a penny was flipped. The Portland man won, according to the story. Pettygrove was his name and his descendants still treasure the historic penny.

Rarely a day passes that Mayor Shank, of Indianapolis, does not arrest someone for violation of a city ordinance.

Despite the vast amount of work before him and the long hours he spends each day in his office, Premier Mussolini, of Italy, finds time every morning to indulge in fencing, his favorite pastime. He is considered one of the best amateur swordsmen of Italy.

Cheap electricity for rural districts may be produced by harnessing the winds if plans of the British Ministry of Agriculture succeed. It is believed that low buildings, built on hilltops, could house the machinery and the huge wings would project from the sides of the buildings and be spun by the wind horizontally just above the ground. If successful, several generating stations will be built in out-of-the-way districts.

Some snow falls in each of the United States. The greatest fall occurs in the Sierra Nevada and Cascade mountains on the Pacific Coast, where it ranges from 30 to 40 feet in depth. At Summit, California, 60 feet has been recorded in a single season and 25 feet in a single month.

A new super-gun, invented by two Frenchmen, has no recoil, and is far more powerful than the German "Big Bertha." A brake acts in inverse direction to the recoil, neutralizing the shock. The same inventors have made an absolute smokeless powder and the flash from the discharge can also be concealed.

Wild geese throng the right of way of the Spokane-Portland Railway north of Wallula, Washington, interfering seriously with the operation of trains. When the flocks take wing before the trains the noise of their beating wings can be heard for great distances. They roost on the sand dunes, their webbed feet acting on the sliding sand as snowshoes act on snow.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

He Routs Bootleggers—They Go to Prison

What If All the 'Voters' Should Vote!

Producing Jewish "Martyrs" by Propaganda

CHRONICLER OF THE NEGLECTED TRUTH

What Would Occur If All "Voters" Should Vote

More American Votes Lie Dormant Than Are Ever Cast: Harding's Big Vote Eclipsed by Number of Votes Not Voted

THE real "silent vote" in this country is not composed of those persons who cast ballots and say nothing about it. It consists of those who might vote but don't—a virtual majority of the entire electorate as now Constitutionally defined. It has grown hugely in late years, despite vast increases in the total of votes cast in elections. It is giving to politics several aspects that confound the best political talent. One is that elections, no longer as of yore, throw long shadows into the future. Another is the possibility of this truly "silent vote" becoming aroused and exercising a power never before employed in elections.

By AARON HARDY ULM

IS THERE on or does there impend a "voters' strike" in the United States? Is the majority of American voters taking, toward the dominant parties and politicians, an attitude of "a plague on all your houses"? Has the plethora of extension, which for 60 years has governed constitutional and statutory treatment of the voting franchise, resulted in the very opposite of what was intended—the entrenchment of government by minorities?

A study of election returns during recent years would seem to yield affirmative answers to all those questions. This is true of the recent election, insofar as complete and general returns, in terms of popular votes, are now available for the country as a whole.

Despite the overturns in that election and the ponderous volumes of votes polled in many states only about one-third of all enfranchised Americans took the trouble to go to the polls and express themselves by ballot.

This was not unusual. It represents merely the continuance of a trend in evidence now for more than 20 years—a trend toward government—so far as carried on by the voters—by an absolute minority of those authorized to take part in conducting it.

Only 50 Per Cent Voted

LET'S take New York State as an example, for on November 7 there occurred in that state a surprising overturn. Former Governor "Al" Smith won by more than 400,000 majority. Yet he received only 150,000 more votes than were cast for him in 1920 when he was defeated. There were cast for both leading candidates for governor approximately 225,000 fewer votes than were received in that state by the two leading candidates for President in 1920. Yet in 1920 only a tiny fraction more than 50 per cent of all persons who might have voted in New York State went to the polls.

With respect to the Presidential election of 1920 the following statements of fact probably will be surprising to many persons:

1. Mr. Harding received the largest number of votes and the biggest popular majority ever given a candidate for office anywhere at any time.

2. *Yet only one out of every four persons possessing the voting franchise in 1920 cast ballots for Mr. Harding.*

3. **If all those who didn't vote in 1920 had gone to the polls and voted for John Smith or Sam Brown, either John or Sam would now be President.**

Likewise, if all the voters who didn't take part in the recent election had gone to the polls and cast their ballots concertedly for candidates not belonging to either of the major parties, Democratic and Republican caucuses during the life of the Sixty-eighth Congress might be held in the smallest room in the United States Capitol. If such had happened both the Democratic and Republican membership in the next House of Representatives wouldn't amount to more than 25 or 30.

This is a phase of politics which bewilders even the most masterful of the professional practitioners of the game. In recent years it has become so tremendous that election results mean very little as far as future prognostication goes. No one knows to what extent the 25 to 50 per cent of all possible voters who do vote comprise those who exercise the ballot in all or most elections. Nor can anyone tell when something will cause a substantial proportion of the others to go to the polls, or where, or how they will vote when they go.

Means Little in 1924

THIS is one of the reasons why the recent election resulted in many surprises. Even the most astute politicians knew that a fairly small vote would be polled. They didn't know to what extent it would be polled *by voters who took part in the 1920 election.* The only way they could "dope out" the result in advance was by assuming that the voters in 1922 would be persons who cast ballots in 1920. By a process of discounting for reactions and changes of opinion they knew that on that basis there would be overturns. And if the premise as to the personnel of the voters had been correct the overturns would have been limited probably to what the political forecasters expected. But a new factor entered, which was the casting of ballots in all probability by *many persons who took no part in the 1920 election.*

Thus the recent election presages little with regard to the Presidential election of 1924. For in the country as a whole there are something like *35,000,000 persons who did not vote on November 7 last* but who may vote in the next national election. Of course not all of them, not even one-half and possibly not one-eighth of them may vote two years hence. The number that will do so will be dependent largely on what happens during the intervening time. But one-eighth or one-sixteenth of them might play havoc with all the political houses of cards erected by the politicians.

This immense reserve of non-voters, representing a numerical strength greater than the fixed followings of both the major parties combined, is a new factor in modern politics.

It has never before existed in anything like its present proportions. In the early days of the country, when manhood suffrage was spreading, the votes polled in national elections were relatively small as compared with the possible. The Andrew Jackson campaign of 1828 really marked the beginning of large popular votes for President. The percentage of the possible cast in presidential elections steadily increased until 1896 when it reached something like 80. Twenty years ago it was not unusual for 85 to 95 per cent of all possible voters in some states and large cities to cast ballots in national as well as in other elections. Since then the percentage of possible voters that vote has been steadily falling. Of course, the total of votes cast has increased, on account of growth in population and also because of the extension of the suffrage to additional elements of the population. These have been so great that they have obscured the more vital phenomenon comprised in the growth of the non-voting habit among Americans.

A 100 per cent vote, of course, is virtually impossible. From 5 to 10 per cent of the voting population probably is debarred from voting in any specified election because of circumstances they cannot control. The shifting of population causes a million or so to be in the twilight zones of citizenship; that is, they haven't been at place of residence at the time long enough to permit them to register. Another million or so probably are away from home on election day. But about one-half the states permit these to vote by mail, if they wish to do so. Others, of course, are sick or prevented by business and personal exigencies from attending the polls. In most of the South the national elections usually are only perfunctory and naturally bring out only small votes.

On Increase for 20 Years

BUT after making all reasonably based discounts, the fact remains that from 25 to 50 per cent of all the unfranchised regularly remain away by more or less voluntary action from the polls on election days. And, as stated before, the percentage has been on the increase for 20 years and there is no positive indication of a change.

A tremendous increase in the number of non-voters was produced, just as increase was made in the number of actual voters, by the Nineteenth Amendment to the Federal Constitution. All the days that are available indicate beyond peradventure of doubt that generally women are worse offenders as to not voting than men, even in those states where women have had a generation or more of "training" as voters.

In only a few instances are separate figures as to the woman's vote as cast available but they leave little doubt as to the reluctance or indifference shown by the majority of those holding the franchise. In Illinois, where the votes are counted on sex division, only 47 per cent of all women who might have done so voted for President in 1920. About the same percentage voted in 1916. In that state in 1920, 74 per cent of all men who might have done so voted—a much higher percentage than the average even for northern states. In California only 47 per cent of the full possible vote, both male and female, was polled in 1920.

In Maryland only 33 per cent of the women potentially qualified to vote in the recent election registered. This was a smaller percentage than registered in 1920, the first year of equal suffrage there. There was a like falling off in the registration of men, and, of course, a large falling off in the total vote cast. In Baltimore City, for example, 194,484 registered. Yet in that city alone not fewer than 384,000 citizens of more than 21 years old were disclosed by the last census.

How "Doping" Is Impossible

FIGURES covering the recent election result in that state give a good illustration of how queerly the non-voting habit may confuse political trends. There a sitting Senator was defeated for re-election by a candidate who received 158,216 votes. Yet that candidate's party's candidate for President received in 1920 180,626 votes in Maryland and was defeated in that state by a majority of about 50,000.

Take the case of Indiana where two prime political surprises occurred this year—the nomination and the defeat of former Senator Beveridge. The nomination was taken as representing a notable overturn within the Republican party in Indiana, which may be true. Yet the total vote received by Beveridge in the primary election was only 25 per cent of that cast in Indiana for Harding in 1920. Harding carried that state by a big majority. Yet if the Indianians who remained at home in 1920 had gone to the polls and added their ballots to those actually cast for him there Cox would have won the state. Hence, as events proved, neither the Harding victory there in 1920 nor the Beveridge victory in the Republican primary of 1922 meant anything so far as later political events were concerned. And the two victories meant nothing, not necessarily because of changed opinion pending later balloting but possibly because of a substantial change in the personnel of the actual voters.

Similar and even more striking phenomena, than noted above, are disclosed by the election figures of most of the states.

They bear out, as applied to voting, the old saying that "you can take the horse to water but you can't make him drink."

For 25 years the extension of the voting franchise has been treated with extreme liberality. The woman's suffrage amendment, while by far the hugest, was not the only extension made. While the laws governing registration have been stiffened, essential qualifications for registration steadily have been lowered. In several states aliens, non-citizens, were granted the franchise. All that an immigrant from a foreign land into one of them need do, after the usual year's residence, is to declare an intention to become a citizen. This produced a singular condition during the war. In several states hundreds of "enemy aliens" who were kept under guard had full legal power to vote in elections.

Indifference, Disgust?

THE period also was notable for the subjects brought within the direct jurisdiction of the voters. All told it is probable that twice as many offices, throughout the country, are elective as were in 1890. The referendum also developed during the period. In one western state, the voter, in the recent election, was expected to pass on more than 200 different propositions, including candidacies. The ballot was about the size of a newspaper page. In that state, noted for its advanced and progressive citizenry, rarely ever do more than 50 per cent of all citizens primarily qualified to vote attend the polls.

The last 20 years also saw the development of the popular primary, to the extent of at least doubling the number of elections which take place.

Is it because of those things that voting has become the practice of a minority only? Do a majority of the voters refrain, as a rule, from voting because of the fact that too much is expected of them?

Or is the growth of the non-voting habit attributable to indifference—or disgust?

If one could answer those questions, it would not be difficult to forecast the future as to certain phases of politics—the continuance of the dominance exercised by the major political parties, for example.

So long as a majority of the electorate went to the polls in all important elections and necessarily, if not by preference, voted with one of the two big parties, a third party had little chance of becoming a first or second party. But with the majority of the voters uninured to the party habit—which is evidenced by the fact that the parties are unable to get them to vote with any degree of regularity—it is possible for a "third party" to spring up at any time and swamp both of the old parties. This could happen without any great number of voters being weaned from the old parties.

If They Did Vote, What?

FOR today there are not fewer than 55,000,000 persons primarily qualified to vote in these United States, while the largest vote that ever has been polled was the 26,000,000 cast in 1920.

Even if as large proportion as voted in the recent British elections went to the polls at one time in this country the total vote would be around 40,000,000. Incidentally, Lloyd George impeaches the result of the British election on the claim that only 6,500,000 votes out of the 15,000,000 cast went to the Bonar Law party. Yet that was a slightly larger percentage of the total voting strength of the United Kingdom than the tremendous vote received by President Harding in 1920 was of our full voting strength. In Britain about 70 per cent of the full voting strength was wielded; in this country, in 1920, there was exercised only about 50 per cent of the full voting strength, and in the recent national election probably not more than 40 per cent.

The non-voters partake very much of the quality of "silent voters," being, of course, negative in effect. No one knows how they would vote if once aroused and made positive. Nor does anyone know whether they can be aroused.

But the possibility produces a big political problem, one that so far has defied the highest political genius. If some leader, or some group, or some issue, should succeed in arousing this non-voting reserve in the American electorate and cause it to function cohesively and concertedly—well, "there would be nothing else to it." The result might be a political revolution such as has not occurred in America since the nation was established.

A Judge Who Is Routing Bootleggers

Simple Method He Employs Proves Effective—They Go to Prison

By EARL CHRISTMAS

JUDGE PAGE MORRIS was on the bench in the United States District Court in Minneapolis.

A hundred bootleggers awaiting sentence sat in the crowded courtroom, or, unable to get in, stood about with interested friends in anxious little groups in the corridors.

"Sixty days in the Hennepin County Jail, and $200 fine," said the judge at intervals, and the line kept moving up. Or, maybe, it was 90 days.

Presently, the marshal held up his hand.

"Your honor, the jail is filled," he said.

"How about the Ramsey County Jail?" asked the judge.

"Lots of room there, your honor," replied the marshal.

"All right, we will fill it," said the judge, and he promptly began to carry out his promise. He had sentenced some 30 men to the Ramsey County Jail, when the marshal held up his hand again.

"The Ramsey County Jail is filled, your honor," said the marshal.

"All right, we will proceed to fill the Wright County Jail," said his honor. "By the way, is that a good jail?"

Reassured, the judge filled the Wright County Jail, and then looked about for more worlds to conquer. He discovered the McLeod County Jail, and likewise filled it with bootleggers. Then he decided he had done enough for one day.

The next day he started in again. He filled the jail at Winona. In a few days more, he had filled the Wabasha and Scott County jails and started out to fill the Sibley County Jail. In one session of the Federal Court in Minneapolis and one session in St. Paul, he filled a dozen jails with violators of the prohibition laws.

Some of the jails, he filled several times. When there was a "vacancy" in one of them, he had a bootlegger to fill it.

"I have made up my mind that persons who sell liquor are going to jail," said the judge. "No getting away with fines. They are going to jail every time I can send them there. I am going to stop this liquor selling if I have to fill all the jails in Minnesota."

This unusual method of dealing with persons who violate the prohibition law naturally caused great consternation. Liquor sellers who had not been bothered much by fines were alarmed at the prospect of going to jail. Attorneys were hired and instructed to use their best efforts to induce the judge to listen to reason, but they argued in vain.

Threatening letters came through the mail, warning Judge Morris to stop sending men to jail for these offenses. At one time, it seemed advisable to assign a guard to prevent possible harm to the judge.

But despite these warnings that he did so at his own peril, Judge Morris continued sending offenders to jail for 30 and 60 and 90 days. In some cases, the jail sentences were as long as five months, and one old offender got nine months. In many cases, he sentenced the men to jail and fined them, too.

One man, who had been fined twice before in prohibition cases, came up before Judge Morris for sentence on his third offense. He was fined $400 and sent to Leavenworth Prison for a year and a day.

"I am going to stop this thing if I have to send every man of you to Leavenworth for a year," the judge said.

Several men who were convicted under a charge of conspiracy to violate the prohibition laws were fined $5,000 and given 18 months at Leavenworth, "so they would have enough time to reflect a little about the seriousness of violating the prohibition law."

Now, all this may sound a bit unusual when one is accustomed to seeing bootleggers get off with a small fine, say $100 or so, and continue their illicit trade at big profits. Judge Morris has unusual ideas about the enforcement of prohibition.

Why does he send men to jail for violating the prohibition laws?

"Jail sentences are the only thing that will stop this illicit trade in liquor," he said. "I began by imposing fines, but this failed.

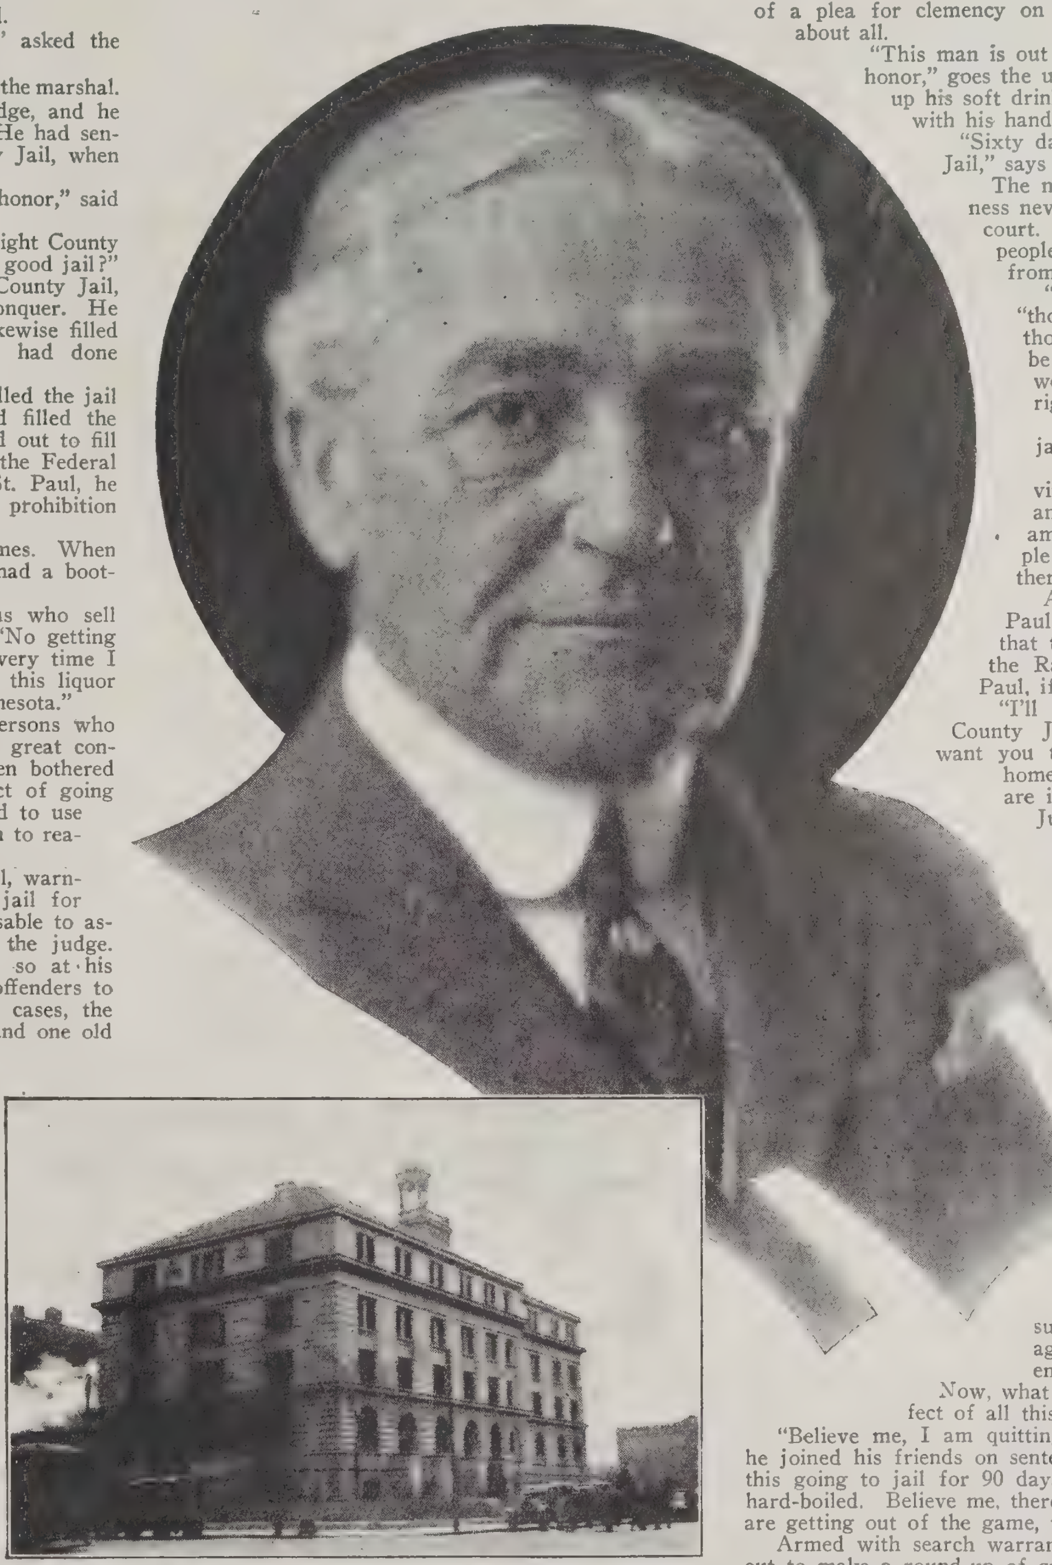
"Men were making big profits out of the liquor traffic and a fine meant little or nothing to them. But the humiliation of being sent to jail is the big thing. Even a short term is a greater deterrent than a big fine.

"I am convinced that jail sentences will stop the liquor traffic. If we don't get the desired effect, the penalties ought to be increased. That will put teeth in the law.

"Jail sentences may not stamp out violations of the prohibition laws right away, but they will tend to minimize them. The big return from strict enforcement after all will not be the immediate return. The big result will come in the next generation and in succeeding generations."

A year ago, Judge Morris warned bootleggers that he was going to give them stiff jail sentences in the future whenever he could. Not many took him seriously then. Even after he had sent a large number to jail at the June term of court in St. Paul, they were not convinced.

When court opened in Minneapolis in October, there were 320 liquor cases on the calendar. About half of the men accused pleaded guilty; the others prepared to fight. After a number of trials, all resulting in convictions, Judge Morris said something about men who tried to delay the course of justice when they knew they were guilty. Then he gave them jail sentences of from three to five months.



Above—JUDGE PAGE MORRIS, known in Minnesota as the terror of bootleggers. He has adopted a policy of sending men to jail whenever possible for violation of the prohibition law. Below—Several times Judge Morris has filled all available cells in this jail with bootleggers. In addition, he has filled a dozen other jails.

That caused a stampede among the bootleggers to change their pleas from "not guilty" to "guilty." Maybe, they would get off easier that way, the wise ones reasoned. From then on, the defense was demoralized. How could a bootlegger decide how to plead with a judge like that?

When the St. Paul session began, about half of the men accused told the judge they were not guilty. Then lawyers and clients began holding anxious conferences. When the time came for trial, virtually all the defendants walked meekly in and changed their pleas to guilty. In one week, 110 cases were disposed of, and not a man had the temerity to demand a trial. Of course, the chances didn't look overly bright for acquittals. Out of 320 cases at the Minneapolis session, there had not been one acquittal.

Judge Morris threw bombshell after bombshell into the camp of the bootleggers. In one day, he forfeited bonds of more than $40,000 when men did not think it sufficiently important to appear in court at the appointed time. He called for pleas on the presentation of the information or complaint, instead of waiting for the grand jury to return an indictment.

"The defendants have been in the wholesale liquor business and we will put them through the machinery of justice in wholesale fashion," he said.

Waiting for indictments was too slow. Attorneys for the bootleggers argued for the slower process, but Judge Morris held it was unnecessary to wait for indictments.

Really, with all their clients walking meekly up to the judge and admitting their guilt, attorneys handling prohibition cases before Judge Morris have little to do. Usually, they manage to get in a few words by way of a plea for clemency on sentence day, but that is about all.

"This man is out of the business now, your honor," goes the usual plea. "He has closed up his soft drink place, and gone to work with his hands. He won't——"

"Sixty days in the Winona County Jail," says the judge.

The next man comes up. Business never drags in Judge Morris' court. A defendant pleads that people insist on buying liquor from him.

"Yes," says the judge, "those who buy as well as those who sell liquor should be put in jail. If the law were that way, it would be right."

But the defendant goes to jail.

"I am not trying to be vindictive," says the judge, as another man moves up. "I am trying to keep these people from making fools of themselves."

A man who lives in St. Paul asks as a special favor that the judge sentence him to the Ramsey County Jail in St. Paul, if there is a vacancy there.

"I'll send you to the Winona County Jail," says the judge. "I want you to be in jail away from home, so you will feel like you are in jail."

Judge Morris is not arbitrary. If there are extenuating circumstances, he considers them in imposing sentences. But almost never does a man escape a jail sentence if the judge has the power to send him to jail. In cases where men are charged only with possession of liquor on first offense, he can do nothing but fine them. But second offenders and those who sell liquor, watch out!

"No more monkey business," he told one man. "As sure as you come back again, you're going to Leavenworth."

Now, what do you suppose is the effect of all this?

"Believe me, I am quitting," one offender said, as he joined his friends on sentence day. "I don't fancy this going to jail for 90 days. That bird certainly is hard-boiled. Believe me, there are a lot of others who are getting out of the game, too."

Armed with search warrants, prohibition agents set out to make a round-up of questionable soft drink establishments one day not long after Judge Morris began sending bootleggers to jail. On their tour, they found 18 soft drink places which had been closed. Having a glimpse of what was coming, their owners simply had closed up shop and left.

Wages for bartenders in soft drink places where liquor was sold jumped from $25 to $50 a week. The perils of the calling had become too great. One report was that bartenders generally were refusing to work in these places unless promised $10 a day for each day they had to spend in jail.

S. B. Qvale, prohibition director for Minnesota, said the effect was noticeable on the bootlegging business as soon as Judge Morris began giving jail sentences.

"Soft drink places began to close all over St. Paul and Minneapolis," he said. "It had a splendid moral effect. No man wants to go to jail. If he knows he is going to jail, he is going to quit selling liquor. The only way to talk to a bootlegger is through a jail sentence."

Judge Morris' attitude has attracted wide attention and commendation. He has received congratulations and letters of appreciation from all over the country because of his stand. Likewise, his course has been approved in Minnesota. Judges in the state district courts are beginning to adopt the same practice. Several state judges have announced that liquor law violators brought before them are going to jail. Women as well as men have been sent to jail. The day of petty fines for dry law violators is passing in Minnesota, it would appear.

To the President of Harvard

A WORD to President A. Lawrence Lowell, president of Harvard University:

The press reports you as denying a perfectly absurd statement attributed to you by an unnamed speaker in a New York synagogue. Of course you did not make the statement, and the man who charged you with it knew that you did not make it. The alleged statement, however, is not the matter here in question: your Jewish detractor is attempting to shake you out of the admirable composure with which you have thus far met the storm of Jewish propaganda. Falsehood publicly uttered is the least of the methods used; there will be a "whispering" campaign, and you may be prepared to hear yourself charged with almost any crime. Your fault before American Jewry is that you and the Harvard cabinet did not cringe before the manufactured assault made upon you and them when inventory was taken of the Harvard student body. It was a refreshing spectacle to see Harvard standing like a rock throughout that storm—Harvard which was being so brutally maligned by hosts of the very men whom she had taken under her broad and charitable mantle. Harvard knew no Jewish question, knows no Jewish question now, no racial prejudice of any kind. The Jews themselves know that. The crime of Harvard is that she will practice no sycophancy toward the Jews.

There's a Harvard Question in Jewry, no Jewish Question in Harvard.

Just a hint, Mr. President, if you will pardon it: don't bother with their accusations, don't give them the rise of a denial. THE DEARBORN INDEPENDENT has had a very wide experience in these matters and its counsel is not idly given. You had a courteous correspondence with a gentleman in Cleveland, which was trickily used against you. Speak to the people of the United States, but forbear answering the New York Jew, for his accusations are not like the accusations of other men, they are but the entry to a trap whose real purpose lies hidden in the inner darkness.

Copyrighting the Bible

STRONGER language than that used by the *Herald and Presbyter* would be justified, but that good paper contents itself with saying:

> "It is very humiliating, to say nothing else, to see on every one of the millions of Sabbath school lesson leaves that are sent out by our board of publication and Sabbath school work, besides in other lesson helps, the words: 'The quotations from the Standard American Edition of the Revised Bible, as printed above, are copyright, 1901, by Thomas Nelson and Sons, and are used by permission.'"

It almost passes comprehension how a publishing house could secure copyright to any version of the Scriptures, or why the authorized publication board of any church should care to use such a work in preference to its own Authorized Version, even if it were not, as the *Herald and Presbyter* charges, inferior. The *Presbyter* is correct in protesting against enjoying his Bible "by permission."

Who Are the Obstructionists Now?

IN A preliminary report the fact-finding commission, created for the purpose of finding a basis for a settlement of the coal problem, has failed to furnish anything not already known to the public, although mainly corroborative of the statements of the findings of the church and press investigators, who have placed the weight of blame on the mine owners for the difficulties between the miners and operators.

One action by the commission which, however, is not emphasized in the news dispatches, has stirred the representative press of the industry to praise or sharp criticism. It is the recommendation that the present truce between operators and miners be renewed for one year, or until April 1, 1924.

The independent coal press almost unanimously supports the commission in this, while those usually termed "organs" are a unit in calling on the operators to ignore the advice and reopen the struggle to force down wages this spring.

The operators themselves are inclined to a prolongation of peace for obvious reasons, but have a habit of listening to their advisers, whose services are expensive. It has cost their organization more than a hundred thousand dollars in the past year to maintain publicity service in Washington, with results hardly in keeping with that generous figure. To add to the embarrassment, membership in the operators' organizations is falling off, while the miners are gaining, which leads to conservatism inspired by discovery that the strike of 1922 was well financed.

The public, chief victim of the greed, is learning where to place the blame, and will hardly sustain the operators if they follow a course having for its object the benefit of a parasitic class which enjoys comfort and profit by stirring antagonisms.

The Power That Levels All

"UNCLE TOM" MULLEN, for the past 12 years chef at the St. Thomas Seminary in Denver, was buried from St. John's Roman Catholic Church in that city, December 22. The feature of the occasion was the honoring of the 85-year-old cook with the highest offices of the church, solemn requiem high mass being sung by Rt. Rev. J. Henry Tihen, Bishop of Denver, who, in the course of his sermon, said:

> "On this occasion the sacrifice offered, the vestments worn, and the atmosphere present are the same as for the so-called great. It is refreshing to know that somewhere there is a Power that levels all. A man is worth just so much as he serves his fellow men; position in the world is of no consequence in the sight of God."

The church was crowded by an appreciative congregation, while many prelates and priests from all parts of Colorado were in attendance. The only black person there, however, was the occupant of the coffin.

"Uncle Tom" was born in slavery, being freed during the Civil War. He had been a resident of Denver 15 years. The mass was the first in Colorado sung by a bishop at the funeral of a Negro.

Helping the Farmer

AT A recent get-together meeting of bankers and business men of the Upper Peninsula of Michigan, called to discuss the continuing depression, its causes and the possibility of effecting a cure, it was the consensus of opinion that if the distress of agriculture could be relieved the country would be prosperous. Among the prepared addresses on the program was one by W. W. Gasser, cashier of the Union National Bank of Marquette, in which he drove home some truths worth bearing in mind. To quote Mr. Gasser in part:

> "In view of the fact that between 50 and 60 per cent of the purchasing power of our country is invested in the rural communities, and inasmuch as prices which the farmer gets for his products are not in the proper relation with those he pays for his commodities, it seems that industry and commerce are being hampered by the loss of the farmer's purchasing power, and that one of two things must result—either the farmer must get better prices or the purchasing power of the country will be largely reduced. This, in turn, will cause another depression."

After canvassing the contributing causes for the admitted distress of agriculture, as advanced by other speakers, Mr. Gasser thus treats of the matter of credit:

> "My claim is that credit has very little to do with the farmer's present distress, *and that the giving of more credit would not help him out, but only get him in deeper.*"

That is sound sense. Most of the plans of farmer's credit consist in soothing his emergency distresses by getting him further into debt.

What the American farmer needs, first, is a way to get completely out of debt, and then a way to keep out of debt forever.

Debt and interest are crushing the world, and both will soon have to disappear through the sheer inability of the world to support them.

Gold Mining Unprofitable

THE *Mining Congress Journal*, published by that organization of owners of the mineral resources of the world, recites the claim that the price established by the United States is insufficient to permit a profit on the production of gold. Its logic would be more apparent were it not for the fact that the establishment of the price for gold establishes the value of the unit of a currency based upon it. In short, the changing of the price per ounce for minting purposes would cause a proportionate change in the value of the metal for coinage. This value cannot be expressed in dollars, since the dollar is the measure by which all values are expressed. The *Journal* premises its argument thus:

> "The sale of gold by the government at its pre-war production cost absolutely destroys the law of supply and demand as it relates to gold production and puts the government squarely into business as a competitor of the gold producer in supplying gold to those fields where gold is a commodity."

This premise will not bear analysis. In the first place, the price of gold never has borne a sustained relation to the cost of production. It is and always has been based on the relative value of gold and silver at a time when the price was fixed. The United States is not a buyer of gold, hence is not a seller, so in no way competes. Production costs vary with the fields where gold is found, and the revenue from by-product in mining. For example, in 1896, when the deep mines in Colorado estimated their bullion to cost nearly 80 cents to the dollar in coinage value, the Treadway mines in Alaska, where labor, transportation and other costs were much higher, were producers at less than 49 cents.

As to the destruction of the law of supply and demand, the claim that production is now unprofitable refutes it. The United States has decided the coinage value of gold to be $20.67 an ounce. It does not buy the metal, but coins it for the owner at that rate. If Great Britain, France or any other nation should offer a better price, no gold would be coined here. The fact is, there is approximately the same coinage value placed on gold throughout the world, and its commodity value is fixed by legal enactment into a stated number of units of money by each nation using gold.

Under bimetalism, even after other first-class nations had established the single gold standard, and the United States alone maintained the double standard, the relative market price of gold and silver was as 1 to 16. Today, with the same coinage ratio, under different conditions which permit it to affect only American silver, it takes about 30 ounces of silver to equal one of gold in the commodity market. In the past, ore with a $15 a ton gold content has been required for profitable production, and later $3 ore has been found worth reducing. The whole business is a matter of relative value.

The *Mining Congress Journal* demands the establishment of $36 an ounce as a basic coinage ratio. Does it not realize that production costs must by the same natural law advance in proportion? It must be remembered that gold is coined only on private account, that the government itself does not supply a market. If it has gold in its possession it is represented in currency circulation redeemable; it is storing for the owner.

No matter what the dollar standard in gold, the law establishing a ratio of bank reserve has more to do with disarranging the law of supply and demand so far as quantity of metal needed than anything else. By means of the lawful reserve required the metal in possession of banks of issue may be made to support an adequate currency, while the creation of bank credits, now doing nine-tenths of the business of the world, still further lessens the amount of gold needed.

This should be ample demonstration, not only that the remedy proposed would be futile, but that gold as a basis of real value is largely a creature of the imagination; that the basis of our medium of exchange is the credit of the country itself, and that gold is not essential.

A Fortune Gone to the Dogs

"THE More I Saw of People, the More I Thought of Dogs," is the inscription that will be carved over the door of what will probably be the largest animal hospital in the world, in accordance with the will of Mrs. Sidmon McHie, of New York. A great lover of dogs, it is claimed that her dogs are more perfectly trained than many children. For this reason, it is reported, Mrs. McHie has been often urged to direct her energies to the training of children. But in expending her fortune, she doesn't even go fifty-fifty with children.

When archeologists of future centuries excavate the ruins of present-day New York, this monumental hospital may prove illuminating in explaining some queer twists of twentieth-century civilization.

Mr. Ford's Page

PLEASANT prophets were always most popular. Especially among the feminine minded, or those born after their time. Fifty years ago was a pleasant time to live, it was a lovely sunset period between two days; and there are people who still yearn for that quiet and beautiful twilight. What is more, they will beam kindly upon the prophet who cheers them up by telling them that a return to the beautiful sunset is just before us, and that long years of tranquillity are dawning. For the other kind of prophet they have a fear, almost a distrust, and in some instances a violent dislike.

That may be the reason for the seeming rarity of true prophets, they are so seldom heard that they do not often speak, and the feeling gets abroad that they are very few and far between. Prophets who foresee what is coming, especially if the aspect of the future be austere, do not always tell it, or, if they do, they keep their telling for those who can understand. And those who understand are not at all the class we would naturally think them to be, certainly not the pillars of the system about to fall, certainly not those who have sold their souls to the god of things as they are. So that the true prophets are not as noisy as the others, and thus seem fewer and weaker; but they last longer. Of all the popular prophets, among whom and against whom Jeremiah appeared a weak and grotesque figure, we know not one; we know only Jeremiah whom few of his contemporaries knew or esteemed, and we know him because his prophecy was true, and his name lived on in it.

Even Jeremiah had a hopeful "if" as a part of his prophecy. IF the people would bethink themselves in time, abandon the political corruption and the financial practices that were surely throttling the nation, IF they would return to the sound constitution of their political life, then certain crises, certain consequences might be averted. There was, at one time in his career, still a chance for the nation to retrieve the lost position. But that time passed, and there was nothing for Jeremiah to do but to foretell the things that were coming and advise the people how best to conduct themselves under circumstances that could no longer be prevented.

Nobody, or at best very few, ever believe such a prophet, but it makes no difference in the main. The event falls just the same and the people always survive. That is a point overlooked—the people survive. It is one of the great delusions of the human mind that the superimposed systems of an artificial society constitute the basis of human life, and that if these fail, life is impossible.

THERE are two kinds of people, those who know that these times are full of deeper crisis than any other times have been, and those who live as they have always lived. These latter —they are not to be judged or despised, it is simply not their time to be called yet. Why wish them to bear the burden before their time? But those who see, let them beware that they be not misled. False prophets can deceive only those awake to the problem. The wakeful ones should see that what is passing was already past its service, that nothing that serves the common life can possibly pass away, and that the times are not "terrible" though they are critical, and will become more critical until all the useless social debris is cleared away.

Nothing could be more calculated to fill society with fear of progress. It is necessary to learn thoroughly the lesson that nothing passes away, nothing can be dethroned, nothing can be destroyed that is in any way serving life. Take any of the "systems" which have grown so great and regnant in our life, the financial system, the educational system, the political system, the ecclesiastical system —not one of them will disappear as long as they are serving life. But as soon as they become imperious and impertinent with the notion that they exist to be served, that they are the be-all and end-all of human life, it is a sign that their service is ended and their passing is near. And not all the denunciations of financiers or professors or clergymen or politicians can delay the passing by one hour. It is entirely out of their hands by the time that condition comes to pass.

That is the point of view which those whose souls have been sold to "systems" cannot get, and if they would recover their souls they must get it. It would relieve us of most of our fear and interpret to us the times in which we live, for from the old point of view of "system" things are going to grow worse and worse, while from the point of view of life they are going to grow better and better. We must make that differentiation.

Nothing is more futile than to attempt at this eleventh hour to save the things which have proved abler to ride the people than to serve them. Nothing is quite so stupid as to storm and rage and say that all this is caused by a sect of people known as "radicals." Why, all the radicals in the world could not do an iota of harm to the whole financial system if the financial system were of true service to society. Nor to the church. Nor to any other system. The fact that in Russia, where they "abolished money," they were compelled to come back to money, even to a ridiculous caricature of the present financial system, shows that there is a service being rendered humanity by the financial system. The criticism is that it might be rendering still greater and more equal service. It is a constructive, not a destructive criticism.

But what has been proved, in any system, to be a sore instead of a service, is going to disappear. And it is in process now. If we had a true sense of values we would be glad for it. Why anybody should plead for the continuance of the things that do not serve life, cannot be explained except by saying that they do not see.

Of course, many people do not see. They live in the world as under an inverted bowl, as the fish live in the sea. It is a comfortable way to live, and many wide-awake people have an itch to wake the others and make them unhappy too. Well, they try, but the others do not wake. Thousands of people in Paris never heard of Napoleon when he was at the heyday of his career. They knew that somewhere off in that bright sky of nationalism and government, there were strange things, but like happy babes in their cradles, they were not much impressed. People are going through the most shaking events in just that mood. They just accept it as the way things are. Lovers are meeting and mating even in Russia, just as the birds come in the spring, utterly oblivious to the things that are befalling the earth. Why not? Let them be. It is not their time to be called yet. But we, if we belong to those who have been called to be awake, let us not try to frighten the younger ones, and above all let us not be duped by our own false views of the terribleness of it all.

There is nothing "terrible" in the whole matter. If whole sections of our established systems are going to crash down, let them crash—they could not go unless they were rotten. Let them go! People are praying all over the world to stop the present dislocation and uncertainty, to restore things according to the 1914 pattern. Of course, their praying will not stop it, but that is not the worst of it—the worst thing is that they should so misinterpret the times as to make such prayers. A proper prayer would be, "Let this mighty inventory of righteousness go on and cease not until everything that lives by the unjust treatment of the people is cleared off the earth." How any other attitude can be even moral is hard to see.

But, whether those whose eyes are opened can be made to see correctly (false prophets are in vogue only among those who are capable of seeing) or whether the unseeing people can be made even dimly to understand, this much is certain, the moving judgment moves on and will not cease until it be complete. No cessation until the end. And the end will be a new beginning, with not one worthy achievement overthrown, not one true institution or system of service missing, but the old calculated selfishness gone, self-slain and unregretted even by those who temporarily profited by and defended them.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Vatican, Italy and World Politics

People Would Like to See the Pope in Streets of Rome

Observer in Italy Holds Union of Church and State Likely

By A. R. PINCI

AN OBSERVER could not have revisited Italy during the second half of the year 1922 and failed to perceive, in comparison to analogous impressions formed during a prior visit 10 or even 20 years before, an atmosphere of nationalism that approaches the phenomenal because it is the precursor of a definite union between Church and State.

Much, of course, has been said about the relationships between Church and State, especially by theocratic and monarchic preferentialists, but abandoning either the ultrareligious or ultrapolitical selfish aspects of this interesting question, an analysis is possible of a movement that is of unusual interest to democracies the world over. The analysis is possible today that was impossible six or seven years ago. To make it intelligible, one passing reference to the war must be included.

The war brought to chronological maturity the psychological moment when the Church could have tried to unmake, and successfully, the last half century of Italian history. The existence of this "moment" has passed quite unnoticed by official diarists and other writers of the period, yet its historical importance, not to mention its far-reaching consequences abroad, cannot be mistaken. Whatever confusion would have resulted from the Vatican's anti-State decision other war events would have effectively camouflaged.

Didn't Accept Opportunity

THE Vatican, however, refused to take advantage of the opportunity to execute that vaguely threatened project of restoring Rome to the papacy. In order to understand this fact in its fullest import one must take cognizance of the second war-time Pope—the late Benedict XV. As pontiff he was absolute, and this autocracy is exemplified by his success in offsetting the tremendous pressure exerted, especially at one time, to force the break. That he did not avail himself of the world war-born opportunity to establish the supremacy of the Church over the State—in Italy, of course—justifies the belief that such a step was not (and probably is not) conducive to an amelioration of the situation. The pontiff's attitude, on the contrary, had another effect, however indirect, which has led to the conviction that the Vatican suffered at the hands of propagandists, from whom less has been heard since then than ever before.

It is unchronicled personalia, this, but no executive or ruler of the period, in the war or out of it, faced and vanquished so much insurgency as did Pope Benedict. To be adamantine to this internal but not always ecclesiastical suggestiveness, and at the same time find the opportunity for spiritual statesmanship in the exchange of peace notes with President Wilson, brought into play atavistic qualities of the Genoese not unrelated to the geography of his birthplace, plus a certain secular experience gained in his early manhood.

In the absence of an autographic acknowledgment as to whether the late Pope intended to abandon or set aside the custom of voluntary exile the liberty of conjecture is restricted. Yet one point is of outstanding importance; that what was prescribed for Pope Benedict was denied to his predecessor, Pius X.

Roman official and ecclesiastical circles do not deny that Pope Pius was from the outset inclined to modify, if not to disregard outright, the pontifical rule of apostolic confinement, but that he was prevented from so doing through tactics inspired or initiated by Austria, France and Germany, whose governments were highly pleased with his election after Cardinal Rampolla's candidacy had been arbitrarily vetoed. Those three countries, by the way, played a great deal of politics in Rome, not always to their respective profit, but usually to the disadvantage of the Italians themselves. It is worth noting that the elimination of two since then, despite the attempted realignment of the other, has resulted in the improvement of Italy's internal situation.

Religion Has No Bearing

UNDERSTANDING the foregoing enables one to understand what follows. Religion having no real bearing or part in the problem known as the Church and State, or in the subjoined problem as between certain European governments and the Vatican, it forms no part of this article. But the facts are that before the State and the Church in Italy can reach an accord and possibly an alliance, foreign intrigue must be frustrated if not prevented. In other words, the distance between the Vatican and the Quirinal is within handshake, as it were, but there are too many other invisible hands that prevent the contact.

The worst of it is that all this is abominable and gratuitous political subterfuge. Religion has nothing to do with it. As to whether those countries that seem so determined to "restore" to the papacy its power—which does not necessarily mean that lost in 1870—are at the same time willing to have history repeat itself, and be made to feel anew the yoke of the Vatican's supremacy, no doubt need exist.

Many European sovereigns and peoples have at one time or another, through the course of centuries, quarreled with the popes. The Italians' single quarrel six decades ago has been different in that it was not directed against the papacy proper. The formation of the kingdom, based upon outlines designated by time long before Christianity appeared, left the new constituency no choice except to make of Rome their natural capital. This happened just as soon as foreign troops stopped interfering with a question that, except for a substituted diplomatic interference later, would undoubtedly have been settled long ago, to the satisfaction of Catholics and others the world over.

The Italians, one and all, love the Pope. The king, of course, is their political patron and accordingly elicits their outward applause and admiration, but the pontiff, irrespective of religion, to them symbolizes the one link that binds them to a distant and historic past in one continuous chain. The Pope, moreover, likes the Italians, and it is to be gravely doubted that any pontiff would care to resume his former Roman status, with or without foreign aid, merely to gratify vanity, pride or precedent.

Italian thought today practically deduces that Rome, having once mothered the then known world, could now extend asylum to two sovereigns without technicality and hairsplitting. Roughly speaking, the King of Italy can cross the peninsula at its widest latitudinal point and keep pace with the rising and setting sun, but the Pope as a sovereign can claim that the sun never sets on his empire.

For this reason the Italians would like to see the Pope in the streets of Rome. The intimacy of close ocular acquaintanceship would intensify their affection for him. The welcome that awaits him defies imagination; description is out of the question.

The Pope knows that. Pius XI knows it as well as Pius X or Benedict XV knew it. When the former appeared on the balcony overlooking Piazza San Pietro after the coronation ceremonies it was the first time a pontiff publicly exposed himself to the gaze of a crowd since 1870, when Pius IX drove across the city the evening of September 19, to Piazza San Giovanni in Laterano and the Scala Santa. He blessed the troops guarding a gate at that point. *"Venit summa dies et ineluctabile tempus."* The next day Pius IX began the self-imprisonment that continues to this day by the observance of his successors.

The Italians in general concede the logic of this act so far as it concerned its originator, who was overnight deprived of his civic sovereignty, so to speak, and they can understand Leo XIII's observance when the new kingdom was yet in its experimental stage. This act of protest would have stood either in good stead, so far as the proletariat was concerned, in case the new constitutional government might fail—a no improbable contingency in the face of the ups and downs from the time of Sterbini's patriotic chant, the Roman Marseillaise, until Napoleon III uttered his fatal "Jamais."

How Vatican Is Analyzed

IN APPRAISING the papacy and its problems, especially those of more or less recent origin, the Italian people have a way of doing it independently of whatever religious fervor actuates them. With them it is not a case of catholicism versus other religious affiliations. Sectarianism, as such, does not enter into it. For this they have ample precedent, brought about by slow evolution, of the Vatican itself. Heretical nations have not been extirpated by crusades, sovereigns have not been proscribed or deposed, nobles or other individuals have not been banned or excommunicated—the latter in the fullest sense of ancient force. On the contrary, certain popes have given evidence of adapting liberal thought to modern progress.

Take the most recent proof of this sort by Pope Pius XI in taking semiofficial cognizance of so American a holiday as Thanksgiving! Now, of course, it is a national day of observance, in which join all creeds and classes, yet it must not be forgotten that originally Thanksgiving was a Protestant custom. Compare the attitude of the Vatican against protestantism and its creations with the following pontifical declaration, in the audience chamber, addressed to the students of the American College in Rome:

"National Thanksgiving! It is a noble idea on the part of your people—choosing the day for prayer. Men who lack prayer lack one of the essentials of life. Your country must indeed be blessed by Almighty God.

"It is consoling to see the heads of nations fixing days for the people to pray to and thank God for blessings received. Nations doing this cannot but prosper materially and spiritually.

"I am with you, with your people, on the day of Thanksgiving. We are praying together."

I am with you, with your people, on the day of Thanksgiving. In the common cause of praying together Pope Pius obliterates historical traditions, religious distinctions. For this reason the occasion, as well as the sentiments expressed, rise above the realm of creed, and together may be regarded as precursors of impending changes. That they will be coincidental with government for the people by the people goes without saying. The Italians themselves are demonstrating this twinship of interest at this very moment.

The advent of Fascism in Italy was hailed, in certain Roman quarters not independent of foreign political influences, as the "deathblow" to the official reconciliation of Church and State. In fact, during the few weeks since Benito Mussolini formed his new government to the time of writing there have been rumors that Cardinal Gasparri, papal secretary of state, would resign immediately after the consistory of December and never again put his foot in the Vatican. Cardinal Gasparri has been dissatisfied with the events that eclipsed the Popular party.

The name Popular party, which carries such a comprehensively proletarian sound, was alleged to be the Catholic party, but in reality it included certain alien elements whose existence caused Pope Benedict to regard it with disfavor. Certain documents brought to light since the latter's death demonstrate the late pontiff's opposition against trick wording. This pontifical opposition was perpetuated in the person of Pope Pius, for the Vatican issued a circular to the *Unione Popolare Cattolica Italiana* to drop the word popular from its title.

The motive behind this, from the Vatican's standpoint, was to prevent misleading political intrigue under the egis of catholicism. Indications certainly point to the assurance that if catholicism and politics must cooperate, if not unite, it will be done under the respective direction of the Vatican and the Quirinal without middlemen. That is why Reverend Father Luigi Sturzo, Italy's priest-leader of a few months ago, guest and confidant of many of Europe's statesmen, has suddenly suffered eclipse together with the "Popular Party" of which he is the leader.

Last spring, especially at Genoa, during the international conference, it seemed as if Don Sturzo was the sole Italian representative there. At the time the foreign newspaper emphasized the fact that as the "Popular party represented the Vatican in the Chamber of Deputies," Don Sturzo consequently was the Vatican's official spokesman. Both assumptions were and are wrong. There is no doubt that Don Sturzo, whom the satire-loving Italians have made famous for his "long nose," is a man of the keenest intellect, and through his clerico-political affiliations swayed recent Italian ministries and their constituent members. But as for the people, they regarded him with some interest, mainly dramatic, but no more.

Mussolini Is Religious

THE action of the Vatican against the ambiguous denominational title of the party reorganized and led by Don Sturzo has merely served to alienate from the latter all of the former followers who, disunited, find themselves as weak as for a few brief months they were powerful. As Don Sturzo is credited with having vetoed Giolitti's return to power before Facta was selected, the aged statesman's admirers, of whom there are tens of thousands, have joined the anti-Sturzo movement. Don Luigi Sturzo, therefore, is now a past figure in Italian politics.

His elimination, however, has been without prejudice to the natural power and influence of the Catholic party proper. Premier Mussolini, credited once with being anti-clerical as well as anti-government, has gone further to prove that government in Italy cannot be successful except by co-operation of the ecclesiastical as well as constitutional forces.

He was very emphatic when he read out of politics all priests as such. They must be either politicians or priests; they cannot be both. In lieu of this he is reported as wanting at least two cardinals as members of the senate. It is not identical, but the illustration is applicable; what would have been the influence of the late Cardinal Gibbons as a Senator of the United States? Or of Cardinal O'Connell or Cardinal Dougherty in the Senate today?

A cardinal-senator is not an innovation, because there have been several of them since the establishment of parliamentary government in Italy, but all prior to 1870. As it is said that Pope Pius looks with favor upon the idea of beginning anew where the situation was broken off, in this respect, it looks as if politico-clerical ententes, intrigues, deals and the like, which have retarded internal pacification, will be rendered hereafter virtually impossible.

Demands' Solution, He Says

PREMIER MUSSOLINI evidently was aware of the obstructive or destructive force of dual influences that attempted to pit religion against government, and one of his important declarations on the subject served to remove the only prop from actual or potential agitators.

"I am religious," he said. "I think religion is the great fundamental moral force in the life of the people, and I am hostile to anything that savors of the atheistic or anti-clerical."

That statement by itself would easily pass for conciliative or conventional, but by resurrecting another statement made a year before one can get the right slant of meaning.

"The problem demanding most urgent solution is the problem of relations between the Church and State," Mussolini said in the Chamber. "For 20 years we, by reading Carducci's literature, have become imbued with the idea that the Vatican is a kind of old bloodthirsty wolf, but all this, though perhaps brilliant in literature, appears to us Fascisti as somewhat anachronistic in reality. I affirm that the Latin and imperial traditions of Rome are today represented by catholicism.

Dazzling Display in the House of Lords

Opening of Parliament by Royalty to Greet Conservative Government a Noteworthy Affair

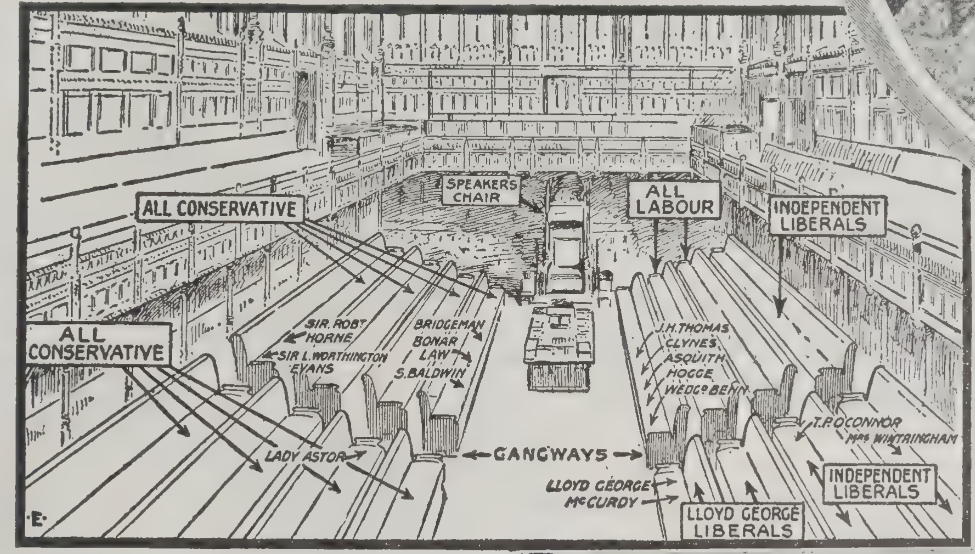
By PAUL TYNER

H. M. Queen Mary.

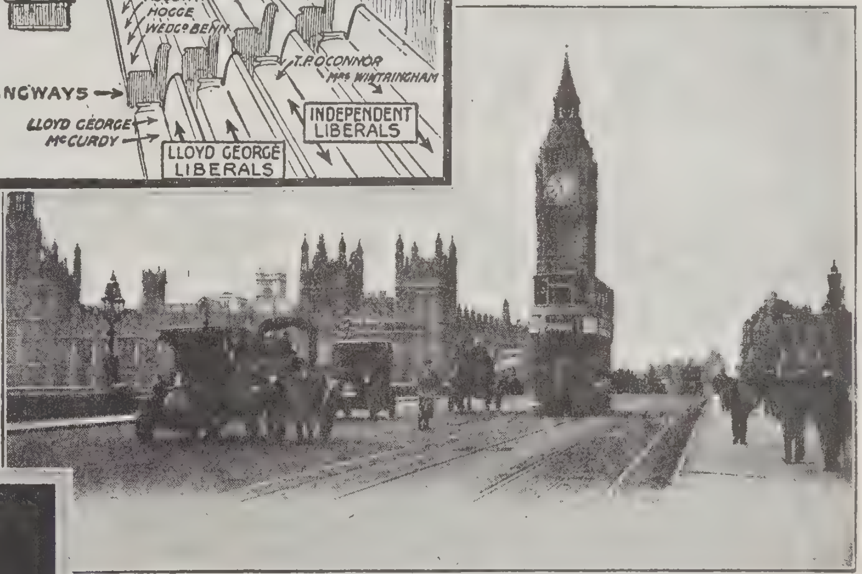
NOVEMBER 23, 1922, will go down in history as marking an epochal turning point in the history of England and probably of the world. I witnessed from a seat in the press gallery of the House of Lords the opening of the new Parliament by the king "in state." In this instance, "state" meant a display that would have done credit to the "Greatest Show on Earth" in Barnum's palmiest days.

Although I was there more than an hour before noon, the hour set for the ceremony, I found the historic chamber well filled. Its gilded and carved oak walls and ceilings and its stained glass windows, in which the places of saints in a cathedral are taken by putative kings and queens running back more than a thousand years and whose very names for the most part every one has forgotten, looked down on a brilliant scene. Not that it takes a very big crowd to fill this ornate chamber; it is not big enough to accommodate more than about one-tenth of the number of peers actually authorized to sit as arbiters of the destinies of the British people in Britain's storied senate. There were perhaps a half-hundred peers in their gorgeous crimson and ermine robes, the knights among them also displaying the jeweled collars of their respective orders—all this over ordinary evening dress in the middle of the day!

But gorgeous as were these peers, they were outnumbered and outshone by the peeresses, wearing diamond coronets and diamond and pearl or emerald necklaces and other jewelry. The cord of one of these gewgaws would have kept a workingman's family in comfort for several years. And the toilettes! I have not the society reporter's gift for description of feminine frippery, but the tissues and textiles that served to emphasize more or less artistic anatomical display, technically called *"décolleté"* ran the gamut of cloth of gold and cloth of silver, delicate greens and blues and pale petunia and chiffon velvets and other fleecy and fluffy things.



Above—The new House of Commons, *Daily Mail* sketch plan of the reconstructed House—London. On the left is the Treasury bench showing the Premier's seat. Facing this is the Opposition front bench, which Mr. Asquith's Party sought to share with Labour, the official Opposition. At right—Westminster Bridge.



As it is known that the wives of peers are only peeresses "by courtesy" and that not even "peeresses in their own right" are entitled to seats or votes in this aristocratic "Upper House," I was a bit puzzled until an English confrère informed me that this "opening of Parliament" was really regarded as a "social function." Perhaps a score of ornately gowned and coronetted and jeweled ladies looked with some envy, it seemed, on those lucky enough to have obtained seats on the floor.

As celebrities arrived there was much comment and craning of necks. The diplomatic gallery, particularly, was a center of interest. It was literally packed with personages in brilliant gold-laced uniforms, black and blue and red and green, many with scintillating jeweled orders and sashes covering their bosoms. But the American ambassador in a plain black claw-hammer suit, with "nary an order" or sash, stood out conspicuously among them.

Hark! There's a clatter of horses' feet on the asphalt without and a loud blare of trumpets, guns booming in salute in the distance and the chimes of St. Margaret Westminster pealing. At once a hush falls upon the brilliant assemblage and a nervous straightening up and falling into poses on the backless red benches. The young Duke of York had just been ushered to an end seat on the Bench of Dukes, his awkwardness in managing the voluminous folds of his ample crimson and ermine robe accented by the crowding together of more portly occupants to make room for his slight form. The lights are suddenly dimmed. And, in the dimness, the Prince of Wales has been quietly shown to his little throne on the right of the king's and below the dais. He seems weighed down and embarrassed by a voluminous red gown several sizes too big for him and by the collars and orders that bedecked neck and breast. But he is quite calm and dignified.

Another blare of trumpets, the lights suddenly blaze up again and everybody rises. Then the procession enters, two by two. It is a gallant and gaily colored line. First, "Rouge Cross Pursuivant" with "Rouge Dragon Pursuivant" in the heraldic dresses of the Middle Ages, dresses you see in old pictures and on "royal flushes." These high-sounding offices, it appears, are filled by plain "esquires" when off the stage, as are "Portcullis Pursuivant" and "Bluemantle Pursuivant" and a succession of Heralds, Maltravers, Lancaster, Windsor, Richmond, Chester and York. Then come the "Equerry to Her Majesty," Lieutenant Colonel F. Dugdale, and the "Groom in Waiting to His Majesty," Admiral H. H. Campbell; two Gentleman Ushers to His Majesty, Percy Armytage, Esq., and Colonel Lord William Cecil. They are followed by Equerries in Waiting, Crown Equerry, the Controller and the Treasurer of the King's Household, the Private Secretary and the Keeper of his Privy Purse, "Norroy King-of-Arms" and "Clarenceux King-of-Arms"; in gorgeous heraldic costumes these last two, although in reality untitled gentlemen and not kings at all.

A break in the line is caused by the Lord High Chancellor in his big gray wig and sumptuous robe walking alone. Big things are coming! The "Gentleman Usher of the Black Rod," Lieutenant General Sir William Pulteney; "Garter Principal King-of-Arms." Sir Henry F. Burke; the Deputy Earl Marshal, Viscount FitzAlan, who is really the stage manager of the whole show; The Lord Great Chamberlain, the Marquis of Lincolnshire. Finally came THE SWORD OF STATE, carried by the Marquis of Salisbury and THE CAP OF MAINTENANCE, borne on a cushion by the Duke of Devonshire, formerly Viceroy of Canada and now a member of Bonar Law's cabinet. The cap is a pretty round red velvet affair with a gold band around it. At last, in the words of the program, appear:

H. R. H. the Prince of Wales.

THE KING'S
MOST
EXCELLENT
MAJESTY
accompanied
by
HER MAJESTY
THE QUEEN

The pair halted a moment as they passed the portal separating the House from the Robing Room lobby and everybody bowed. Both majesties looked a bit pale and tired, but incontestably dignified and really royal. The royal crown on the king's head, with its sparkling diamonds, rubies and sapphires, seemed to add inches to his stature; but the queen, with her smaller crown of diamonds, her dress of cloth of gold flashing in the blaze of the electric illumination and the blue sash of the Order of the Garter giving a splash of color to her ropes of pearls and other jewels, towered above him, carrying herself like a Grenadier of the Guard. As they passed toward the throne, the Prince of Wales bowing especially low, it was perceived that the long trains of reddish purple trimmed with ermine were borne by two pairs of "pages of honor"; four boys in gay scarlet footmen's liveries heavily encorded and tasseled with gold.

Arrived before the dais on which the two thrones were waiting, center back, the king gave his hand to the queen assisting her up the three low steps, at the same time mounting himself. There they stood for a moment facing the assemblage and the tail of the procession went by, including the Woman of the Bedchamber, Lady Joan Verney, and the Lady of the Bedchamber, Lady Ampthill. These pretty ladies were followed by no less personages than the Rear Admiral of the United Kingdom, Admiral the Hon. Sir Edmund Fremantle, and the Gold Stick in Waiting, Field Marshal Earl Haig; the Air, Naval and General Aides-de-Camp, an Air Marshal, an Admiral and a General. Marching alone then came the Captain of the Yeomen of the Guard, Lord Hylton, "Silver Stick in Waiting," and several other court functionaries, also a group of Yeomen of the Guard in the quaint Elizabethan dress.

Then the king said: "I pray you, my Lords and Ladies, to be seated." And the king and queen seated themselves on the thrones. All the men, including the Prince of Wales, bowed again and the ladies did a neat old-fashioned curtsey. And there we all sat in solemn silence for five minutes waiting for Black Rod, who had gone over to the other side of the vast building to tell the House of Commons that the king was ready to receive them and to bring them up to the Bar of the House. Presently a loud knocking was heard, Black Rod in charge of Bonar Law and Ramsay Macdonald, Prime Minister and Leader of "His Majesty's Opposition" first and some 40 or 50 other members following, appeared at the Bar and announced that His Majesty's Commons were in attendance and waited his pleasure. The king and queen and all the rest of us rose and the Lord Great Chamberlain knelt on the steps of the throne and extended to the king a big roll of legal cap paper. The king then read the address in a clear bass, but very mechanical voice.

At the close of the reading, the king and queen bowed; we all bowed back and remained standing to watch the procession reform and go out.

Washington's Canal Idea That Went to Seed

Our First Inland Waterway, Along Potomac, Completed Only to Fail

By GEORGE H. DACY

THE greatest single work of development of the eighteenth century in this country, our first medium of easy transportation between the Atlantic Coast colonies and the Western Territory, a scheme which occupied much of the time and attention of George Washington many years before and again after he had served as President, never came up to early expectations other than being a historical stepping stone in American progress. At a time when public roads were as scarce as millionaires, when saddle horses furnished the most dependable transportation and when the settlement of the inland territories was impeded by impenetrable forests, unexplored districts and Indians anything but friendly and hospitable, a trader, Thomas Cresap, who had worked his way West as far as the beautiful bluffs overlooking the picturesque Potomac River, settled near a deserted Shawnee village and built a fortified home. Thereafter, Cresap made many trading trips among the friendly tribes farther West and became well acquainted with the land and flow of streams which linked the Virginia seaboard with the Ohio River Valley.

It was about 1740 that Cresap first conceived that easy communication between the English settlements on the Atlantic Coast and the country west of the Allegheny River could be effected. After much investigation, he finally journeyed to Yorktown where he interested men of money in his hobby and ultimately consummated the organization of the Ohio Company which thereafter developed into the most powerful of all pre-Revolutionary trading projects and which was the initial incorporated attempt to reach the great West. The company was chartered in 1748 and was granted a half million acres of land whereon it was to establish a fortified garrison of at least 100 families. About this time, George Washington was amusing himself surveying lots and fields in the neighborhood of Mount Vernon. His keen interest in surveying finally resulted in his accepting a position with the Ohio Company. Finally he was appointed surveyor-in-chief and remained with the trading company until 1750 when he received a commission in the army.

All that remains of George Washington's original canal on the Virginia side of the Potomac River. In its day this canal and its locks were the engineering marvel of the country. A depression 200 feet deep was blasted out of solid rock.

It was during those years that Washington became intimate with all the crooks and turns in the Upper Potomac in addition to making detailed excursions into the interior. He staunchly supported the plan to develop the inland waterways to promote migration to the country near and beyond the Ohio. The project to clear the channels of the Potomac River was first agitated about nine years after Washington entered the military service. This agitation culminated in the Pawtommack Company which operated from 1785 to 1828. Its purpose was to develop the transportation possibilities of the Potomac and other rivers which could be recruited by the use of connecting highways to form a satisfactory channel of communication and transportation between Ohio and Virginia. It is notable that George Washington subscribed $2,500 of the original $40,000 raised to promote this project.

Matters were at a standstill during the Revolutionary War and the scheme was dormant until several years after the Constitution was signed when the influence of General Washington procured the incorporation of the Pawtommack Company. During the war, Virginia had ceded to Maryland all jurisdiction over the Potomac River, reserving only the right of free navigation. Legislative action by these states was necessary to endorse the organization of the Pawtommack Company. Previous to this important event, George Washington spent six weeks in making a horseback trip of 680 miles inspecting the western country and investigating the prospects of water transportation and railroad development.

One of the service lock houses showing the hand wheels and chains which are used to raise and lower the lock gates and to drain or fill the locks.

Large Missouri mules furnish the motive power to haul the canal boats, each of which accommodates about 116 tons of soft coal.

Washington and his associates conceived a plan to render the Potomac River navigable by constructing locks and canals as detours around its impassable falls and rapids. They purposed to use the Potomac as a waterway to a point above Cumberland, Maryland, then known as Will's Creek, to build a national highway as a land link between this station and the mouth of the Cheat River and to join this river in a similar way with the Youghiogheny and Monongahela rivers. At that time there was not an engineer in the United States who had ever seen a canal lock or understood anything about the mechanical principles involved in such construction. But the same courage and daring which had lifted the yoke of England were evidenced in the solution. No public undertaking up to that time had aroused such enthusiasm and interest in the United States. Although the people were almost impoverished after the war and money was hard to get, some way or another the advocates of the waterways plan stinted and skimped and raised enough funds to start the Pawtommack Company on its colossal task. The best mechanician in Maryland accepted the position as chief engineer of the project.

For the next score of years, the work of the Pawtommack Company occupied the same attention in the mechanical world as did the Panama Canal in later years during its era of construction. The remarkable series of locks which were built around Great Falls was the engineering feat of the eighteenth century and was described in detail in scientific publications.

The development of the Potomac River was the nucleus of Washington's hope for national expansion, prosperity and unity. His activities in this particular work reveal him as a man of great imagination and enthusiasm. In a letter to Edmund Randolph dated August 13, 1785, Washington wrote, "The great object for the accomplishment of which I wish to see the inland nagivation of the rivers James and Potomac improved and extended is to connect the Western Territory with the Atlantic States; all others with me are secondary."

In a letter to Richard Henry Lee the same year, Washington wrote, "However singular the opinion may be, I cannot divest myself of it that the navigation of the Mississippi River at this time ought to be no object with us. On the contrary, until we have a little time open and make easy the ways between the Atlantic States and Western Territory, the obstruction had better remain. There is nothing which binds one country or one state to another but interest. Without this cement, the western inhabitants who more than probably will be composed, in a great degree, of foreigners, can have no predilection for us and a commercial connection is the only tie we can have."

Labor troubles and unfavorable weather handicapped construction activities on the canal and locks. The white laborers who were originally hired were unsatisfactory despite a bonus of a daily ration consisting of one pound of dried or salted meat or one and one-half pounds of fresh meat, one and one-half pounds of bread and three gills of rum. Finally, slaves were purchased to perform the work. The rainfall was unusually heavy and often the 40-foot rock which towers above the Potomac at Great Falls, 16 miles from the capital, was submerged. More money was needed for the work than was originally anticipated. Both Virginia and Maryland had to raise special appropriations on several occasions. Finally, Maryland adopted a lottery scheme to raise $300,000.

The principal canals were built at Great Falls and Little Falls. They were six feet deep and 25 feet wide, the river boats then in use being about seven to eight feet wide and 70 to 80 feet long. The locks were 14 by 100 feet in dimension with a lift of 10 feet. They held from 18,200 to 25,200 cubic feet of water apiece. A suspension bridge was also built at Great Falls over the Potomac River, the little settlement at that place then being called Matildaville. The cost of transporting a barrel of flour from Matildaville to Cumberland, 170 miles, was 15 cents while a charge of six cents a bushel was made for carrying corn on the river boats. In the year 1800, 296 boats of 1,630 tons were regularly using the new waterway but the toll charges for that year amounted to only $2,134. Eleven years later as many as 1,300 vessels plied the Potomac, their combined tonnage amounting to 16,350 tons but even then the toll revenue was but $22,542.

The decline of the Pawtommack Company began when the waterway was initially opened to navigation. The shipping and freightage were never sufficient to pay the maintenance expenses of the great work. However, the project was fruitful of progressive results in that it led to the building of the Chesapeake and Ohio Canal which, in turn, was the agency which was responsible for the construction of the Baltimore and Ohio Railroad, the first common carrier which penetrated what then were western wilds. The original canal locks around Great Falls, the first mechanical marvels made in America, which next to Mount Vernon were dearest of all to George Washington, today are marked only by ruins. Great crumbling walls of massive masonry and a huge opening 200 feet deep blasted out of the solid rock are monuments of a big idea that went to seed. Altogether they consist of five locks and a canal which was one mile in length. A descent of 76 feet was made by the boats which passed through the locks. Another canal two and one-half miles long featured three other locks with a descent of 37 feet.

With the failure of the Pawtommack Company, all attempts to utilize the natural river bed of the Potomac as a channel of traffic were abandoned. The Chesapeake and Ohio Canal Company took over the charter of its predecessor, being capitalized at $6,000,000, represented by 60,000 shares of stock. Originally, the project to build a barge canal from Georgetown to Cumberland had the support of Congress and the legislatures of Virginia and Maryland. The canal was laid out on the Maryland side of the Potomac River because natural conditions and the topography of the country were more favorable. It was the first big national undertaking to improve internal and domestic commerce. Baltimore, which at that time was one of the largest trade centers in the East, had made arrangements to tap the canal and extend it to that city which would have greatly augmented its commercial operations. The early surveys indicated that the canal would cost about $8,000,000, an enormous sum in those days. Later, more detailed investigations were made and it was ascertained that to build the canal properly and to extend it to Ohio would cost more than $20,000,000. The public immediately sensed that such a project was impossible. The citizens of Baltimore withdrew and centered their attentions on the development of the Baltimore and Ohio Railroad which they determined to groom as a rival of the canal. Thus the canal was responsible for the promotion and development of a common carrier which penetrated to the rich and fertile valleys of Ohio.

A group of canal boats docked for repairs at Cumberland, Maryland, the upper terminal of the C. & O. Canal. When operating at maximum capacity, about 350 canal boats are used.

A canal boat being lowered in one of the locks. There are 75 lift locks and two guard locks between Georgetown, D. C., and Cumberland, Md., 186 miles.

In some places the canal is tunneled through the mountains.

On July 4, 1828, the two most remarkable demonstrations held in the country up to that time took place in Baltimore and at Great Falls on the Maryland side of the Potomac River. The celebration at Baltimore was in honor of the commencement of work on the first long railroad in the United States. Charles Carroll, of Carrolltown, Maryland, the only surviving signer of the Declaration of Independence, delivered an inspiring address, and the entire day was devoted to merrymaking and joyous festivities. Washington was practically deserted that memorable day as, headed by President John Quincy Adams, everybody had gone to Great Falls to celebrate the beginning of work on the canal. President Adams, spade in hand, stood ready to shovel the first earth from the proposed canal. He prodded the spade into the soil and struck a root. Again he stuck the spade into the ground and hit another root. Then, throwing aside his coat, he went to work, cut away the roots and finally penetrated to the soil.

The difficulties that President Adams met with in digging the first shovel of dirt from the canal reflected the obstacles that the canal company was to encounter before the completion of the waterway. On 10 separate occasions, the company had to petition the Virginia and Maryland legislatures for more funds while Uncle Sam also aided the project financially. Finally, the Chesapeake and Ohio Canal was completed at a cost of $11,071,176, or $59,618.61 a mile. Unfortunately, due to the Baltimore and Ohio Railroad with which it had to compete, the canal was also representative of a big idea that went to seed. In 1843, its total revenues amounted to but $47,635, while its expenses for the year were $83,792. These figures were authentic barometers of what has happened since that period. The greatest single achievement of the C. & O. Canal, as it is commonly called, was to be the instrumentality that led to the construction of the Baltimore and Ohio Railroad which by 1842 was using 13 locomotives and a decade later had extended its tracks to Wheeling, West Virginia.

Several unusual occurrences took place in the development of the railroad. When it was started, locomotives were still in the experimental stages. One was operated by horse power, horses walking on endless belts inside of the locomotive to make its wheels move. Then Peter Cooper perfected the steam locomotive called "Tom Thumb." A curious race was held between the horse-driven locomotive and Cooper's steam locomotive and when the latter won, it was accepted as the official railroad engine of the new project. Previous to that time, a locomotive which operated by means of huge sails was used. The canal company fought many long and bitter legal battles with the railroad authorities before it conceded any of its right of way along the Potomac which was the natural outlet through the mountainous sections.

From 1850 to 1889, the history of the C. & O Canal was a history of the Democratic party in Maryland. The canal designed as a waterway which ultimately was to connect the Great Lakes with tidewater Virginia, developed into a channel of corruption and a political push ball to be buffeted this way and that with the swing of political sentiment. In every way, the canal was a financial failure and paid practically nothing to the holders of its debentures. It cost the state of Maryland millions of dollars and never yielded much of any income. If it had been conducted on an economical and businesslike basis, it might have developed profit but in the hands of the politicians it was abused and misused. Since 1848 the canal has been operated by a board of trustees or bondholders.

The Chesapeake and Ohio Canal has the most valuable charter rights of any waterway in the United States. All the potential development of water rights and power in the Potomac River is dependent on the will of the Chesapeake and Ohio Canal Company, for complete control of this water is vested in the project. It is one of the last of the old trading companies which were granted liberal charters. In 1870, this canal was handling more coal than any other waterway in the country and was making money, but political destiny ruled that its management should be changed so that the outgo again would be greater than the income. It has repeatedly been responsible for the ascendency and political power of different régimes that have dictated Maryland politics.

The canal is 186 miles in length and bridges a descent of 578 feet from Cumberland, Maryland, to Georgetown, D. C. It contains 75 lift locks, each of which are 14 by 100 feet in dimension and two guard locks. It can easily accommodate 350 canal boats—the capacity of the ordinary canal boat is 116 gross tons—sufficient to transport 1,000,000 tons of soft coal to market from the mines around Cumberland. This canal is an open carrier, a water highway for the use of any boat that will pay the toll charges. During the recent World War a considerable portion of the soft coal supply of the city of Washington came in over the canal. The indications are that this waterway will never be an important factor in the transportation of coal from the Maryland mines to seagoing ships, as the lower Potomac River is not easily navigable for large vessels engaged in the coal trade. It is probable that for years to come the C. & O. Canal will continue to be the punching bag for Maryland politicians.

The Vatican, Italy and World Politics

Concluded from page 6

I affirm that there is today in Rome only one ideal which makes a world-wide appeal, and it is the ideal which radiates from the Vatican."

Accepting the attitude of each side for what it appears, encouraging on the part of the Vatican, or, rather, of the Pope himself, and accommodating on the part of the state, it would seem as if an adjustment were inevitable. To say that it is would involve little optimism. Moreover, one thing is certain—that if the hoped-for conciliation is not the sequel of the existing situation then it may as well be set down as irremediable.

In theory, *conciliation* may not be the right noun, but in effect the problem is this: the minimum the Church may demand and the minimum the State may concede.

If one prefers, the word maximum may be freely substituted without affecting quantities. The final hope, perhaps, rests upon the interpretation of a declaration by Piux VII (required to go to Paris to crown Napoleon and in turn deprived by the latter of some apostolic authority through the *Articles organiques*) that the papacy might cede this or that part of its territorial dominions, but not abdicate its sovereignty. If the interpretation should be that Rome could be "ceded" to the State then the problem is as good as settled, because there is no question about sovereignty of pontifical nature.

Taken all in all, Pope Pius is revealing, if somewhat indirectly, a strong sympathetic tendency toward this solution.

He undoubtedly feels, as did his predecessor, that the Vatican's interests abroad have not only multiplied but also grown—and this growth actually makes anomalous the tenet of self-imprisonment. It would seem paradoxical, at least to the layman, that authority had been taken from the Holy See at the very time that its influence, even officially with foreign governments, is at its maximum. It is to be gravely doubted if the Vatican has at any time, even when master of the holy Roman empire, possessed undisputed and uncontested authority as is now the case.

In general, Pope Pius XI's attitude is non-geographical. To what an extent this means becoming blind, so to speak, to strictly Roman frontiers in favor of world frontiers, is problematical. Yet the tendency to participate in peace parleys to the extent of delineating desirable or necessary measures, and of being recognized in this respect by the foremost representatives of world powers, indicates that the Church is adding its democratizing influence toward a solution of existing difficulties.

But though the pontiff has his eye on every nation, it cannot be denied that his greatest admiration is for the United States. He never foregoes an opportunity to speak his praise—a praise that is not general, but specifically directed at some one or some thing American. Although some members of the Curia are irritated, for instance, by the activities in Rome of the Methodists, all from America, the Pope instead regards their efforts noncommittally. It would seem like exceeding the "carrying of coals to Newcastle" this carrying of religion to Rome, yet Pope Pius from certain windows of the Vatican may look upon Monte Mario, on the outskirts of the city, where the Methodists are planning to erect many buildings for their use.

Moreover, the Italians themselves have become accustomed to American churches in their midst. As to whether these can win many converts one can deduce from the following statistics, which show that there are more atheists in Italy, per thousand of population, than all religions put together, Catholics excluded. The ratio is as follows:

Catholics, 951.3; atheists, 25.2; undeclared, 18.8; Protestants, 3.6; Jews, 1., and other cults, 0.1.

The most important declaration has been reserved for last place. It is that the solution of the Church and State question of Italy, however remotely identified it may seem, will prove a powerful lever for the adjustment of many existing international problems.

What Will Our "Liberals" Say on Credit?

It Will Be Interesting to Watch the Antics of Publications Whose Paper Bills Are Paid by the International Loan Sharks

By LEWIS HARPER

This is the second and concluding installment of Mr. Harper's story, the first part of which appeared in last week's issue.

THE present political trend is strikingly reminiscent of the upheaval which followed the Hanna era, the beginning of which was signalized by the publication of Tom Lawson's "Frenzied Finance" and the insurgency against "Cannonism" in the National House.

The looking backward tendency is observable in this movement, but not to the extent that marked previous progressive uprisings. The literature of the muck rake, which preceded the strictly Rooseveltian phase of the insurrection, is permeated with well-written contrasts between the evil conditions portrayed by its writers and the happier status of the primitive American democracy. But the line of remedies popular with the progressives of the Roosevelt-Taft period was strikingly different from those in favor with previous reformers. The later movement constantly shied away from the problem of finance—the Pujo Money Trust investigation being the only notable exception. Solutions for public ills were sought most fervidly in amendment or repair of the political machinery of the nation and states, such as the Initiative, Referendum and Recall. On these purely political proposals the varied factions of the movement could unite. In other directions there was marked economic timidity—or else a movement toward state socialism. This usually went no further than the phase of regimentation. "Regulation" and "commissions" were the "blessed words" in those days, and the bureaucracy and mandarinism that now affright us, got their great impetus at that time—to be later accelerated manyfold by the war.

We now realize that the political repairs and tinkering that were articles of faith in 1912 have evolved, where put into practice, into mere supplementary political mechanisms to be operated by very human voters—the same voters who failed to protect their interests with the probably sufficient machinery that already existed.

Alienizing American Thought

THE numerous progeny of the commission idea have settled down into bureaus for registering the dominant economic necessities of the moment. Mostly they serve only to wrap in red tape results that are industrially inevitable. Some of the enthusiasts for regulation have taken the next step and become advocates of government ownership and operation, but the failure of bureaucratic regulation and the colossal miscarriages of government business in the war have probably turned a greater number in the opposite direction. This is a guess however—the march to state socialism has now been renewed, for reasons we shall presently examine.

The movement culminated in the election of 1912 when the New Freedom was achieved.

It is not hard to trace the reasons why the impulse that elected Woodrow Wilson was so different in its search for political remedies from its predecessors. The same reasons apply to the confusion as to remedies that marks the present progressive urge.

By 1904 international finance had become firmly rooted throughout America—not only in industry and politics, but its cognate cults were beginning to sway the press, schools and pulpit.

American industry was becoming syndicated and Europeanized at the same time. Alien powers, systems and methods were getting control. American thought was being alienized. The communism of pelf, as Cleveland aptly dubbed the new tendencies in banking and industry, was marching side by side with the political and social cults, which are the intellectual co-ordinates of international finance and spring from the same racial sources. Socialism below is only a reflex of Special Privilege above.

By the time the new forces in business and politics were blossoming into power, the fiber of the American stock had been profoundly damaged by the dysgenic effects of modern city life and the relative depopulation of the country districts. This had coincided with a deluge of alien racial stocks, then sweeping through New York harbor at the rate of a million or more a year.

Building the Slum Power

THESE hordes emptying into the unprepared Republic from the steerage were building up the slum power in politics and trade. The ramifications of the slum power today have spread into journalism, literature and the theater until Americans no longer feel at home in those fields. Americans still dominate the newspapers, and have a diminishing hold in literature, but they no longer employ American methods in either. The newer slum remains a slum in standards, no matter how much it may become veneered with wealth or outer cultural trappings. Before 1880, immigrants landed poor, but whether they remained poor or became rich, they all became Americans. Today they may still achieve wealth but they do not become Americans. What wonder then that the progressive movement which culminated in the New Freedom of 1912 produced as its most concrete achievement the FEDERAL RESERVE SYSTEM—the very antithesis of the American financial idea—state socialism in credit—special privilege at the throttle of the whole industrial system!

Could a more grotesque result have been fashioned in the wildest nightmare—the triumph of a "progressive" movement taking form in the enactment of a variant of the Aldrich bill—the very system that the Special Privilege had conceived but been unable to achieve when its ostensible servants, the "Old Guard," were in power?

Such had become the potency of labels by 1913 that it was possible to enact into law this subversion of everything that American progressives had always fought for, and have the people swallow it as a "progressive" measure.

Exactly this situation now confronts us. We have a progressive movement, but it remains to be seen whether it will develop on real progressive lines—BACK TO AMERICAN DEMOCRACY—or whether it will be manipulated by the tricks of mass psychology into the avenues of decay. Retrogression not progress confronts this nation if it follows the lead of international finance and its "kept liberals" who are making desperate efforts to captain the new movement.

Yet the way is plain. The path of progress is marked out by a very simple issue, and the stand of any man or group on that question provides an all-sufficient test as to whether that man or group is a real progressive or is wearing a progressive label from a counterfeiter's shop.

That issue is finance. The statesman or party that favors a financial system based primarily on production is moving in the progressive orbit, those who favor the system now operated by a handful of international bankers are reactionary, no matter what ribbons they pin on their coats.

It is easy to analyze the results of the last election in this light. There have been many genuine progressive victories. In every such case the credit system was a prominent issue in the contest and in those instances there is no room for doubt as to what the result means. There were other contests in which this or that "progressive" or "reactionary" was elected, but beyond the labels involved, the results mean nothing or perhaps add a positive element of confusion to the situation.

It will be interesting to watch the maneuvers of our "kept liberals" when the line-up on the credit question begins to take sharp form. Then indeed will this study of political labels have significance. On the issue of financial control there are all-compelling economic and temperamental reasons why some of our best known "liberal" publicists will be found ranged with the international loan sharks. They simply must. They are bone of their bone and flesh of their flesh. It will be an excruciating experience for some of these folk to find themselves regarded as "Tories." Many of them would prefer almost any other humiliation to that. Their usual haste to espouse any new cult that appears in the scum on the top of the Melting Pot, to avoid even the appearance of conservatism, is an index of their dread of the epithet "reactionary." But this horrid thing seems inevitable for some of our very nicest liberals. It is almost pitiable, no matter how amusing, to picture some of our journals of weekly mutual admiration openly lined up with the sordid interests of the financial ladies and gentlemen who keep them—for purposes that are now beginning to be revealed.

Wall Street and Strikes

AND we are learning a lot nowadays about the various lanes that turn into Wall Street if followed far enough. Who would have believed a few months ago that Wall Street banks finance strikes. THE DEARBORN INDEPENDENT has been laughed at for even hinting such a thing, but recently labor "leaders" admitted they borrowed hundreds of thousands of dollars for that purpose within sound of Trinity chimes. And the bank asked for no collateral.

It will be necessary for the people who elect progressives to watch them carefully while they are in Washington. It is an old story how American radicals elected out on the plains or up in the mountains change color after a bit of Congressional service. A relapse into hard-boiled Toryism presents nothing new or puzzling. It is as natural for men to become conservative as it is for them to grow old—the two things are parts of the same physiological process. It is nothing to worry about as a rule. We have to have Tories. The Anglo-Saxon race owes much to its Tories, who are usually dynamic, not static. Tories are responsible for the territorial extension of the race and for its commercial dominance in the Tropics and Far East. It has always been a bit queer how Tories have gone out from England and conquered business for the anti-imperialistic liberals of Manchester, who would starve without the imperialism they denounce. The Tory usually offsets stagnation at home by activity abroad. When an American constituency sees its progressive representative graduate into Toryism, it can replace him, but it need not feel very badly about it. The change that should occasion concern now, however, is the well-marked tendency of progressively labeled Senators and Representatives, after a season on the Potomac, to abandon the virile progressivism of agrarian America for the futile and decadent "liberalism" of New York's tenderloin and East Side.

Several promising men are now in Washington backed by majorities that carried a mandate to reform the credit system—to attack the citadel of the loan barons, whose journalistic valets and butlers constitute the élite of eastern "liberalism." More will be there when the newly elected Congress convenes.

It will be interesting, indeed, to observe what these men do in Washington. Subtle blandishments await them—flattery of a most insinuating sort—some of it from the social lobby—some from the pink-shaded tea tables of the manicured "intelligentsia."

If they yield to these influences it ought to be easy for their constituents to detect it. They are already familiar with the symptoms when a progressive is turning Tory. One of the indications that a statesman is turning pink, is an increasing forgetfulness about the mortgages on American farms and a deepening anxiety about the recognition of "Soviet Russia," or other "sweet lands across the sea."

Industry and Finance

INTERNATIONAL finance and its agents, whether black or pink, *are* confronted with a factor that they cannot well counter. That is the increasing knowledge of the people as to the real functions of credit. The people are rapidly grasping the fact that FINANCE and productive INDUSTRY are not identical. They are beginning to see how FINANCE CAPITAL seeks to devour or control INDUSTRIAL CAPITAL. In some sections of the country it is no longer a secret that FINANCE CAPITAL has no scruples about allying itself with any disruptive element or promoting any destructive cult to harness and break down industrial capital and its management to obtain control and place such industries under tribute. This explains why international financiers subsidize all sorts of alleged "radical" propagandas, which specialize in heckling industries not controlled by the financial ring, but carefully refrain from discussing commercial undertakings which are dominated by people more to their liking. The strange affinity between syndicalist agitators and certain types of business men has often puzzled old-line American labor leaders. Out West metal mine operators who have been well-nigh ruined by the I. W. W. have been wondering for a long time whether the depreciation of their property through sabotage from below has any relation to what they consider sabotage from above, when they scrutinize certain maneuvers of the smelting rings. Operators and men in some camps long ago buried their old feuds to unite against these insidious influences. In many a canyon you will find the operators' association and the remnants of the metal miners' union fighting together a losing battle against forces which proclaim mutual hostility but whose actions are marked by marvelous coincidences.

The people are learning much and will learn more. Eventually they will understand that FINANCE CAPITAL, being essentially ignorant of productive activities and their necessary conditions, is not only willing but eager to flirt with schemes like state socialism or "industrial democracy," in the effort to work out some method by which it could control and milk industry without having to assume the task of management for which it is unfit.

The "industrial democracy" formula is a cunning talisman employed in the game of mass suggestion. It is a compelling phrase, until ripped open. Then it turns out to be syndicalism, nothing more—merely the old effort to eliminate efficient executive control from the bread-and-butter effort of mankind, the old effort to dispense with discipline and brains.

As long as fools are bred, this effort will continue to plague the world's workers and producers.

To understand all these involved relations it is necessary to grip firmly the underlying intellectual kinship of the big loan sharks, who are the outer parasites on modern civilization, and the "lesser breeds" beneath; who have undermined all former civilizations and are boring within modern society. The latter, who sometimes assume the rôle of "critics of western civilization" represent either alien strains, naturally hostile to the individualist traditions of America, or come from exhausted and decadent American stocks.

Decadent Tendencies

THE native type gratify their inferiority complexes—to borrow a bit of the Freudian cant so popular with them, despite its unpleasant implications to themselves—by posing as social revolutionaries, fired by sympathy with the under dog, or spend their time in bewailing the "limitations" set upon their "genius" and self-expression by the American "bourgeoisie."

Defective or diseased individuals are nurtured and preserved in civilized societies—often at public expense. Unable to keep the pace demanded by its life and moral standards, they often seek to destroy the civilization made hateful to them by their inferiority, or to deceive themselves as to their real relation to it by inverting social, economic and moral standards.

As our civilization ages we will have more rather than less of this sort of thing. It is bound up with certain decadent tendencies in art, morals and industry that have always appeared in similar periods and are with us once again. As American civilization is unusually strenuous and calls for a high degree of individual responsibility, it develops as a waste product a great many such parasites to annoy it.

Our abundant crop of this type today finds in the

33,000 Tons of Metal Going Into a Bridge

World's Longest Suspension Construction Will Span the Delaware River

By WILLIAM A. M'GARRY

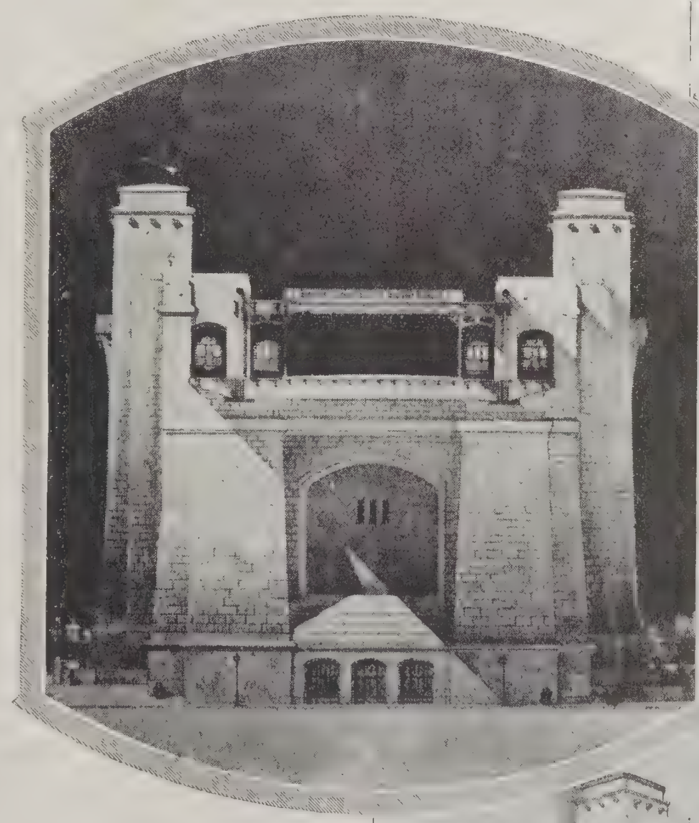
IN LESS than four years motorists making their way to the great national playgrounds on the New Jersey coast will be able to avoid the tedious wait now often experienced at Philadelphia by rolling across one of the world's longest suspension bridges. Work was started on the structure only a year ago, and by spring the slender, 380-foot steel towers will begin to rise on either side of the Delaware. From an engineering point of view, the most difficult feature of the structure has been nearly completed, although there is as yet nothing to show above water, save the barges carrying materials, and the tops of the caissons in which the "sand hogs" work in the construction of the foundations.

Camden terminus of the Delaware River bridge.

The visible part of the task—the building of the towers and the spinning of the two huge cables that are to carry the tremendous weight of the bridge—will be far more spectacular to spectators, but not nearly so dangerous and thrilling to the workers as the things that must be done below water level, even below the level of the river bottom, all the way down to bed rock. There men must work under such heavy atmospheric pressures that a great deal of the time for which they are paid is spent in going to and coming from work in the elaborate system of air locks used to accustom them to changes of pressure.

A caisson is nothing more nor less than a huge box, with no bottom, divided into two sections. It is built on a shipway of timber with steel bracing and floated to the point where it is to be sunk. Then concrete is poured into the top section, thus forcing it down into the water. That process is continued until the box stops sinking. Then the sand hogs get to work. Far down in the concrete of the top section is a chamber, or lock, entered by means of a shaft in which ladders are set. Another shaft from the chamber leads down into the bottom section. When the workers get there they find a certain quantity of air, just as air stays in a glass that is turned upside down and thrust into a pan of water. More air is pumped in from above to force out the water, so that the workers can get to the mud of the river bottom.

Working at first in shifts of four hours, the sand hogs shovel the mud into buckets passing through another shaft. Extraordinary care is necessary to keep the air pressure in the chamber where they are at work equal to the pressure of the water filtering through the mud from the outside. In that connection a close watch is kept for leaks. A supply of sand bags is kept on hand. When the foreman or one of the workmen notices a trickle of water entering, a bag of sand is thrown against the wall of the caisson at that point, just where it rests on the mud. Meantime more concrete is being poured into the top section, thus adding to the weight and slowly forcing the caisson toward bed rock.



View of massive anchorage from street.

The deeper the caisson, of course, the greater the air pressure. At the lowest levels men can work for only 45 minutes at a stretch. They must spend an hour or more in the lock above, where the pressure is slowly decreased. Occasionally, even with the greatest precaution, a man leaves the last chamber before his system has became accustomed to the lessened pressure. Then he gets what is known as "the bends." In reality it is air in the system. He may walk some distance away and then suddenly stagger as though intoxicated and collapse. The only known treatment is to rush him to the hospital lock and increase the air pressure until he recovers, when the process of decreasing it can be started.

The caisson on the Philadephia side of the river was the first in which work was started for the Delaware River bridge. It reached bed rock some time ago. The process then is to level off the rock. Then the sand hogs pack down the concrete poured in from above, backing up until there is no longer room for them to work. The final air space is filled up with concrete, and the sub-structure of the foundation is in place. All that remains to be done is to put up the steel and spin the cable.

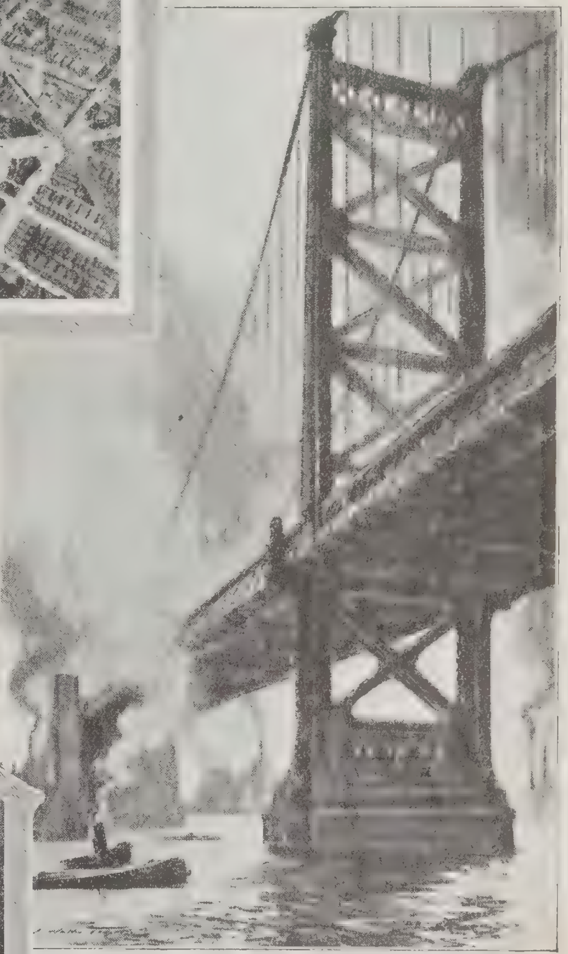
It will be a year or more before that work begins, of course, since one of the big jobs to be done first is to sink the anchorages. The cables are carried over the towers and thence to huge masonry anchors located well in from the bulkhead line. Caissons are used to sink the anchorages, but they are much smaller than the foundation caissons and present less engineering difficulties. The spinning of the cables is done just about the same way a spider spins its web, by a machine that at a distance will look not unlike a giant spider, traveling back and forth between the two towers.

Heretofore, all the large suspension bridges in the world have been built with four cables. The Delaware River bridge is to have only two, on which a dead weight of 33,000 tons of metal will be suspended. The cables will be the largest ever made. Each will be 30 inches in diameter, as compared to 15 3-4 inches in the Brooklyn Bridge and 20 1-2 inches in the Manhattan, the largest heretofore manufactured. The cables for the Delaware bridge are to be made up of 16,500 strands of high-grade carbon steel wire, each 0 192 of an inch in diameter. It is estimated that about 22,000 miles will be used in the two great cables. Each single strand will have an ultimate strength of 215,000 pounds to the square inch, and an elastic limit of more than 144,000 pounds.

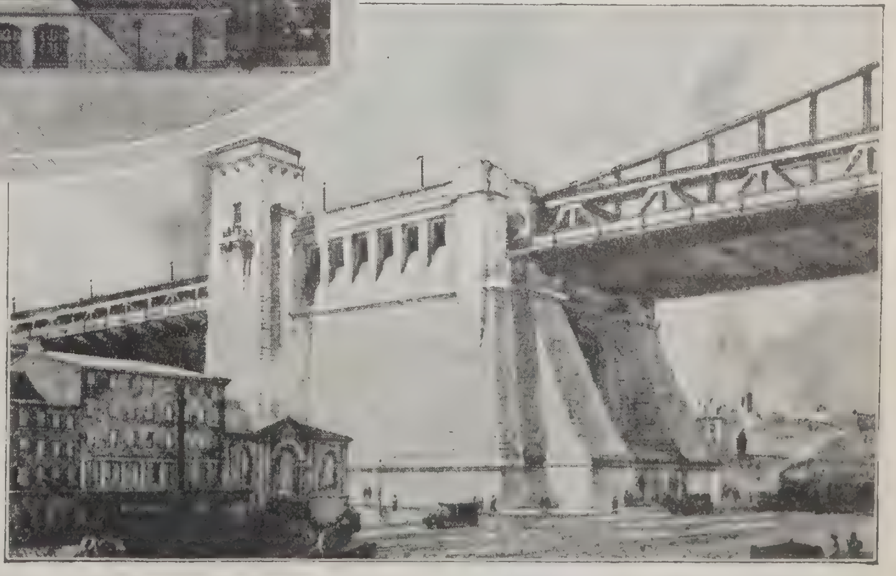
Steel towers were chosen to support this enormous weight because experience has shown that it is difficult to allow for the expansion and contraction caused by changes of temperature when masonry towers are used. Rollers were used on top of the Brooklyn Bridge, the cables passing over them on saddles. It was found, however, that the tremendous weight caused considerable friction and therefore much added strain was placed on the cables before the rollers moved. The steel towers can be made to bend. Any expansion or contraction in the Delaware River bridge will be taken up by the bending of the towers, the cables being fastened to the tops of them. Each tower will be 16 feet wide at the top, widening to 40 feet at the base, with a transverse width of seven feet.

The main span of the bridge will be 1,750 feet, which is 150 feet longer than the Williamsburg bridge in New York, the longest suspension span heretofore built.

The Delaware River bridge will be one of the widest for its length in the world. It will carry an unobstructed roadway for six lines of vehicles, two lines of surface cars and two lines for rapid transit, and two 10-foot passenger walks. The latter will be slung up above the roadway, thus reducing the width necessary to accommodate all the varied kinds of traffic. The total cost of the project was estimated at the outset as $28.871,500. The center of the bridge will be 135 feet above mean high water for 800 feet of its length. The bridge will take a place among the world's most famous structures.



One of the slender steel towers.



Another view of the monolith anchorage.

Producing Jewish "Martyrs" by Propaganda

No Distinct Group Can Say to the Rest "Our Race Can Do No Wrong" But That's Exactly What American Jewish Committee Is Doing!

By CHARLES ALBERT COLLMAN

WHEN, last October, the Federal Grand Jury in Tacoma, Washington, returned indictments against Rolland R. Pothier and Robert Rosenbluth, charging them with the premeditated murder of Major Alexander P. Cronkhite, United States Judge E. E. Cushman, to whom the presentment was made, said: "The court feels that this jury is entitled to the thanks of the public for the services performed." *He added that the indicted men would not be admitted to bail when the bench warrants were served.*

When Robert Rosenbluth was arrested in New York City, *he was at once admitted to bail,* which was furnished by a Wall Street banker of his own race—a leader of the American Jewish Committee—and he has ever since retained his freedom, while his extradition has been fought by a corps of experienced lawyers, also representing the American Jewish Committee.

But when Pothier was arrested in Rhode Island at the very same time, *bail was refused, and he was committed to prison,* where he has remained, while his counsel was opposing his extradition to Tacoma. On January 11, Pothier lost his fight. United States Judge Arthur L. Brown decided that, in view of the law and the circumstances, Pothier must go back to Tacoma and face the charges made against him. He denied a petition for a writ of habeas corpus, and it was stated that the indicted man would be started on the way to Tacoma in a few days, in the custody of the chief United States deputy marshal and two guards, unless their prisoner's removal was stayed by an appeal.

The Network of Intrigue

WHEN the network of intrigue that has been spun about the "Rosenbluth case" comes to light at last, the country will stand aghast.

In the many appeals published on behalf of Rosenbluth in magazines, pamphlets and newspapers, through the influence of the American Jewish Committee, emphasis is laid on the statement that the man who is accused of Major Cronkhite's murder must be innocent because he is vouched for by men of prominence such as Herbert C. Hoover, Secretary of Commerce; Felix M. Warburg, Herbert H. Lehman and Julius H. Barnes.

At the time of his first arrest and arraignment, Rosenbluth explained his absence of a year and one-half from the country with the assertion that he had been in Siberia, Turkey and Russia engaged in collecting information and statistics, which he sold on his return here, to cover his traveling expenses. But later, when he felt himself under the sheltering wings of the American Jewish Committee, he stated that he had gone to Russia and Turkey for the United States Grain Corporation, subsequently going to Siberia at the request of Felix M. Warburg and Herbert H. Lehman, on behalf of the Joint Jewish Distribution Committee, which was headed by those gentlemen.

According to Rosenbluth, four days before he was arrested in New York, he had been in Washington, D. C., reporting to Mr. Hoover. Exactly what he was reporting to the Secretary of Commerce, he does not state. However, Mr. Hoover, for many years previous, had been a partner in the mine operating firm of Bewick, Moreing & Company, of London, during which time he had become a director in the Russo-Asiatic Corporation, Ltd., and other mining properties in Russia and the Far East. It may be quite natural that Mr. Hoover wished to gain some information concerning the condition of such properties from a person who had been traveling through those countries for so long a time.

Some Facts on Institute

NOW Mr. Hoover was Chairman of the United States Grain Corporation, to which he had appointed Julius H. Barnes president. Also, when Mr. Hoover organized the American Relief Administration in Russia, he gave Mr. Barnes the post of vice-chairman, in charge of the work in New York. Mr. Barnes is a wheat exporter from Duluth, with an office in New York. He is also "chairman of the Institute for Public Service, New York," which, despite its resounding name, is a publicity and propagandist bureau, familiar probably to only a score of persons in the metropolis. Robert Rosenbluth was at one time an "assistant director" of this so-called "institute."

Julius H. Barnes, in 1919, signed his name to a pamphlet entitled, "Teachable Facts About Bolshevism and Sovietism," which he offered for sale at special rates for large quantities, to teachers, classes, co-workers and others. In this peculiar document, Mr. Barnes quotes Robert Rosenbluth, formerly his assistant director, in a report made to him by the latter from Kharkov, Russia, July 27, 1919, "just after it was reclaimed from the Bolsheviki." Just what Rosenbluth was doing in Kharkov at the time, Mr. Barnes does not say. Some indication of the contents of this pamphlet was given in a previous article.

Mr. Barnes is chairman of the Institute for Public Service, and William H. Allen, social worker, is its director. Mr. Allen, also, as published in a previous chapter, is sponsor for an appeal to United States Senators on behalf of Rosenbluth, who, he asserts, is "being unjustly hanged alive." This singular "Institute" has circulated immense quantities of folders in public schools and among American school children, informing them of a "long recital of injustices done Captain Rosenbluth, and of wrong done by you and me—100,000 000 of us—through the United States Attorney-General."

To the average American mind it would appear inconceivable that a person like Mr. Barnes, who quite recently was elected a trustee of Vassar College, should countenance a campaign instructing school children in disloyalty to the United States Government, and contempt toward its officials. Undoubtedly this matter must yet be explained, *but it cannot be explained away.*

There is in existence a letter written by Herbert C. Hoover to Attorney-General Daugherty, in which he says:

> It just happens that practically all the time since the war, Rosenbluth has been employed by relief organizations in Europe with which I am associated, first in South Russia and later in Siberia.
>
> I fear there is a great miscarriage of justice in the whole process.

It is scarcely possible that Mr. Hoover meant thereby to stand sponsor for all the activities of Robert Rosenbluth in Eastern Europe and Asia, but his letter gives that unfortunate impression.

It will be recalled that about this time, Rosenbluth, in his attacks published in the *Daily News,* was characterizing the Department of Justice as a "rotten organization," and charging that its officials were "out for cash," demanding that he raise money from his "rich Jewish friends" if he wished the charges against him to be dropped.

Is it possible that the American Jewish Committee has achieved such power that it can play off one member of President Harding's Cabinet against the other, in the interest of a member of its race, who stands indicted for one of the gravest crimes in the criminal code?

Besides, what has all this to do with the "secret code," a section of which was published in the second chapter of this series, and whose numbers run from one to two hundred and ten?

The following numbers may be recalled by the reader:

175. Situation now justifies our showing our hand, and I so recommend.

179. I am to be chairman of commission to arrange settlement of foreign goods here now.

181. You are to be general agent America, duty to bring in every person with such claims.

201. Secured concession with full rights and guaranties, according to principles laid down by us for years.

Victims of a Program

UNDOUBTEDLY the American public should be entitled to know the identity of the persons who are about to *"show their hands"*; what individual is to be made *"chairman of the commission"*; who is *"to be the general agent in America,"* and who is about to secure the *"concession according to the principles laid down by us for years."*

Those persons who have been led to believe that the "Rosenbluth case" consists of a series of exceptional circumstances will be surprised to learn that they have been made the dupes of a cut-and-dried program of the American Jewish Committee, which the machinery of that admirably organized body duplicated in its main features in a similar case, only eight years past. Then, also, the Jewish population was lashed into an insane frenzy by the well-calculated efforts of its leaders, the country echoed with the sounds of racial conflict, and deeds of violence resulted.

The normal processes of American life exercise a disintegrating effect upon any attempts of a foreign race to maintain a separate existence in this country. This fact is the bugaboo of the heads of the American Jewish Committee, to whom "separatism" is an essential part of its program for the future. Therefore, periodically, they create an imaginary case of "Jewish persecution," give it intensive publicity, encourage racial clamor, and raise the old Yiddish war cry: "Anti-Semitism!" *From past experience they know that those of their people who have become wearied or disgusted with organized Jewry will then be drawn back into the fold; the Jewish lodges will be refilled with members, and fresh impetus and increased support will be given to the innumerable Jewish "movements" that are churned into activity.*

In April, 1913, a little girl, 14 years old, named Mary Phagan, was found murdered in the basement of a factory in Atlanta, Georgia. Leo M. Frank and Jim Conley, a negro, were arrested on suspicion. They were placed on trial, and a jury found Frank guilty. He was sentenced to death in August of that year. These events had taken place according to the ordinary processes of law, and without any especial attention being attracted to them, aside from the fact that the crime had been a particularly atrocious one.

But suddenly word of the situation was brought to the American Jewish Committee in New York, and its leaders, at a conference, decided that the case was an opportune one to be churned up into an example of "Jewish persecution." To the heads of this organization it is always a matter of complete indifference whether the person whose cause they take up is innocent or guilty. Their predominant idea is to start the cry of "Anti-Semitism," provoke a racial collision, and thus weld the bonds of organized Jewry into a more compact and resistant mass.

As in the "Rosenbluth case," the Jewish Committee decided that a large group of lawyers must be engaged to reopen the case and make an attempt to liberate Frank.

Similarly, they should carry the case to the highest courts, and bury it there, if possible.

Similarly, a great fund must be provided to engineer a country-wide publicity campaign, depicting Frank as the innocent victim of race prejudice.

And also, every effort must be made quickly to throw discredit upon the evidence and the testimony of witnesses, which had led to Frank's conviction.

The nation-wide machinery of organized Jewry was set in motion.

The unsuspecting people of Georgia, who had been waiting patiently for the sentence of the court to be carried out on a man convicted of a crime committed in their own community, were suddenly amazed by an influx of strangers from a distant state, who began to practice upon them all the "raw tactics" which the operations of the Kehillah have made only too familiar to the residents of New York City. The laws and the law courts of Georgia were ridiculed and denounced. The people of the state were reviled.

Bitter attacks were launched against the head of Solicitor General Dorsey, as they are being directed today against Attorney-General Daugherty and Colonel William Hayward.

That Atlanta "Frame-Up"

THE Atlanta police were charged with having "framed-up" Frank, as the agents of the Department of Justice are being accused of having "framed-up" Rosenbluth.

Just as the shielders of Rosenbluth have been demanding a special investigation of his case by persons selected by them, so in the "Frank case," William J. Burns and his detective agency, were engaged—"at an enormous retainer," as it was then reported—to make a special investigation. Mr. Burns followed his instructions with such zeal that he was charged with violating the detective agency law, his license was revoked and he was held in contempt of court.

Georgia was thrown into a turmoil. Agents for the defense were charged with bribery and spiriting away witnesses. As in the instance of Pothier, persons who had made affidavits in the "Frank case," were persuaded to "repudiate" them.

Louis Marshall, president of the American Jewish Committee, thundered away in the law courts on behalf of Frank.

As Rosenbluth's case has been denominated another "Dreyfus case," so Rabbi Henry Berkowitz likened that of Frank to the "Mendel Beilis case."

As Rosenbluth has been defending himself by attacking his prosecutors, so Frank was provided with publicity media and began attacking the police and his prosecutors.

Probably no other criminal in United States history has had his appeals taken to so many courts. After he had been sentenced in August, 1913, the American Jewish Committee brought a motion for a new trial in October. Motion denied. Case carried to the state supreme court for re-trial. Denied February, 1914. Every resource of the state courts having been tried, Louis Marshall took Frank's case to the United States Supreme Court, making the appeal on a question of writ of error. After long consideration, the court decreed that no such writ of error lay, and left Frank's sentence still operative.

Oh, Yes! Louis Was There

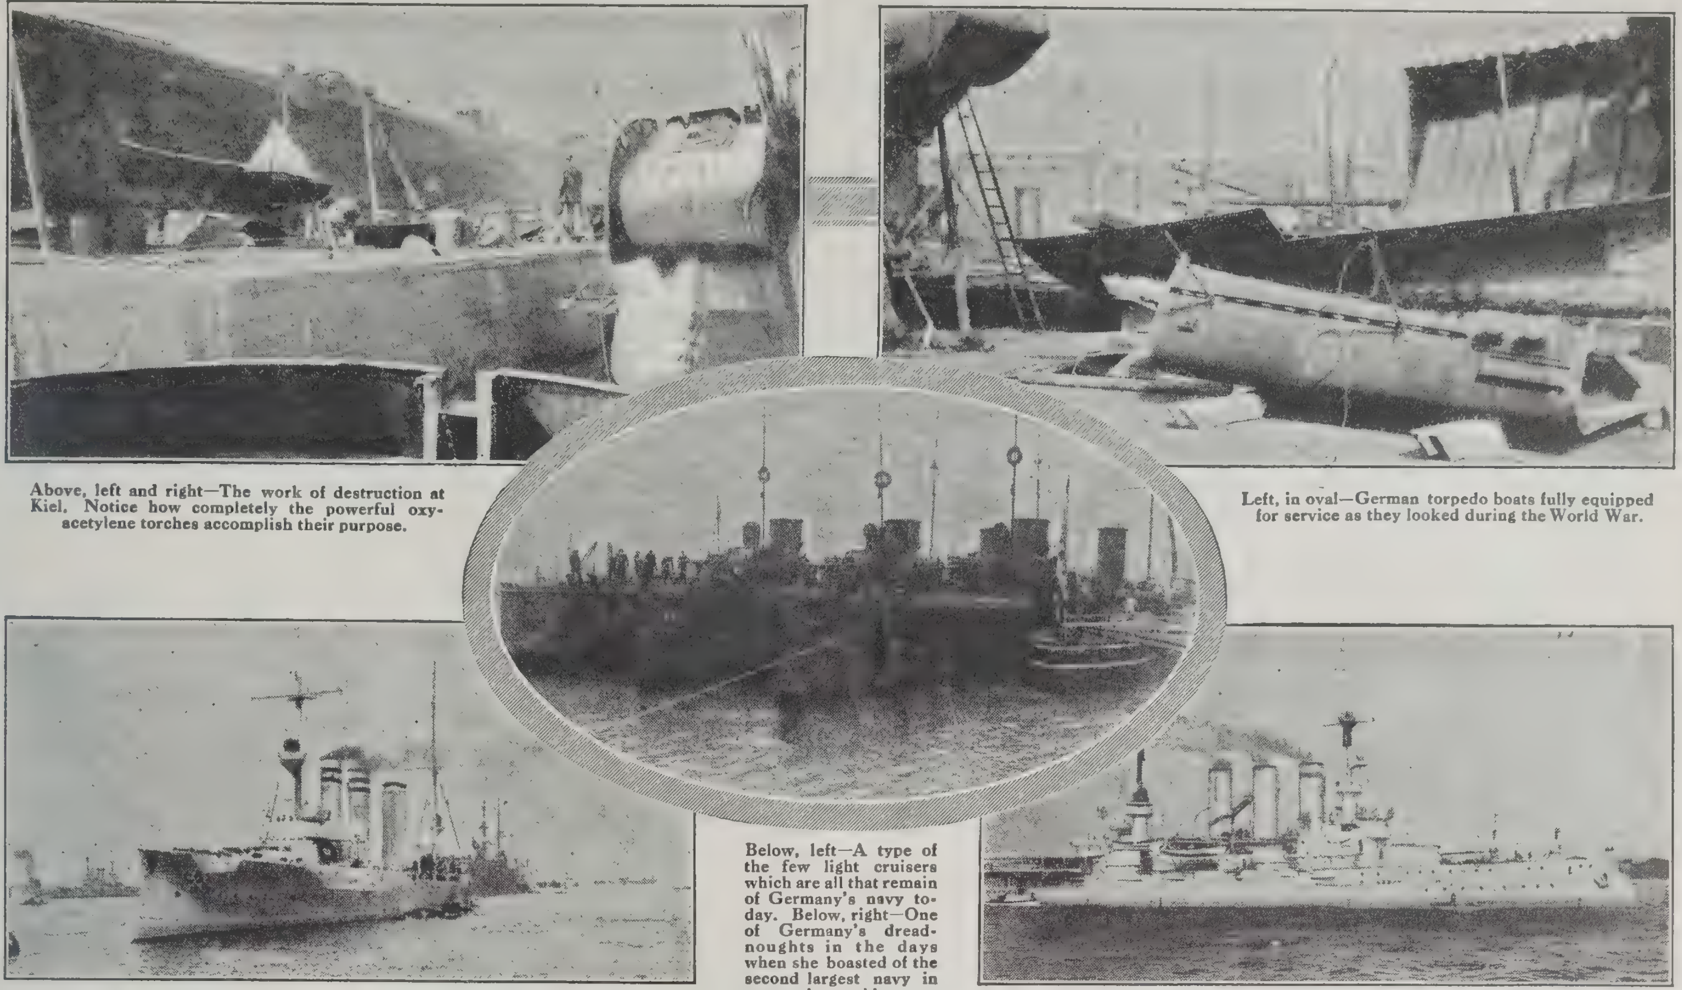
THEN Frank's lawyers appealed to Justice Lamar, who granted them a hearing on a writ of error. The court, after listening to Louis Marshall, declined to issue a writ and for the third time Frank was sentenced to death. His lawyers then arranged for an appeal to the state prison board. Petitions were circulated throughout the country, private appeals were telegraphed and written to Georgia's chief executive, prominent men were engaged by the Jewish Committee to write articles and analyses of the case. The state prison board refused to act.

As special counsel, the law firm of which the governor of the state was a member, was engaged to defend the condemned man. Mass meetings on behalf of Frank were arranged by the Jewish Committee in Brooklyn, Philadelphia, Chicago, Denver, Springfield, Illinois; Indianapolis and other cities. Letters asking mercy for Frank, to the number of 75,000 were sent to Governor Slaton.

Prominent newspapers owned by members of Frank's race, added daily to the clamor. From March, 1914, to August, 1915, Mr. Adolph S. Ochs, in the New York *Times,* published more than 54 long editorials on the Frank case, and under titles such as, "Justice, Not Mercy," and "Pardon for the Innocent," he fed the emotional hunger of his race for distrusting the people among whom they have elected to live.

Space forbids a further description of the Frank

(Concluded on page 14)



Above, left and right—The work of destruction at Kiel. Notice how completely the powerful oxyacetylene torches accomplish their purpose.

Left, in oval—German torpedo boats fully equipped for service as they looked during the World War.

Below, left—A type of the few light cruisers which are all that remain of Germany's navy today. Below, right—One of Germany's dreadnoughts in the days when she boasted of the second largest navy in the world.

Locomotives and Plowshares for Europe

By WALTER M. WOLFF

IN THE antebellum days Germany possessed a flotilla of torpedo boats whose colors could be seen almost anywhere on the seven seas. That she also bragged of a goodly number of other war craft is borne out by the figures which showed alone a gross total of 5,500,000 tons of merchant ships to Germany's credit.

The Peace Treaty left her just 500,000 tons of small, harmless vessels.

The dangerous water-fighters of every type were either destroyed outright or junked and the proceeds reconverted into more useful and more peaceful works of reconstruction. Of this latter group, the once-powerful German torpedo boats were destined to be cut up into bits like cardboard as if to make sure of their complete annihilation. Needless to say, none of them were ever remodeled again.

Recently, as I passed along the wharf at Kiel, Germany's former grand naval base where a few years ago great warships of every type lay in the course of construction, the work of destruction was still in progress. All along the wharf at one end of the big harbor lay strewn about great hulks of wreckage, and close by—chained to the docks like so many prisoners waiting to be slowly put to death—were the remains of what once was the pride of Germany's navy—the mighty torpedo boats. But the work of the oxyacetylene torch is usually complete. I saw no 10-ton crocodile shears such as are used by our Navy Department in demolishing old relics of the past, but the great destructive force of the white-hot torches startled me. In a very few minutes the man in charge of a torch was able to cut away a piece of heavy plate perhaps four inches in thickness, and in a half-hour more great chunks of steel lay scattered about like driftwood after a storm.

The Germans, quite naturally, are not anxious to talk about the work of destruction. They view the workmen as they cut strip after strip with grave faces, and say nothing. A few glances and they seem to have seen enough. Nobody likes to live near a graveyard—and Kiel is Germany's iron graveyard. And so it is that an old resident of Kiel who, perhaps, has seen these very same boats steam swiftly out of the harbor full of cheering jackies, now feels a pang of regret that it was "all for nothing." And Kiel in 1914 was a far greater sore spot for England than were ever the Dardanelles at any time. Every type of modern warship lay ready for instant action within the well-protected harbor; and submarines and torpedo boats could slip out into the Baltic almost at will from the Kiel base. Today a few old second-class cruisers of the type shown below still remain to Germany—the shell of what once was in the annals of German naval prowess. And Kiel harbor itself has undergone severe changes. Aside from the energetic work of demolition, the great Germania shipyards are fairly busy filling orders for small merchant ships, but as a whole Kiel is quiet, much as a cemetery should be. The harbor is large and for warships is almost in a class by itself, but it has—perhaps forever—served its purpose in this direction.

While the workmen toil to remove the now useless metal, German foundries and shops are taking all they can get of the sheets and parts. As the world is beginning to realize, Germany is growing mighty short of iron and steel, and these big veterans of a past disaster can certainly contribute their share to the good cause—Europe's reconstruction. Be it ever so little, every little bit helps! This policy Germany has long ago taken unto herself, and if France has one more plowshare for her devastated area next spring and Russia gets an extra shipment of car wheels or other equipment for her badly shattered railways, one may be sure that the spirit of a once-daring torpedo boat or battle cruiser haunts the recast product and glistens peacefully new in the sunlight.

Europe, and above all Germany, has much to be thankful for, among which being the great agents of industrial progress, the oxyacetylene torch and the blasting furnace. As is shown in the pictures nothing is too thick or hard for the little fire-eating instrument; if the victim but holds still, the torch will do the rest—not only safely, but also surely and completely.

What Will Our "Liberals" Say on Credit?

Concluded from page 10

counterfeit "liberalism," so generously nourished by the international loan sharks, a most grateful means of self-expression. Under ordinary circumstances they would not be worth worrying about, but in the present chaotic political situation, they are a menace because of the abundant literary resources placed at their command by the calculated largess of the international note shavers. This has happened at a time when the art of mass suggestion has developed into an instrument that even fools may employ; and the rise of the slum power and the increase of the slumite populations have created a vast new audience for decadent litterateurs and journalistic demagogues, who have their own economic reasons for exploiting the slum mind.

The rise of the moron press shows the effect of the slum power on journalism. The frequent efforts of promoters of newspaper decadence to control progressive political movements for their own aggrandizement are another expression of the common interests and objectives of finance capital and the slum power. Probably the most enlightening instance of their identity of aims is afforded by their joint effort to repeal the restrictive laws now limiting immigration from Southeastern Europe and Western Asia. The racial and economic motives which impel international finance to favor the continued flow of disruptive racial material into America are too obvious to need discussion in view of what has gone before. How nicely these motives dovetail with the imperative need of the moron press for a continuous supply of new readers of the mentality that only the steerage can supply in sufficient volume!

The audience that the owners of the moron press discovered for their newspapers has become the overpowering lure for other publishers. A glance into a bookstore window or at a display of current magazines is enough to show that there is a popular mentality today that has, through the sheer power of its economic demand, subverted American standards of taste and expression. Morbid eroticism is the keynote of what its mountebanks call the "American literary renaissance" which Dr. Ludwig Lewisohn dates from 1912. Its artists boast that they paint "life." They do, but it is slum life—not American—even though some of the slums they picture are outwardly suburbs or country estates.

They boast of realism, of course, but their realism in the realm of psychology appears to be the reaction of grown-up sissies or neurasthenic women to a kind of life that "romanticists," like Mark Twain or even Jack London, would have called disease. If the renaissance had the courage of its convictions it would select Bellevue, Sing Sing or Dr. Hickson's psychopathic laboratory in Chicago as studios in which American life should be studied by novelists.

Back of all these manifestations are the very real and personal figures of the international note shavers, who have contributed directly or indirectly to all of them. International finance has nourished the decadent tendencies which serve it so well.

Aside from this, there is a natural affinity between the views of the international financial clique and the demagogues and weaklings who propagate the cults of inefficiency and decay. Financiers do not produce THINGS—either goods or machines for making more goods. They base their wealth and power on paper transactions which always lean upon GOVERNMENT for validity. The constant effort of big finance is to build up privately controlled government fiscal systems, to buttress their usury with the police power of the state. Finance capital is compelled to control governments, to favor the extension of bureaucracy and the mandarin class, to crystallize its speculations, loans and gambles, to say nothing of its frauds, into obligations indorsed by government and enforced by the might of the overgrown state machine. The similarity of such aims with the hopes and plans of the various schools of socialism and its allied cults is too plain to need further exposition.

If the new progressivism is to escape the fate which overtook the New Freedom, it must walk most warily amid the mazes created by this interaction of international banking and the forces of race decadence. It must examine realities and ignore labels.

Milwaukee Sees Folly of Not Paying Cash

Now Has Taken Lead Among Large Municipalities in Righting Its Finances

By WM. H. WENDT

MILWAUKEE is leading the large municipalities in the United States in its endeavor to become eventually a strictly cash customer. In fact, so far in advance of the usual methods is the Milwaukee idea of ultimately being in a situation where all expenditures will be made from funds collected before rather than after the indebtedness has been incurred, that scoffers are apt to look upon the plan as an idle dream. That this dream may be translated into a reality though it might take many years is indicated by what has already been accomplished.

The end of 1922 saw all independent boards on a cash basis through operation of the so-called taxation readjustment fund. The next step will be to place other city departments in a similar position and the last phase will be to eliminate bond issues. The last is the most difficult. Recently the city controller's department has announced tentative plans for the future elimination of bond issues. Elimination of bond issues will save the city in excess of one million dollars a year in interest. Though the transition from financing large public improvements by bond issues to one of cash payment is a huge undertaking and will require many years for realization, it is entirely within the realm of the possible.

The success of the tax readjustment law in placing numerous independent boards on a cash basis, with the resultant saving of much money formerly paid out in interest, indicates that we are on the right track.

The diagram of the distribution of the city's tax dollar for 1921 shows that 1 1/10 cents out of each dollar applies to the taxation readjustment fund. This is equivalent to about 37 cents per capita. The good that has been accomplished by this small item since 1914, when the taxation readjustment law was drawn, is reflected in the city's financial condition today.

Under this law approximately $1,145,000 has been collected, of which $625,000 has been used to place various departments of the city government on a cash basis. That is to say, the taxes for those departments are collected now in advance instead of being collected after the expenditure has been made.

Under the old plan practically no city taxes were collected until the end of the year, leaving the city treasury to operate during the year on the cash which it received from current revenues, such as licenses and permits, and thereby invariably compelling the city to borrow money to finance itself to the end of the year.

Under the new plan it was possible in the year 1914 to place seven of the smaller city departments on a cash basis; in 1915 six more were added; in 1916 three more. By 1917 practically all the smaller departments of the city had been placed on a cash basis and at this time the school repair fund was included; then, in 1918 the public library was included.

Now More Than Half Million

SINCE that time the fund has been allowed to accrue, until now it approximates $520,000. It is anticipated before another year passes there will be sufficient money in the fund to place the entire activities of the park board on a cash basis. This will complete the work of placing all independent boards and commissions on a cash basis and thereafter the remaining city departments will be gradually included under the plan.

It is interesting to note that at the time the various departments were placed on a cash basis the total amount required from the taxation readjustment fund amounted to about $650,000, but it is found today that these same departments have increased their cost of operation so that their budget is approximately $1,300,000. This means the taxation readjustment law has practically doubled its usefulness, for if it were necessary today to place these funds on a cash basis, the entire amount collected under the law would not be sufficient to accomplish the purpose, whereas this has been accomplished and still there is more than $500,000 on hand.

While the departments in operation in the year 1914 have been thus gradually placed on a cash basis, the rule of placing all new activities since that time, on the same basis, has been adhered to. Accordingly, the harbor commission, art commission, board of appeals and public land commission were from their inception included in the cash budget. These activities, while requiring but a nominal sum in the beginning, have increased their appropriations approximately 500 per cent.

While it is true that prior to the passage of the taxation readjustment law, some of the funds of the outside boards and commissions were levied in advance, it is only fair to say that the city in placing them on that basis has gone far to assist in carrying out the present plans, as included in such funds are three of the school funds approximating $1,500,000 in 1914 and today $5,300,000. If it were necessary to include them under the city's financial readjustment it would probably add 30 or 40 years to the period required to get all of the funds on a cash basis.

At the same time that the taxation readjustment law was prepared, a law, which is intended to replace the loss of cash due to the fact that some taxes can never be collected, also was prepared. When the taxes have become delinquent and they are not bought up by private parties at the time of the city's tax sale, the city takes over the account and issues a tax certificate to itself. Eventually all but a very small part of these taxes are collected, but no provision had been made to replace this resulting loss of cash and this had been allowed to accumulate ever since the early days of the city.

In 1914 the tax deficit law went into effect, since which time $458,000 has been collected without placing any burden upon the taxpayer to relieve this shortage. In addition thereto, provision was made to take care of the unpaid taxes of the future, under which law approximately $8,000 has been levied. Likewise, since 1917, $45,000 has been collected to take care of delinquent assessments for installments on street improvements, all of which have greatly operated to place the city on a sound businesslike financial basis and that without causing any undue hardship to the taxpayer.

That the ultimate elimination of all bond issues and the consequent operation of city finances entirely on a cash basis, with an immense saving of interest, is not as fantastic a proposal as may be thought is indicated by what has already been accomplished in this direction.

From 1912 to 1921, inclusive, proposed bond issues aggregating more than $8,000,000 have been supplanted by direct taxation, with the resultant saving of $5,000,000 in interest, city and legislative action making these changes possible. The first step toward supplanting bonds by a pay-as-you-go plan was taken in 1912. A proposed issue of $100,000 to refund bonds then falling due was eliminated and included in the regular tax for sinking fund purposes.

It had been the practice prior to 1912 to issue bonds to cover the city's portion of street improvements. More than $3,000,000 in such bonds had been issued and the interest thereon had amounted to more than $1,300,000.

Inasmuch as the pavement was frequently torn up and replaced three or four times during the life of one bond issue, it was considered a good policy to discontinue the issuance of bonds for such purposes, in view of the fact that the life of such bonds extended over 20 years, resulting in an interest cost of practically double the original cost of the paving. Accordingly, in 1912, bond issues for permanent street improvements were eliminated, since when $3,300,000 street improvements have been paid for by a direct tax, which in itself resulted in a saving of more than $1,500,000 in interest to the taxpayers.

How Interest Is Saved

TAKE the case of dredging the rivers. For the ten years prior to 1915 a total of $810,000 of bonds had been issued for dredging. Considering the fact that the river must be redredged each year and that the bonds ran for 20 years, it is readily understood that the issuing of bonds for such recurring expense was the most vicious practice the city could adopt. In 1915, this class of bonds was abolished and since that time the cost of such work has been paid by a direct tax.

At the time the city entered into its program for the establishment of a sewerage disposal system to purify its water supply, the cost of the work was estimated at approximately $10,000,000. It was not considered advisable to place the entire cost of this work on the present generation by direct taxation, nor was it considered advisable to add any such large sums to the city's tax levy for the years required to complete the work.

Under the plan adopted, the work was financed partly from bond issues and partly by a direct tax. During the eight years in which the financing of this work was under the city's jurisdiction, practically $4,000,000 was derived from direct taxation and $5,660,000 from bond issues.

In 1915, all installments on park land contracts for which the installment of interest and principal had formerly been paid from bond issues were paid in full and the vicious practice of paying interest on these contracts from proceeds of bonds was eliminated, at a saving to the taxpayers of more than $300,000.

Under a law prepared by the controller and passed by the state legislature in 1917, it has been possible to eliminate many other bond issues. This law provides that whenever the budget has authorized the issuance of bonds, the common council may substitute in lieu thereof a direct tax whenever it deems it advisable to do so.

Under this plan, $280,000 in bond issues has been eliminated and a direct tax substituted covering such purposes as the reconstruction of the Twenty-Seventh street viaduct, the purchase of motor apparatus for the fire department and the installation of electric lights in the public parks; various building projects coming under the bureau of bridges and public buildings, approximating $200,000, have been financed on a cash basis. In addition to this, all land purchased, approximating $120,000, has been paid for without issuing bonds.

All told, during the period covered by the administration of the present controller, in excess of $8,000,000 of what would formerly have been bond issues has been eliminated, resulting in a saving to the taxpayers of approximately $5,000,000 in interest. When it is considered that more than $8,000,000 of permanent public improvements have been financed on a pay-as-you-go basis without any excessive burden being placed upon the shoulders of the taxpayers, there can be no room for doubt as to the fact that great advancement has been made toward reducing the evil of bond issues, placing the city in a very advantageous position in so far as the future is concerned.

As the years roll by and the city is able to eliminate more and more of its bond issues, a great part of the credit will undoubtedly be placed on the period covered by the last 10 years, during which time the initiative has been taken, the taxpayers educated up to it, and the old evil practice of issuing bonds for improper purposes discontinued.

Future Aids Program

GRADUALLY the city will find itself more favorably situated to add to its program in this respect, and this, together with the taxation readjustment fund, and plans which are now being developed for the further elimination of bonds, will result in reduced taxation without curtailing public improvements, which means growth and prosperity to the city.

A saving to taxpayers of Milwaukee in interest on bond issues, amounting to $2 on each $1,000 of the assessed valuation, would result if bonds were eliminated from the city's financial scheme. The evolution of such a plan will constitute one of the most interesting chapters in Milwaukee's financial history and command the attention of municipalities throughout the country, since many cities are now suffering from an overload of bond issues. Today seven and one-tenth cents out of each $1 paid for taxes is for interest on bonds and the amount increases each year as more bonds are issued.

The city is advancing from its general fund $2,500,000 to cover the assessable portion of street paving. Interest paid to the city by property owners under this plan has aggregated $300,000 and in the future will exceed $100,000 a year. Other interest which the city is earning from the investment of its cash balances is approximately $400,000 a year. The interest thus earned in the past has been returned to the taxpayers in the form of revenue. It is now proposed to lay aside the interest earnings of the city to create a fund to be invested in City of Milwaukee bonds and allowed to accrue and compound itself for a period of years, thereafter to be appropriated for financing of permanent public improvements formerly financed through the issuance of bonds. Such action will stabilize the tax rate, conserve the city's bonded debt limit, save interest to the taxpayers and add to the attractiveness of such bonds as the city might issue.

It is estimated that by laying aside $300,000 per annum from the city's interest earnings, a fund of $4,000,000 would accrue within 10 years and in this manner the interest earned would ultimately eliminate at least a great part of the interest burden now carried by the taxpayers. This plan will go far toward remedying present conditions and start us toward the long-sought goal of paying but one cost for public improvements and eliminating the interest burden caused by bond issues, which add 50 per cent to the cost of the undertaking.

Producing Jewish "Martyrs" by Propaganda

Concluded from page 12

case, in showing how closely it parallels the methods adopted by the same racial group in the case of Robert Rosenbluth. On the eve of his retirement from office, unable longer to withstand Jewish pressure, Governor Slaton commuted Frank's sentence to life imprisonment. But the feelings and susceptibilities of a sensitive southern people had been outraged to the breaking point. They burned their governor in effigy, the militia was called out to protect him, and finally a mob took Frank from prison and lynched him. But all this tempest and turmoil, which had been stirred up by the American Jewish Committee, was highly satisfactory to its leaders in New York.

The difference between the case of Leo M. Frank and that of Robert Rosenbluth is that the latter has not yet been tried, and the men who shield him declare that the witnesses against him shall never be heard. "And Frank was guilty as h——l," to quote the words of a prominent officer of the government, with whom I was discussing the case the other day.

The aim of American Jewry is "an autonomous racial state." But no race practising "separatism" can be assimilated by the people of this country. **No distinct group can say to the rest: "Our race can do no wrong."** No single people has a monopoly of crime, as none has a monopoly of all the virtues.

We have had the "white slave scandals," the "Rosenthal case," the "Brandt case," the "Lamar-Lauterbach case," the "Barnet Baff case," the "Leo Frank case," the "'Nicky' Arnstein case," the "George Graham Rice case." Each of these has been a great crime, or an assault upon the social body. Now one race actually assumes the right to defend such of its members, who are accused of crime by assaults upon the native people. No civilization can long withstand such cumulative shocks, with their accompanying disturbances.

The American Jewish Committee, and its local body, the New York Kehillah, are undeniably the most dangerous organizations that threaten our national life. There appears to be need imperative for a Federal investigation into their activities, back to the period when they obtained their charters on false pretexts.

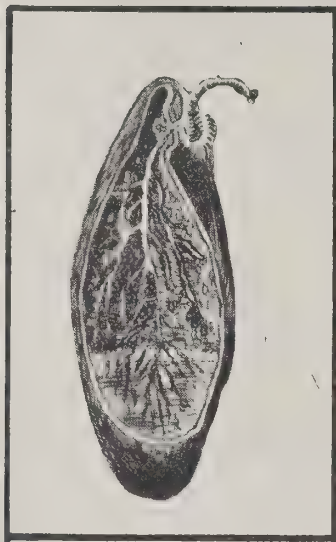
International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

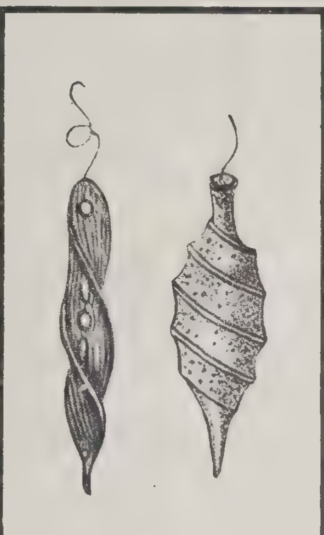
The New Science of Biotechnics

THE modern scientist and engineer is justly proud of his practical achievements. Human inventive ingenuity has produced marvelous devices and machines which have contributed to man's comfort and changed the mode of living. We must admit, however, that compared with Nature the engineering achievements of man are crude and uneconomical. Recently a new science has been founded upon this admission as its principal thesis. The purpose of this new science is to study Nature's mechanical devices for the purpose of applying the lessons taught by the Great Silent Teacher to the problems of human engineering. The new science is called Biotechnics and inventors will find its study profitable as well as pleasurable.

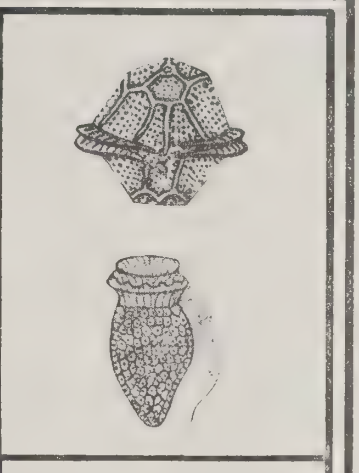
One of the foremost leaders in the new science is Professor R. H. Francé who has reduced Nature's fundamental structural devices to the following: the rod or staff, the flat strip or band, the plane, cone, sphere, screw and crystal. These are the seven forms of all that exists in the physical universe and Dr. Francé maintains that all physical processes involve merely combinations of these basic structural types. He holds, moreover, that human inventiveness will never be able to transcend these forms.



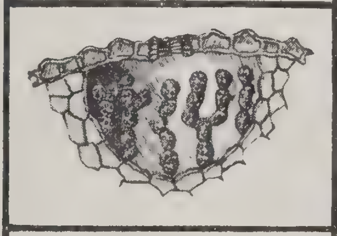
A Dischidia leaf, one of Nature's perfect refrigerating machines.



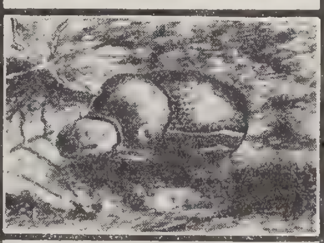
Nature's submarines, the Helical Flagellates.



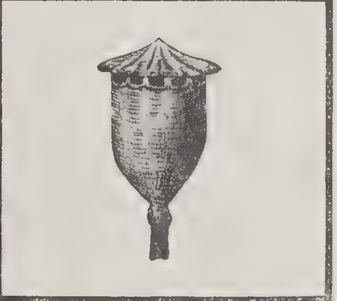
Two types of natural turbines (Peridineae), found in the sea.



The Marchanita Moss, one of Nature's perfect power-plants.



The Weather Bug (Copris Carlina), peculiarly sensitive to atmospheric changes.



The Poppy seed caster, a perfect natural mechanical device.

The new science has proved that Nature has solved all the problems of mechanical efficiency. The first law of Biotechnics may be stated as follows:

Natural processes occur with the greatest possible efficiency.

This law is equivalent to the statement that all natural processes advanced by the shortest path. The second law of Biotechnics deals with the forms of the various objects and organisms in Nature and states that all natural objects arrive at their most suitable form while offering the least resistance to that which causes the change in shape. It follows from this law that an ideal geometrical form corresponds to every natural process.

More than a quarter of a century ago the great thinker, Ernst Mach, of the University of Prague, foreshadowed the fundamental conclusions of this new science of Biotechnics. Mach experimented with the shapes of fluids and proved that the outside or external enveloping area of any liquid form is always the least possible under the existing circumstances. The science of Biotechnics brings to our attention forcibly the great plan of conservation in the cosmos.

This new science which is eminently practical had a decidedly practical beginning. Dr. Francé is a biologist. While making some biological experiments he found that he needed a very efficient shaker but search in the ordinary channels of trade failed to reveal one suited to his requirements. The thought finally occurred to him that it might be possible to find an example of the desired device in the Archives of Nature. His surmise proved correct and he found that the poppy capsule with its distributing holes located below the lid of the capsule constituted a more efficient seed-spreading device than any invented by man. He was granted a basic patent on an exact reproduction of this feature of the poppy without any opposition. This incident should teach a valuable lesson to inventors in search of novel and efficient devices. A search in Nature's Mechanical Museum is likely to be more fruitful than a search in the records of a Patent Office. This incident was the beginning of the new science of Biotechnics.

Dr. Francé then began a well-defined and systematic exploration campaign into Nature's Mechanical Library. First he desired to ascertain what constituted Nature's elementary structural devices. In man-made structures, roofs and floors are supported by columns, posts, or their equivalents. In Nature, wherever a supporting device is required, we find the equivalent of a column. Corn is supported on slender hollow rods or columns whose bearing power and wind resistance is enormous compared with their cross-sectional area. Wherever a natural device functions by exerting direct pulls then the band or flat strip is in evidence. Muscular fibers are of this type. Everywhere in Nature we find the plane serving many useful purposes. The plane is used in Nature in all cases where comparatively large area exposures are required for the proper functioning of a natural structure. The leaves of flowers and trees are a common example of Nature's use of this fundamental structural element.

The cone and the sphere are favorite forms in Nature. The remarkable properties of the sphere are such that this form is the archetype of all the forms in the cosmos. The celestial structures ultimately revert to this form as the goal of change. Protoplasm, the fundamental element in living structures, is so marvelously responsive to the requirements of its environment and individual needs that its form and shape change in accordance with both these influential factors. Protoplasmic cells assume the spherical shape as soon as their functioning requisites are satisfied. We may say that the spherical form is typical of a condition of equilibrium.

The automotive devices of Nature are constructed in such a manner that they will most efficiently overcome resistance. It is for this reason that we find the spiral motion as the most prevalent translatory type of motion in the universe. The wonderful harmonious adjustments of Nature's devices is typically illustrated in the astounding fact that the automotive devices assume shapes which conform with this spiral movement. Devices which exist by penetrating through other forms are constructed in conformity with the principle of the helix or screw. This is true of the *Spirochaeta* which, because of its helical form, can penetrate between the cells of any tissue. Propeller shapes are common in Nature and types of miniature airplanes have existed during millions of years. In the ocean, rivers and lakes we find natural mechanical structures equipped with propeller devices for locomotion through the water.

The crystalline structures are so numerous and common in Nature that particular reference to this type is not necessary.

Some structures in Nature embody great improvements upon complete industrial plants. The *Dischidia* leaf is an interesting example in that it includes a complicated ventilating and drying system, a refrigerating machine and an hydraulic press. There are numerous examples of vegetable organisms which perform work by means of the sun's energy. In certain natural devices the rays of the sun act in the same manner as steam in a steam engine. The manufacture of chemical products by the action of the rays of the sun is another interesting installation found in Nature's Laboratories. In one such little manufacturing establishment carbonic acid and water is converted into starch. Hydraulic engineers will profit much by carefully investigating Nature's method of lifting water to heights not approached, even in a small way, in any of the engineering works of man. In the eucalyptus tree of Australia water is in some cases pumped from the ground to the enormous height of 500 feet.

The little *Helical Flagellates* which float below the surface of the water are simple types of Nature's submarines. The organisms of the sea present to us some of the most ingenious mechanical devices in the entire universe. The speed of the Helical Flagellates when compared with that of our fastest vessels is enormous. If the speeds are estimated in terms of the respective lengths then the flagellates develop a velocity about 80.000 times that produced by the speediest moving sea-going craft built in modern times. Naval architects will do well to ponder upon this startling fact. About 160 different varieties of the sea plant *Peridineae* are known, each constituting a modification of the principle of the turbine. Some of these types contain special passages and water-flow governing devices which permit the plant to rotate when the water passes through its mechanism. These little plants, less than one hundredth of an inch in length, are turbine rotors of much higher efficiency than any manufactured by man.

At the present time much effort and study is devoted to the strength of structural materials. Great results have been achieved in the case of steel by the introduction of other types of metallic elements in the chemical composition. By such means the strength of steel has been greatly augmented. These results, however, are trivial when compared with the achievements of Nature. The cells of almost every vegetable are provided with membranes capable of withstanding pressures 25 times those safely resisted by the highest grade of boiler plate when the relative thickness is considered in the comparison.

Power plant designers should study the perfect power plant of the *Marchanita Moss* whose efficiency far exceeds that of the greatest power installations of modern engineering.

The modern scientist prides himself upon his instruments of precision. Here again Nature is far superior in its products. Both plants and animals are provided with instruments and devices whose sensibility is far higher than the most perfect scientific device known. The weather plant *Abrus Praecatoris*, found in the West Indies, is highly sensitive to changes in atmospheric pressure. The little weather bug *Copris Carlina* is sensitive to electric waves transmitted from thunder storms hundreds of miles distant.

Biotechnics will prove a troublesome science for the materialist who believes that our universe is the result of mere chance and that purposeful reason is absent in the cosmos.

BRIEFLY TOLD

British India raises nearly 2,000,000 acres of peanuts each year.

A new smokeless railroad locomotive has been invented by a Russian in Berlin. The new engine has no smoke stack and looks like an ordinary baggage car. The inventor says his invention will make it possible to build railroads in the Sahara Desert and other great stretches where water is not found.

The names of towns and villages will be painted on roof-tops in Pennsylvania, Maryland and Virginia, as an aid to airmen flying over the country.

The picturesque King's Arms Inn at Eltham, England, reputed to be 700 years old, and in past times a favorite stopping place of Dick Turpin and other highwaymen, was closed recently to make way for a modern inn of the same name close by.

Diamonds have been discovered in Dutch Guiana at Brownsweig, about 80 miles from Paramaribo. The district has yielded gold for 47 years. As the place is easily reached by railroad from Paramaribo a rush of diamond seekers is expected.

In his speech at Christiania accepting the Nobel Peace Prize, Fridtjof Nansen said, "War is and will ever be negative, destructive; it can never bring aught but evil in its train. We are on the road back to barbarism. Anyone who has traveled throughout Thrace and seen the whole population out on the roads with their property must inevitably feel himself back again in the days of the great migrations. What humanity needs now is self-sacrificing active altruism which is able not only to give, but also to give up."

Farming taught by mail is one of the important features of the work of the College of Agriculture at Ohio State University. Every phase of agriculture is covered in the courses.

The water supply of Fort William, Ontario, was too pure, which is something new in municipal experience. The water had no sediment formation when put in the tanks, and the linings of the tanks were exposed to the full oxidizing influence of aërated water. To offset this the city chemist was compelled to add lime to the water.

Herring fishermen at sea off the Swedish coast are told the exact location of the herring schools by wireless from the Gothenburg radio station. This eliminates wasteful waiting on the part of the fishermen.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Lignite coal is being mined in a commercial way near Shaunavon, Saskatchewan. The White Mud Valley is underlaid with coal with outcroppings so near the surface in places that ranchers have for years been hauling their fuel from holes dug in the banks.

If the killing of whales continues at the present rate, within a few years the earth's largest animal will be extinct, according to the director of Natural History of the British Museum. The seal rookeries on the Pribilof Islands, protected by armed guards in the employ of the United States, have grown from 215,738 seals in 1912 to 581,453 in 1921.

An all-steel grandstand has been built for the State University of Iowa. If properly painted it will last for an indefinite period.

Two hundred thousand dollars has been provided for the erection of a summer White House for use of the President in the will of a Baltimore lawyer. The site is to be within automobiling distance of Washington. If the offer is not accepted by Congress within 12 months the money will revert to the estate.

During a heavy fog persons in Western Pennsylvania saw in the center of the sun a small round black dot. Astronomers of the Allegheny observatory said it was a new group of sun spots, made visible to the naked eye because of the dense fog which acted much like a smoked glass. The sun appeared like a great copper disc with the spot plainly visible.

What is believed to be the oldest cat in the United States recently died in Billings, Montana, at 24 years and three months.

One thousand reindeer carcasses recently arrived in Vancouver, British Columbia, from Alaska and Northern Canada. They are being shipped to New York and other eastern cities. There are more than 100,000 reindeer in Alaska and similar shipments will be made in the future.

For part of its water supply Athens, Greece, depends on the aqueduct built by the Roman Emperor Hadrian.

Two boys have left Weiser, Idaho, to ride the treacherous waters and rapids of the Snake River to Lewiston. They expect to make the trip safely in a new boat built especially for the occasion. The distance is 222 miles and the river runs through one of the deepest and mightiest gorges to be found in the West, cutting its way through several mountain ranges between canyon walls 7,000 feet deep in places.

More than $500,000 in bonus checks was given as Christmas presents to those employes of the Baltimore & Ohio Railroad who remained loyal to the road during the recent railroad strike.

Commercial radio communication between China and the United States has been established. A station at Hillsboro, Oregon, working on 8,400 meters, is being heard regularly at Shanghai where the Federal Telegraph Company has erected an experimental station.

The only fox farm in Great Britain is located near Alness, Cromarty Firth, Ross-shire, Scotland. The climate is suitable and the first six have increased to 60.

Well diggers in the Caribou District of British Columbia threw up fine nuggets and sand impregnated with gold while digging a well in search for good cattle water. The gold-bearing sands extend over a large area.

In an Egyptian tomb a vase was found containing honey still liquid after 30 centuries. Cushions on the armchairs found in this tomb were still so soft and well preserved that one could toss them across the room without doing them damage.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

Chicago Shocked By Inquiry Truths

Robbed by Useless Styles

What's So About Evolution

"Pitiless Publicity" Is Pitiful

The Trysting Place of Poe

CHRONICLER OF THE NEGLECTED TRUTH

Robbed by Thousands of Useless Styles

Bricks in 66 Styles—American Flags in 300 Styles—Your Choice of 6,964 Styles of Axes—Hundreds of Styles of Shoes

By AARON HARDY ULM

"WHY, think of how they used to bind the feet of their girl children!"

How often have you heard that as an argument, expressed or implied, that the American, who thinks that he lets his own and his women's feet "grow wild," necessarily is much superior to the "heathen Chinee."

But, says an authority on the subject, what Americans have permitted to be done to their own feet, and even more so to their women's is, on the whole, far worse than the once but now abandoned foot-binding custom in China. For foot-binding with all of its exquisite absurdity and cruelty affected only a comparatively few Chinese. Our treatment of our own feet affect virtually all who wear shoes.

And our treatment has caused far greater discomfort and personal inefficiency, and an economic waste more considerable than that produced by foot-binding in China.

"The American foot has been peculiarly the plaything of those who make and sell shoes," declares the aforementioned authority. "In a period of a single generation they do all manner of things to it—change the toes to the right and then to the left, then let them grow forward but cramped for awhile and then freely; they bear down on the instep and then let up on it and squeeze the heel. If an average adult American could see a motion picture that would display the changes made in his own foot by the ever-occurring variations which have taken place in the designs and 'styles' of shoes, he no longer would feel superior to the Chinese in the matter of foot sense."

Shoe Waste Terrific

THE man who thus spoke is a specialist in the Bureau of Foreign and Domestic Commerce, United States Department of Commerce. Neither he nor his establishment is interested particularly in your foot or my foot. Either of us, as far as he is concerned, can do what we please with our pedal extremities. Nor is he an orthopedic expert, a professional largely the result of the conditions which the trade specialist mentions.

That trade specialist is interested only in saving shoe money for you; that your foot also would be conserved is a merely incidental equation.

For shoe waste inevitably involves foot waste. And shoe waste is one of the biggest economic vices of which as a nation we are guilty.

This waste isn't owing to any notable falling off in the lasting qualities of shoes produced and marketed in America. In fact, in that sense shoes steadily have grown better, as primary manufacturing of shoes has improved—even to the point whereby we are the most efficient shoemakers in the world.

The waste is due to something else than the lack of efficient shoemaking machinery and processes.

It is due chiefly to the inordinate variations in types, designs, styles, and in the exorbitant changes of them that ever are taking place in the realm of shoe manufacturing and distribution—all made ostensibly in an effort to sell more shoes than the people need or want.

Those variations and changes have not had to do only with the esthetic side of shoes; they have had to do almost as much with the dimensions, which, under no sane arrangement, can be dependent on taste; it is a matter solely of foot size, build and need—which belong to Nature and not Art.

"There probably are several hundred more designs and styles of shoes than there is any need whatever for," says the same specialist.

The economic result is a 25 to 50 per cent needless waste in shoemaking and distribution. Designs limited only to actual need, which can be determined scientifically as has been repeatedly demonstrated, would cut the national shoe bill at least one-fourth, even without restriction put on those factors having to do with external beauty. All that is necessary for that to be done is for the shoe manufacturers to agree to produce shoes of only certain standard dimensions, the same to be subject to change only by concerted action as experience and demonstrated foot need would require. This would simplify manufacture and distribution and assure to the American foot relief from the strain put upon it by the ever-changing shape of shoes.

All Industries Guilty

WHILE the shoe industry is a glaring one it is not the worst waster. Virtually every industry is guilty, with the result that while we have, primarily, the most efficient primary production in all the world our system of distribution is the costliest and most wasteful ever known. And the cost and waste, despite many contrary cases mostly of an individual kind, steadily are growing, with an ever-widening margin or "spread" between what the producer of the raw product receives and the ultimate consumer pays. The Joint Committee of Congress which lately spent two years investigating the subject (and whose findings every American should read) reported that *distribution of finished product now costs more than the production of raw material and its manufacture combined.*

And a great proportion of that cost is attributable to the lack of standardization which easily could be applied. The promotion of standardization, to reduce cost and improve product, has been undertaken on a big scale by the United States Department of Commerce.

No effort is being made to force it; in fact, barring a few cases, there are no national standardization laws—not even any regulating such things as scales and common measures—although they are authorized by the Constitution.

The Department of Commerce is not asking for any laws on the subject; it merely is appealing directly to the managers and owners of the industries themselves. And in several cases there already has been noteworthy success.

Take paving bricks, as an example. Evolution long ago reduced building bricks to a few designs. Yet it would seem that there would be more need for a large variety of building bricks than for those used in paving. But it was found that not fewer than 66 different kinds of paving bricks were being made and sold. With the vast majority the variations consisted of nothing more than slight singularities which served no purpose other than to give "talking points" to salesmen. But they caused great waste in manufacture and distribution and put a handicap on paving brick makers in meeting the competition of other paving materials. So they got together and discovered that every paving-brick need could be met though only 11 kinds were produced. Those 11 proved to be too many; and the number later was reduced to six!

It is quite a leap from paving material to the national emblem; but in the case of the United States flag you find a veritably irreverent case of excess variations in type and design.

Why, of all things, the Stars and Stripes are standardized, fixed, invariable, you say. But, excepting as to number of stars and stripes and elemental color arrangement, the American flag is not standardized.

In 1912 the government itself introduced a measure of uniformity with regard to its own flags. An executive order established 60-odd sizes and types for use by the departments of the government. There was a revision in 1916 when the authorized number was reduced to 12. Yet only recently it was found that a single flag manufacturer listed in his catalog 88 different sizes in 17 qualities and grades and from one to nine styles in each grade. *And not one of them conformed to the government's specifications!* At a conference of manufacturers it was disclosed that all told more than 300 kinds of American flags, differing not only as to size and material but also as to relative dimensions of the parts and sections, were being made and sold. At the behest of the Department of Commerce a study now is being made whereby it is expected that the number will be reduced by agreement to a score or more, each to be defined on sound principles of art and economy. The economic saving will not be large but the dignity thus added to the national emblem will be great.

The Making of Beds

LET'S go from flags to beds. You may think that the term "full-sized bedstead" means something. But in purchasing a bed by that specification alone you may risk uncertainty as to a foot or more of its width and length. Until lately there was infinite variation in the basic dimensions of all "sized" bedsteads, "full," "three-quarters" or "single." The trade terms had ceased to carry any well-defined meaning. When the manufacturers were told that they would do more business and with greater profit if they agreed among themselves on a few standardized dimensions and tolerated no other unless or until there was real need for a change, the reply made substantially was as follows:

"You will wreck our business, the life of which is style and the life of style is change. If you standardize furniture you make progress, both in the direction of beauty and convenience, impossible."

"But furniture, beds in particular, are made for human beings who are fairly well standardized as to dimensions," they were told. "A few bed sizes will meet every ordinary human need. The rare exceptions, like giants, must have special beds made anyway. Stop trying to make your furniture different merely by freakish changes in dimensions and you will have more time to concentrate on genuine artistry and workmanship."

The manufacturers have agreed to limit output of beds, springs and mattresses to about 14 dimensional designs. So long as the dimensions are held to, one may go as far as one wishes in the matter of "style." The move means tremendous savings to the springs and mattress industries, which heretofore had to be making constant adjustments to meet changes made by the bed makers. The result was terrific waste.

It is not a far leap from bedsteads to lumber, often intrinsically the same thing. Though lumber is one of the oldest and most used of manufactured products one who deals in it extensively must know what is tantamount to being another language. Many of the simplest and clearest trade terms having to do with lumber mean many different things and rarely the one which the words themselves convey.

Take a 2 x 4 board—there are at least 15 different sets of dimensions, scarcely any actually 2 by 4 inches, for that single item of lumber in actual trade. For white pine lumber there are 30-odd accepted trade names in use. A 1-inch plank, so-called, may vary anywhere from 5/8 to 15/16 of an inch in thickness, depending upon factors all of which are known only to the highly expert.

The National Lumber Manufacturers' Association is now developing a scheme of standardized trade terms which will mean what they say and will be uniform.

It is in the realm of simple mechanical implements that you find that most absurd elaboration of varieties.

It is difficult to understand how use can be found for, say, more than 25 different kinds of axes. Yet, according to William A. Durgin, Chief of the Division of Simplified Practice in the Department of Commerce, one "manufacturer carries through all his card records, his shop accounts, his salesman's equipment and every detail of his business, varieties, sizes, brands and finishes, presenting axes to the careful buyer in the number of 6,964"!

It would be hard to find a single hunter who ever used more than a dozen different varieties of shells for guns. Yet the National Hardware Association found that there were on sale in this country not fewer than 7,362 varieties.

"Sizes?" Don't Mean a Thing

AND so it goes with virtually everything. A manufacturer hits upon a convenient trade term and adheres to its meaning. Another comes in and to undersell trims the article here and there, or changes its fundamentals, and offers it for less under that trade term. Then in a little while the trade term comes to mean little or nothing and is made to cover endless and largely useless varieties of things that if standardized in fundamental particulars could be produced and distributed much more cheaply.

There's boys' suits, as an example. There may have been a time when a six-year suit fitted the average six-year-old boy. Now it is said that the average six-year-old boy generally needs an eight-year suit, not because the boy is larger—as fond mother is prone to think—but because the suit has shrunken. The term "six-year boys' suit" could be made to mean certain fixed dimensions just as men's collars and the neckbands of their shirts are now numbered with almost perfect accuracy no matter by whom or in what general style made. Variation there would react quickly and with vigor; therefore absolute standardization as to neck dimensions prevails.

Likewise in most mechanical realms standardization or simplified practice tends to develop through public demand. But only in a few instances has it ever reached anything like the easily possible. A big manufacturer of farm machinery was astonished on learning that 30 wrenches, each with as many grips as a wrench could carry, were necessary to turn all the bolts on the several implements he made. A few experiments proved that, by using bolts of more uniform size but just as capable, four wrenches would be sufficient for everything. In thus simplifying his practice he not only made it easier for the farmer to adjust one of the implements but the cost of manufacture was reduced materially.

And, say specialists in the United States Department of Commerce, like simplicities can take the place of complexities in virtually every industry and without any loss to art or the hampering of progress.

Would Save Billions

"THE consequent saving," says Herbert Hoover, "would be interpreted not into millions but into billions of dollars."

"If there were no other reason for immediately attacking this problem," says R. M. Hudson, an expert industrialist in the simplified practice division of the Department of Commerce, "the activity of foreign countries would be sufficient. Eleven European nations are applying standardization, so are Japan and Canada. Only recently the London *Times* said editorially that it seems certain that industrial supremacy in the future will depend very largely on the simplification of manufacturing processes to avoid waste."

Only a year ago the American Engineering Council surveyed waste in industry. Six major industries were studied. Waste was determined by the difference between the average and the best practice then existing in each industry. It found that it amounted to 28 per cent in the metal trades, to 64 per cent in the men's clothing manufacturing, or an average of about 40 per cent for all industries surveyed. And one of the chief causes was the lack of standardization of materials, of finished product, of the performance of labor, and other things which might be made amenable to a fixed and efficient rule.

It is the hope of the present conductors of the Department of Commerce that much of that waste soon will be overcome, not by legal force or other arbitrary measure, but through voluntary and co-operative action of the industries themselves.

But to achieve it they must have the support of the public, which now pays ultimately for the wasteful practices that generally prevail.

Yes, Chicago IS Shocked by Appalling Story of Alien Syndicate-control of Protected Vice

The Horror That Mantled Our Second City When Grand Jury Revelations Told of a Slavery Undreamed of, of an Industry Whose Toll Was Millions

By ALFRED BUCKNER

THRICE rewritten, what you read here—in the effort to put before decent people something almost inherently impossible for them to grasp. Yet even the original report was a mere side glance at the Social Abyss. Imagine some tortured spirit lighting a match in the bottomless pit. Only a fitful flash, a feeble spurt of flame in the primeval DARK. Just one fleeting eyefull of racial degeneracy flowing torrentially through the sewers that carry off the scum of the Melting Pot.

The death gasps of a political machine have started a strange clatter of echoes in the vasty deep of the Chicago underworld. A grand jury is probing vice. Nothing very extraordinary about that. They always probe vice before election in American cities. All political gangs finally swell up with their putrid prosperity until they die of rotten gluttony. Eight years is their usual cycle of dominance and the present Chicago gang have lived their appointed time, and are now about to be succeeded by another outfit—who in time will—but why waste good linotype metal in prophecy. They were artisans, their opponents are said to be artists.

* * *

But for all that, Chicago is SHOCKED. Folks who read the *Tribune*, and there are a lot of them, now know at least a part of "What Every Police Reporter Knows —*and Doesn't Write.*"

May Be Turning Point

THE same day that THE DEARBORN INDEPENDENT hit the news stands of the Loop carrying the story bearing that title, which intimated that there are racial factors in the vice problem, and that there is a relentless pursuit of the white woman in the cities of America, the Chicago *Tribune* reached the pinnacle of newspaper frankness. It carried a story on the vice investigation which confirmed everything that THE DEARBORN INDEPENDENT's story intimated—it carried details up to the very limits of the postal laws.

If the *Tribune's* lead is followed up, what promises otherwise to be an ordinary "vice probe" of which America is cynically weary, MAY prove a turning point in the social history of this country.

Such is the explosive power of truth.

But there is only too much reason to fear that no such result will follow. One column and a half of truth, plus a rather curt editorial threat *to hold the higher-ups responsible,* was enough. With a crash the already shaken political machine began to fall to pieces —the rats began to run and a powerful motive back of the probe began to wither up. Still, something has been started. *Maybe "they" can't stop it.*

* * *

The *Tribune* said in substance that more than 1,000 white girls are held enslaved in Chicago by Negroes. (These girls, it must be said, were not taken by Negroes, they were given to Negroes by members of another race.) Here's something the *Tribune* did not say, however. The majority of the Negroes now in charge of the vice traffic in Chicago are either working for a syndicate composed of men of other races, or learned their trade from such people.

The Names That Crop Up

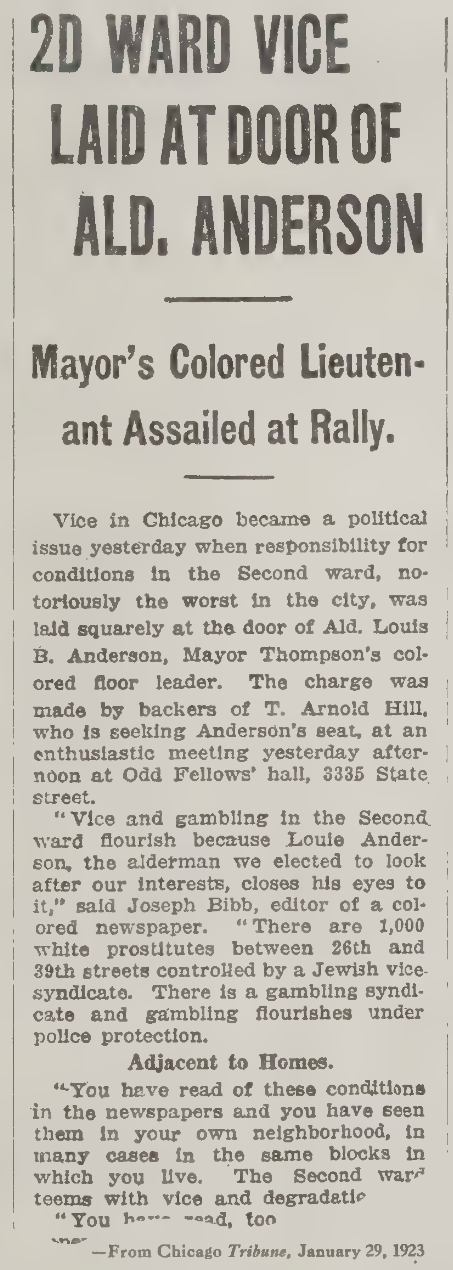
IN NOT stressing this point the *Tribune,* for the most of its 75 years an ardent champion of the colored people, appears to a rank outsider to have overlooked a bet. Most criminologists and newspaper men have long noted that back of nearly every Negro crime there is a white man of some sort—a dive keeper, fence or gaming promoter. The South long ago learned this, and that's why the South went dry—it found the alien gin peddler with his obscene labels and advertising back of many an outrage that sent some Negro to the noose or stake.

Strangely enough the names of the manufacturers of "nigger gin" which *Collier's Weekly* blazoned to America some years ago are racially akin, and remind one forcibly of names which keep cropping up in the present Chicago vice investigation.

Take a look at this list—composed of individuals who have appeared in the reports as vice district politicians, legislative representatives of vice-infested districts, professional bondsmen, attorneys always at the bar for arrested vice mongers, and so on. None of these men have yet been proved to have profited from vice, none at this writing has been indicted, all may be innocent, but their names appear when the vice problem stirs the courts or breaks into the newspapers.

Al Cohen, Dr. Rosenberg, Nate DeLue,
Buddy Stuss, Sam Cohn, Joe Kostner,
Joe Blue, Ike Roderick, Jack Guzick,
H. Meneley, Joe Ginsberg, Johnny Torrio,
Louie Weiss, Jack Zuta, Dave Blumenfield,
"Lovin' Puddy" Annixter, Solomon Van Pragg,
Morris Isadore Green, "Jew Louie" Gersetal,
"Jew Joe" Grabiner, Milkie and Hymie Levins,
State Senator Adolph Marks,
"Jew Izzie" (last name unknown),
"The Jew Kid" (last name unknown).

An anti-Semitic list? Not if you take a look at them. There is hardly a Semitic skull or face in the crowd—they all reek of the Mediterranean, the Balkans, Poland or the Pale. If supersensitive Israelites choose to call them Jews—let them claim them. This writer must confess candidly that they do not fit his conception of the Jew—ethnologically or otherwise—but one thing is sure—most of them are not our kind of folks—not "white men" as Americans use the term.



2D WARD VICE LAID AT DOOR OF ALD. ANDERSON

Mayor's Colored Lieutenant Assailed at Rally.

Vice in Chicago became a political issue yesterday when responsibility for conditions in the Second ward, notoriously the worst in the city, was laid squarely at the door of Ald. Louis B. Anderson, Mayor Thompson's colored floor leader. The charge was made by backers of T. Arnold Hill, who is seeking Anderson's seat, at an enthusiastic meeting yesterday afternoon at Odd Fellows' hall, 3335 State street.

"Vice and gambling in the Second ward flourish because Louie Anderson, the alderman we elected to look after our interests, closes his eyes to it," said Joseph Bibb, editor of a colored newspaper. "There are 1,000 white prostitutes between 26th and 39th streets controlled by a Jewish vice syndicate. There is a gambling syndicate and gambling flourishes under police protection.

Adjacent to Homes.

"You have read of these conditions in the newspapers and you have seen them in your own neighborhood, in many cases in the same blocks in which you live. The Second war teems with vice and degradati

"You [illegible], too

—From Chicago *Tribune,* January 29, 1923

There are Anglo-Saxon names in the testimony before the grand jury and the news reports of the investigation, but the bulk of these names are borne by Negroes, with here and there an owner of real estate rented for vice purposes.

100,000 Persons to Leave City

CELTIC names are almost entirely confined to policemen who seem to have played their part of "harness bulls" with so much realism that they wore blinders too—with here and there a politician or liquor seller—and then you never can tell whether the name was inherited or "adopted."

The group of alien degenerates and Negro criminals who have built up the present vice syndicate in Chicago has proved that even the "oldest profession in the world" can be modernized, placed on an "efficiency" basis.

The revelations in the reports of investigators can hardly be matched in the pages of Martial, Juvenal or even the mural decorations from the Pompeian resorts, which came to light after 1900 years under the Vesuvian ashes to tell one reason at least why the Roman Empire was depopulated. By masterful detours of language the Chicago *Tribune* managed to convey to its sophisticated readers some idea of these iniquities, but the present writer will not attempt to compete with the *Trib's* bright young men. They ought to have their salaries raised. They did it, with the maximum of clarity and the minimum of offense.

Some real estate men say that probably 100,000 respectable citizens are preparing to leave Chicago in the spring because they fear to attempt the task of rearing their children within reach of the syndicate's polluting influence. The suburbs are rocked with scandals among high school children, which trace back to the twin influences of the vice Camorra, and its able if unconscious allies—Chicago's 'intelligentsia," who have been producing such "devastating" books that already rumors are abroad that a proper probe among some of the younger Chicago literati would unearth the same sort of thing that wrecked the "aesthetes" in London back in the "nineties."

The syndicate is estimated to be cleaning up around $10,000,000 a year. It takes half of the earnings of its victims for the higher-ups alone, and under its intensive methods a single girl victim has been known to have taken in thousands in a few months. One man is said to have "earned" a million in recent months and another prominently placed politician has made $75,000 bank deposits at rather regular intervals.

There are more than 200 known resorts in Chicago conducted on "business principles." Usually the resident manager or proprietor on the South Side is a Negro—on the West Side some alien who a few years ago was in Eastern Europe unable to speak a word of English.

A System Is Perfected

THERE are some solid blocks of dives and dozens of so-called hotels whose principal guests are women installed there by agents of the syndicate and watched over and promoted by these same men—the class known as lounge lizards in the gilded cabarets of Broadway, but called by the shorter and uglier word in the rest of the English speaking world.

Most of these women are managed by Negroes, but back of the Negro there is the syndicate.

Officially the vice district of Chicago has been purely historical for many years and lots of good folk all over this broad land have pointed to its elimination as one of the milestones of American reform. But the old district was a veritable "Main Street" compared to the modern "system" which is not even officially supposed to exist.

State's Attorney Weyman cleaned out the old Levee in 24 hours. Every resort was closed, every inmate and male parasite driven out of town or into honest work. This one-day job ended the old district FOREVER, but officials say that the police cannot cope with the present situation.

For a long time Chicago was relatively free of commercialized and syndicated vice. The commercial exploitation of human weakness almost ceased.

Then vice began to come back. Its return was coincident with the sensational invasion of South Chicago by Negroes in the early days of the European war. The confusion in community affairs and the political chaos resulting from the displacement of the white residents by the newcomers created the conditions under which it was easy for the vice power to grow up.

Real Estate to Negroes

JULIUS ROSENWALD, president of Sears, Roebuck & Company, and one of the wealthiest men in America, is credited with encouraging the Negro exodus to Chicago. There would have been a heavy movement no doubt without any encouragement other than economic conditions. That occurred elsewhere. But nowhere were the newcomers so enthusiastically welcomed and made "at home" as on Chicago's South Side.

Jewish real estate agents bought up block after block of residential property occupied before by white citizens of long standing and installed Negro residents. The newcomers covered Grand Boulevard, Prairie avenue and similar streets, only a short time before the residential quarters of such people as the Armours, Pullmans and others whose names are synonymous with the building of the second city of America. Leaders of the migration extended their lines farther and farther—going to Rosenwald for help. They were sold $5,000 pieces of property on an initial payment of $50 and permitted to move in after making the first payment. This practice and the losses of older owners were one of the causes of the race riot which flamed out in 1919—*although there were clear indications that Bolshevik propaganda inspired from New York's East Side had a share in the catastrophe.*

For a while after the riot the tide of dispossession that had been rolling out the original white home-owners was stilled, but it began to flow again and there are indications that it had strong financial support from Jewish men of wealth. The Negroes were encouraged from some quarter anyhow to go into politics. Soon their lower elements were prominent in crime and vice. By this time they had complete control of what had been one of the best residential sections of Chicago and while many of the better Negroes who had moved in struggled against the degradation of the district, it began to take on an entirely new tone.

Resorts, cabarets, cafés, saloons, gaming dens and vice houses were opened up. Soon the district was notorious for its "black and tan" cabarets, where white women, many voluntarily degraded, but many forced into such a life originally, were to be seen nightly danc-

Our Lost Freedom

THE attempt to curb free speech in America is one of the important signs of the times. We have reached that period in degeneracy when the honest word is feared and suppressed. There are doubtless sufficient reasons for this: nothing exists otherwise; and one of the reasons may be that as a people we have so far forgotten how to think, as to have lost our right to our ancient liberty of expression. The loss of it, however, is better calculated than anything could be to make us think again. We are in a period of world illness where only clear seeing will avail, and one of the things we must see is the gradual closing of the net, spread by divers interests, upon free speech.

Readers are recommended to peruse in the January *Harper's Magazine* the article by Katherine Fullerton Gerould on "Freedom in 'The Land of the Free.'" Mrs. Gerould did not understand what had happened to the United States until she went to Canada, where they have full British liberty without American disorder and license and suppression. In writing the essay, Mrs. Gerould expresses doubt that any editor could be found to print it, but as *Harper's* makes it the leading article for the month, congratulations are due to the author, the magazine and the public. Mrs. Gerould mentions the fact that a minister of the Canadian Government could actually say in public that while Canada frankly wants immigrants more than anything else they want no immigrants save those that are "British, white and Christian." Mrs. Gerould then tries to imagine Mr. Hoover or Mr. Hughes saying such a thing, that is, being free enough to say such a thing here. (Our imagination sticks at Mr. Hoover saying anything!)

Mrs. Gerould says that in the United States we have developed mobs of opinion whose business is to suppress all other mobs of opinion, so that we have reached a state in this country where to say anything at all is to arouse the attack of a mob of opinion organized to suppress any mention of that thing. She says "you do not have to credit the authenticity of the Protocols to realize that few forums are open to the man who believes in a Jewish peril. . . . The point is this: that, while you and I may be personally safe, we keep our safety only by avoiding certain subjects. No thinking citizen, I venture to say, can express, in freedom, more than a part of his honest convictions . . . . On every hand free speech is choked off in one direction or another. The only way in which an American citizen who is really interested in all the social and political problems of the country can preserve any freedom of expression, is to choose the mob that is most sympathetic to him, and abide under the shadow of that mob. At that, he will have to hold his tongue a great deal."

This essay should be read in every men's club and studied in every reading circle and advertised in every newspaper, that Americans may be roused to reclaim a heritage which is surely slipping away from them.

The Chicago Disclosures

CHICAGO is undergoing exposure, not of the natural weaknesses incident to human nature, but to the calculated crime of those who make the sins of others their business and commerce. It is to be hoped that the real Chicago—not the Political Chicago, nor the Newspaper Chicago—will rouse itself to the effort of making the exposure complete. Exposure is a thoroughly cleansing agency in itself.

Not for the sake of "getting" any individual, and certainly not for the sake of using public indignation as a lever for dislodging one set of officeholders to seat another set of office seekers, but for the sake of fumigating the life of all our big cities, the exposure must be complete.

There is danger just at this writing that, in return for an orderly retreat and enough martyrs to save the "men higher up," the attack will cease. That is, such an attack need not have as its motive the good of the city, but the discomfiture of political enemies. In this kind of an attack the desire is not to end the conditions themselves, but to dislodge those who are at present profiting by the conditions. Chicago must prevent such an abuse of public power and public opinion.

The Negroes of Chicago are to be congratulated on the forthright manner in which they have met their responsibility in the matter. The Negroes are very far from being the most culpable element in Chicago's shame; from information at hand it is even possible to say that they have shown themselves to be least culpable of all; but this they have done—recognizing the racial elements involved they have taken up their own racial duties in a direct and manful manner. The Negro refuses to stand behind the Negro who besmirches the name of his race.

Let the Chicago Jew do likewise. In Chicago, as in every city in the land, the vice monopoly is owned and operated by Jews. Prostitution is a Jewish commercial operation throughout the world. Not that all the Jewish people are involved—not by any manner of means—but most of those involved are Jews. And Jews have always defended their people thus engaged. The New York Kehillah was organized in just such an exposure as is now taking place in Chicago. If Chicago Jews will show the good sense of the Chicago Negro and pronounce their racial anathema upon those Jews who have besmirched the name of Jew, it will mark a forward and hopeful step in the history of the Jews in America. Chicago presents an opportunity to take advantage of which the Jews would be well advised.

Propagandizing the People

IF THE readers of newspapers and magazines could realize the source of much that is offered them in the line of educational discussion, and the impossibility of securing through the same channels any opposing argument, there would be a better understanding of economics in the country.

The *Atlantic Monthly* nearly a year ago published a long article intended to show the absolute necessity of the gold standard in money, written by a professed financial expert, in which the views of several who oppose the idea were presented, but so colored as to give a false impression. One of the ablest writers in the West, whose name the author had used, tendered a reply in which he categorically controverted every misstatement, and there were many. The magazine editor declined to use it, claiming that the original article was "orthodox" and beyond controversy.

The same author has recently furnished the *Saturday Evening Post* a rehash of his argument for gold, its chief feature being the omission of reference to the theory of the western writer. Another western writer, however, offered to refute the pleas of the expert in much less space, but was courteously told his effort would not receive attention.

And in these two incidents there arises a little history which may be of interest.

Two years ago this advocate of gold, as manager of a "foundation," privately endowed, conducted an "economic research," and offered substantial cash prizes for competing essays on economic subjects, among them that of the function of money. Many essays were submitted, prizes were awarded, and the result announced. So far as it is possible to learn, none of the essayists has received reprints of the meritorious papers, which were promised, nor has the press announced their publication. Within a short time, however, each has been circularized by a publication society bearing the same name as the "foundation," offering several volumes on his side of the money question, written by himself and others recognized among the judges in the "contest."

The money propaganda arises in a source that will deny so far as possible any free discussion. It is practically useless to answer to different audiences, and debate is necessarily checked if publicity can be controlled; and publicity is controlled in every case where one side of a controversy is barred from a hearing.

In the above cases, the monthly magazine, the weekly magazine and the daily newspaper, have deliberately cheated their readers of opportunity to learn the opposing argument without seeking it in other quarters. As a matter of fact their readers are going to other quarters, and their going means a tremendous let-down in public confidence in the press.

My Duties as a Citizen

JOHN GARLAND POLLARD, of the faculty of the College of William and Mary, of Virginia, has forwarded a copy of the 'William and Mary Citizenship Creed" formulated by the students in the classes of Virginia Government and Citizenship with the advice and help of leading statesmen and scholars throughout the country.

WILLIAM AND MARY CITIZENSHIP CREED
1922

We, the members of the classes in Virginia Government and Citizenship of the Marshall-Wythe School of Government and Citizenship, of the College of William and Mary, at Williamsburg, Virginia . . . . do declare that . . . . the following is a summary of our conception of our duties as citizens to the governments under which we live:

MY DUTIES AS A CITIZEN

I.

To acquaint myself with those fundamental principles embodied in our constitutions and laws which experience has shown are essential to the preservation of our liberties and the promotion of good government, and to defend those principles against all attacks.

II.

To inform myself on all public issues, and on the character, record and platform of all candidates for office, and to exert actively my influence in favor of men and measures in which I believe.

III.

To vote in every election, primary and general, never using my vote for personal or private ends, but only for the public good, placing the welfare of my country above that of my party, if the interests of the two should ever conflict.

IV.

To connect myself with the political party which most nearly represents my views on public questions, and to exert my influence within the party to bring about the nomination of good men for office and the endorsement of measures for the public weal.

V.

To have the courage to perform my duties as a citizen regardless of the effect upon me financially or socially, remembering that a cowardly citizen is as useless to his country in time of peace as a cowardly soldier is in time of war.

VI.

To stand for honest election laws impartially administered.

VII.

To obey all laws whether I deem them wise or not, and to uphold the officers in the enforcement of the law.

VIII.

To make full and honest returns of all my property and income for taxation.

IX.

To be ever ready to serve my country in war, and in peace, especially in such inconspicuous capacities as juror and election official.

X.

To acquaint myself with the functions of the various departments of my government and to spread the knowledge of the same among my fellow citizens in order that they may enjoy to the fullest extent the advantages offered by the government, and may more fully recognize the government as a means of service to the people.

XI.

To encourage good men to enter public service and remain therein by commending the faithful performance of their duties and by refraining from criticism except such as is founded on a knowledge of facts.

XII.

To seek to promote good feeling between all groups of my fellow citizens and to resist as inimical to public welfare all partisan efforts to excite race, religious, class and sectional prejudice.

XIII.

Not to think alone of what my government can do for me but more about what I can do for it.

XIV.

To inform myself with respect to the problems which confront my country in its foreign relations, and to support policies which safeguard its legitimate interests abroad and which recognize the responsibilities of the United States as a member of international society.

Mr. Ford's Page

THERE are people who delight to make life appear as a struggle, and it is noticeable that those who talk most of life as a struggle have the easiest time; it is a mere word fashion they fall into. Then sometimes life is described as a battle, which is a point of view readily adopted by those who wish to draw a veil over their own brutality. There are people who do not know how to do things other than in a brutal way, they have not learned that the same end can be achieved by helping as by hurting the other man, and these are the people who soothe their consciences by referring to life as a battle.

Life is a job. The competition involved arises from the different degrees of interest which men put into their job. The man who competes with the sole idea of competition does not get very far. Competition itself is not a sufficient motive to carry a man along. The only dangerous competitor is not the man who covets what you have and who tries to dispossess you; the most dangerous competitor is the man who doesn't bother about you at all, but goes on with his own business while you may be loafing in yours.

> *COMPETITION whose motive is merely to compete, to drive some other fellow out, never carries very far. The competitor to be feared is one who never bothers about you at all but goes on making his own business better all the time. Businesses that grow by development and improvement do not die. But when a business ceases to be creative and becomes merely reproductive, that is, when it believes it has reached perfection and needs to do nothing but produce—no improvement, no development—it is done. The competition of life, motion, growth will overcome it. That is why Finance and Government are falling in public esteem—they have not grown in power to render service at decreased cost and risk. The Competition of life, motion, growth, is putting them behind.*

The germ of absentee landlordism, or of absentee dividend drawing, is in most people. That is, having done a thing, they wish it to pay returns to them forever. They wish to turn it over as a finished work, dismiss it from their minds, and draw unending reward from the copyright. Having made one heave on the rope, they wish to live on the credit of it for the rest of their lives.

Well, very few ever succeed in having that sort of a dream come true, and when it does it is greatly to their hurt. Life is so arranged that this is not possible. Life being a job, and the main job, ways and means are contrived to keep man working at it, if not for themselves then on someone else's job. Because there are no "lucky strikes" that reward us with a life of indolence and ease, and there is no good work so well done that it cannot be bettered, we are constantly kept on our mettle. The element which we call competition is just this proof which life is always giving us that work is in need of always being bettered.

It is within a man's right to quit, to withdraw himself from the work of the world, but it is within no man's right to quit and expect the thing quitted to revolve around the motive of providing him with reward.

One of the secrets—a simple secret, and thus easily overlooked—is to regard the motive for life not as reproduction but as improvement. The story is well known that Thoreau made a lead pencil and then refused to manufacture pencils; he said he did not wish to devote his life merely to reproducing himself in lead pencils. Apparently the thought of improvement did not occur to him. He was right in so far as he refused to run his whole life into one lead pencil mold, but there was a considerable field which he did not see, as subsequent improvements of our writing utensils show.

Most businesses fail because, having done something, having invented something, having discovered something, having contrived something that will work up to a certain point and serve up to a certain degree, they stop right there; they invent nothing to improve their invention; they discover nothing to enlarge the usefulness of their discovery; they toil no longer to make the workability of their product more dependable, or their service more various or less costly. Having done one thing they stop.

Now that is a fatal course to take. It neglects improvement and gives itself over to reproduction. Anyone who would be of wide service in this generation must necessarily think of production. There are so many people waiting for the useful commodity that even to supply them once around takes a great production. And thus production is necessary to service. But there is something before production—there is creation. And there is something during and after production—and that is more creation, further development.

If that idea could somehow be given central importance for a time, its effect would become evident. Not only would it change men's savage misconceptions of the function and process of life, but it would spread into all the regions of human activity and correct the evils which come of the pulling and hauling which exist between those who know that life means motion and those who think that it does not.

It would be only too easy to illustrate this principle by the business world. The soap that was satisfied with just becoming soap and fulfilling the most primitive services that soap could render is not on the market today. Neither is the automobile that was content just to be what it started out, without constant attention, growth, development, improvement and increase of service. If you are in business, your chief business is improvement; production will always be taken care of with reference to anything that is worth producing.

Isn't that the trouble with Government and Finance? Does not the situation today in politics and finance remind us of those industries which have failed to grow with the needs of the times? What is Government but the service of organizing the communal life to minimize the difficulties of living? What is Finance but the service of trade? True, Government sometimes falls into the error that the community exists for the glory of the Government, and Finance falls into the error that commerce exists for the profit of Finance—isn't the end of both precisely like that of the industry which makes the fatal error of thinking that the public is solely dependent on it and must take whatever it hands out?

The trouble with the men in Finance and Government is that they have gone in for reproduction instead of development. They are static instead of progressive. They are in competition with Life, and don't know it, and life moves on. Men go into Government with a smile, as if some mantle of honor had descended on their shoulders. They think of Government as fixed forever, and all they must do is to fit into some eternal niche. Government is a job. And it is becoming a much harder job all the time—not because it is so hard to govern, but because the incumbents of the main jobs of Government have let the shop get into a bad mess. The industry of Governing, so to speak, has been let to run down at the heel.

Finance is in the same way. Financiers have not been busy upon Finance at all, to improve it, to make it more serviceable, less costly to the people. That is why their industry is in danger today. It is being distanced, like a motor model on which no work has been done for ten years. Financiers have been busy devising schemes to make the people come more and more to them, and leave more and more of their earnings each time—and that kind of thing kills any industry. It is killing Finance. The men who have been intrusted with that important service have failed in their trust. Most bankers will agree with this. The competition of Life and Commerce has distanced Finance, and it is questionable if recovery is possible on any line that would now be satisfactory to a single old-line financier.

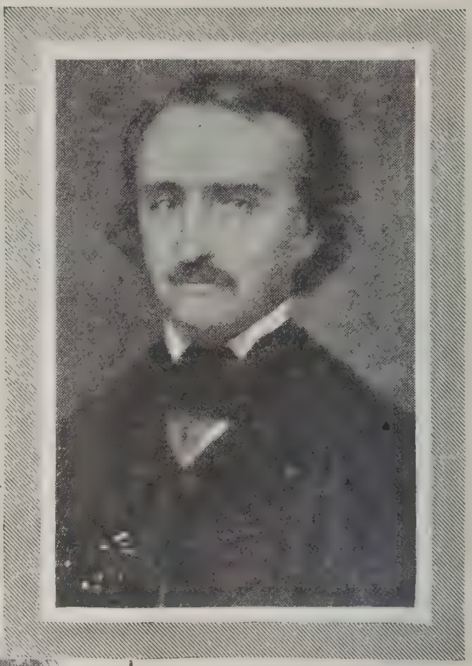
Remember how the saloon tried to reform and make promises and regain good will—when it was too late? There comes a time like that for every industry that has betrayed its public.

Whatever your job is, whatever your business, keep developing, improving it. By so doing you do solid strokes on the real job of life, which is to develop yourself.

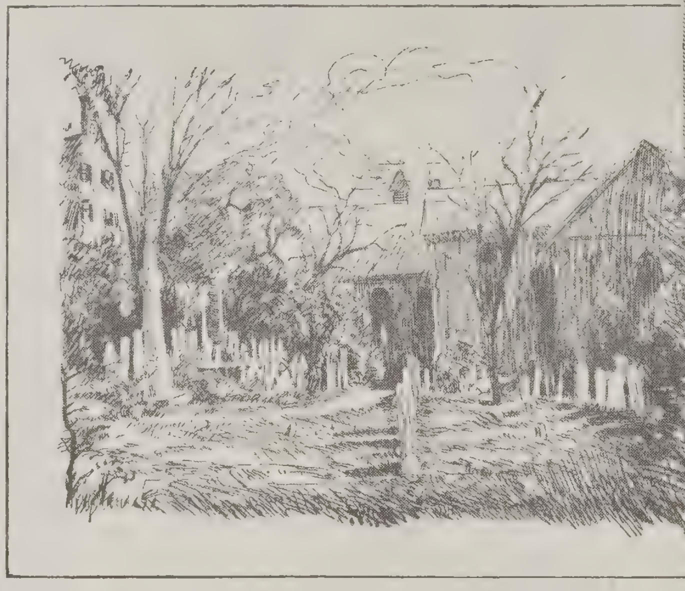
A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Forgotten Trysting Place of Edgar Allan Poe

The Story of a Woman's Devotion and Her Renunciation of a Great Love Recalled



EDGAR ALLAN POE



St. John's churchyard, the poet's trysting place.

By HAROLD D. CAREW

EDGAR ALLAN POE'S election to the Hall of Fame at New York University and the unveiling there of a bust of the poet recalls a chapter of more than passing interest in his life story. It is one of the big love stories of the world, the story of a woman's devotion to the memory of her lover; the story of a woman, who, standing alone in the early years following the poet's untimely death, battled her way in defense of his genius and honor.

The woman was Sarah Helen Whitman, of Providence, Rhode Island, whose little book, "Edgar Poe and His Critics," published more than 60 years ago, attempted to substitute for the travesty the real Poe, world-author, poet and critic. Numerous biographies of the man have been written since Mrs. Whitman sent her book forth 11 years after Poe's death. In all but two the misrepresentations first given permanency of the printed page by Rufus Griswold, a hack writer and one of Poe's contemporaries, have been kept alive without any apparent effort to determine the truth or falsity of the statements which have rendered strange and bewildering the personality of the man. To Mrs. Whitman, more than to any other person, we are indebted for what the world now knows of Poe's private life during the years which have been clouded by the poet's jealous literary rivals.

Sarah Helen Whitman was born in Providence, January 19, 1803. Her father, Nicholas Power, was a sea captain and commanded a vessel during the War of 1812. He was captured and held prisoner by the British until after peace was declared in 1815. He dropped out of sight after his release and his family heard nothing from him for 19 years. His mysterious silence had led his wife to believe he was dead. Then unannounced one day his ship sailed into Providence River. The two little girls whom he had kissed goodby years before were now grown women, and Sarah Helen, the elder, had married a young Boston lawyer, John Whitman, four years before her father's return home. In 1833 Whitman died and the young widow returned to her mother's house and to a secluded life which the curious customs of the times decreed for all widows.

A writer of more than ordinary ability, Mrs. Whitman became a contributor to the Providence *Journal* and to the few struggling monthly and quarterly magazines of the day. It was as a writer of delicate verse that she first came to Poe's notice in 1842. Six years later they met, when Poe's wife, Virginia, had been dead only a year. The story of their meeting and of their engagement is one of the most romantic love stories of history. It is this story which we remember.

Vigorous Style Appeals

POE'S career as an editor began on the *Southern Literary Messenger,* a monthly publication issued at Richmond. When *Graham's Magazine* was established in 1841 at Philadelphia he accepted a position as assistant editor at $10 a week. He remained there only a little more than a year, but it was during this period that his reviews brought him into national prominence. A series of articles on the writers of the day, which he styled "The Literati," at once made him a commanding figure in the world of American letters. His vigorous, analytic style of reviewing made him the most talked-of editor of the day. In his critical judgments he spared no one. In a slashing review of Longfellow's "Outer Mer and Other Poems" he charged the Harvard professor with plagiarism, citing a Spanish poem, which he said was similar, to sustain his charge. All New England rose up in mighty host to Longfellow's defense. The *North American Review,* then recently established, took up the fight and Poe became the stormy petral round which the onslaught raged. He had become as cordially hated as he was feared by those who felt the lash of his withering criticism.

On January 29, 1845, Poe's poem, "The Raven," appeared in the New York *Evening Mirror.* It created a sensation and was widely copied in the newspapers throughout the country. A copy fell into the hands of Sarah Helen Whitman, of Providence, on whose romantic imagination it left a profound impression. Mrs. Whitman, then a widow of 42, had heard much of Poe, and her own verses had received his commendation, but so far as she then knew he had never seen her.

Through a mutual friend, Miss Anna Lynch, a New York woman whose literary gatherings were famous in their day, Mrs. Whitman sent a poem in reply to "The Raven" as a contribution to be read at a Valentine Day party which she gave in 1848. Among those who attended were Horace Greeley, Nathaniel P. Willis, George P. Morris, author of "Woodman, Spare That Tree," Margaret Fuller, Grace Greenwood, Charles A. Dana, editor of the New York *Sun,* and others now all but forgotten. For some unexplained reason Poe had not been invited, although his presence had been eagerly sought on other occasions. The unsigned manuscript verses, however, were later sent to Poe by Miss Lynch, and he at once recognized the handwriting, having a year or two before been shown some of her manuscript. The poem greatly pleased him and in the following June he wrote to another friend, Miss Anna Blackwell, concerning a volume of poems which she was about to publish, offering his assistance, "critical or otherwise."

"Do you know Mrs. Whitman?" he wrote. "I feel deep interest in her poetry and character. I have never seen her but once. Anna Lynch, however, told me many things, about the romance of her character which singularly interested me and excited my curiosity. Her poetry is, beyond question, poetry—instinct with genius. Can you tell me something about her—anything—everything you know—and keep my secret—that is to say, let no one know that I have asked you to do so? May I trust you? I can—and will."

Soon after receiving this letter Miss Blackwell visited Mrs. Whitman at her mother's home in Providence. There she met Miss Maria McIntosh whose literary work had also received much favorable notice. One evening Miss McIntosh remarked: "I met Mr. Poe for the first time a month ago at the home of a gentleman in Fordham, and his whole talk was of you."

The Moon's Silhouette

MISS BLACKWELL, with woman's love of the romantic, could not resist the impulse to confide a secret which was even more tangible proof of Poe's admiration for Mrs. Whitman, and unmindful of the poet's plea for secrecy produced the letter forthwith for Mrs. Whitman's perusal.

Poe's first glimpse of Mrs. Whitman, his "Helen of a thousand dreams," was in the summer of 1845. He had gone to Providence to lecture before the lyceum. After the lecture he returned to his hotel, but the night being sultry, he could not sleep. Near midnight he sauntered out and walked the streets near College Hill and along Benefit street past Mrs. Whitman's home. He saw her among the flowers in a bowered garden in the rear of the house, her graceful figure silhouetted against a full moon. Poe has immortalized this garden in one of his loveliest poetic tributes, "To Helen":

I saw thee once—once only—years ago.
I must not say how many, but not many.
It was a July midnight; and from out
A full-orbed moon, that, like thine own soul soaring
Sought a precipitate pathway up through heaven,
There fell a silvery silken veil of light
With quietude and sultriness and slumber,
Upon the upturned faces of a thousand
Roses that grew in an enchanted garden.
* * * * *
Fell on the upturned faces of these roses
That smiled and died in this parterre, enchanted
By thee and by the poetry of thy presence.

Helen's response did not reach Poe until three years later, when she was 45 and he 39. From time to time during the years since first he saw her, Poe had sent Mrs. Whitman clippings in which he thought she would be interested. Although she knew who sent them, she had never acknowledged their receipt and Poe had despaired of ever meeting her. Early in the summer of 1848 Poe had gone to Richmond to enlist the financial aid of friends in establishing a monthly literary journal which had been his dream of years. While there he received two verses in answer to his poem "To Helen." He was so overjoyed that he abandoned his plans and returned almost immediately to New York, where he obtained a letter of introduction from Miss McIntosh. Armed with this letter he determined to go to Providence; but, not sure that Mrs. Whitman was then at her mother's house, he first sent a letter which purported to be from an autograph hunter requesting a specimen of the lady's handwriting for his collection, cleverly disguising his own penmanship and signing himself Edward S. T. Grey.

Courtship Begins at Once

THE letter drew forth a prompt reply, and two or three days later Poe arrived in Providence and called at Mrs. Whitman's home at No. 76 Benefit street. He presented Miss McIntosh's letter, which read:

> This letter will be handed to you by Mr. Edgar A. Poe. He is already so well known to you that anything more than the announcement of his name would be an impertinence from me. I feel much obliged to Mr. Poe for permitting me thus to associate myself with an incident so agreeable to both of you, as I feel persuaded your first meeting will prove. . . .
>
> Yours very truly,
> M. J. McIntosh.

It is not known how many visits Poe made to Providence during the year that followed his first appearance, but certain it is that his courtship of this lovely and charming woman began almost with their first meeting. The story of their brief engagement after Poe had laid siege to her heart has been told by Poe's biographers, but so little of the real story has been told that the visitor to Providence today will meet few persons who know anything of the scenes which figured in the last romantic episode of the poet's romantic career. The world will never know the heartbreak of their final parting shortly before Poe's tragic death, but there are those who will be glad to know that the enchanted garden which he immortalized, the garden of his Helen of a thousand dreams, still blooms with lovely roses.

So little of that section of the Providence which greeted Poe in 1848 has been changed by the expansion of a great industrial city that the house and garden are practically the same as they were 75 years ago. The garden adjoins the ancient St. John's Episcopal churchyard and burial ground and is wholly obscured from the view of passers-by who climb Church street, a narrow thoroughfare leading from the canals and the noisy city.

Had Great Sympathy

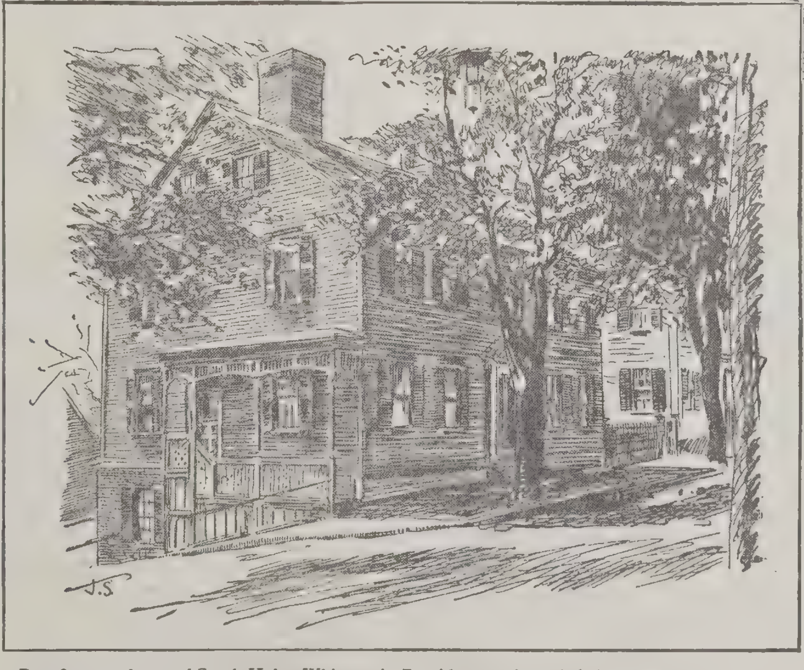
POE'S coronation in the Hall of Fame recalls so much in the sad and eventful years of his life, and the story of Sarah Helen Whitman's love for Poe and her sympathy for this ill-starred son of genius refuses to be forgotten. Of all the poetic women who showered their affections upon this fascinating, bewildering man, none understood him better than did Helen Whitman. It was not the wayward man of weakness given at times to excessive drinking whom she saw, but a master-poet, a man of intellect and imagination, a man whose power of expression in creative beauty has given him a place in world literature. She understood the real passions of his temperament and perceived his ideals where others saw only the moral faults of an erring man. In this year of his triumph it is worth noting that of all the men and women whose names are now linked with his through love and friendship and even hate, most, if not all, would have crept silently into obscurity with their generation. Their sole titles to remembrance, however, now rest securely in the immortality of his fame.

Poe's meeting with Mrs. Whitman opened a brief period for new hopes. His young wife Virginia had been dead little more than a year and he had been greatly depressed by the poverty that marked her last days in the little cottage at Fordham, a few miles from New York. He had been ill much of the time—an illness which his enemies declared was due mainly to the folly of excessive drinking and carousing. Unfortunately, there appears to be no record of the length of time Poe remained in Providence on his first visit, but it is recorded that he met Mrs. Whitman's younger sister and her mother, Mrs. Power, an irascible old lady who seems to have sensed at once the purpose of Poe's visit. He was cordially welcomed by the household at first, but wagging tongues soon began to busy themselves and disparaging stories of Poe's private life, set afloat by rentless foes and jealous rivals, soon reached Mrs. Power's ears.

Poe's first love letter to Mrs. Whitman was dated October 1, 1848, scarcely more than two weeks after their first meeting. It was in reply to one written by Helen after his departure from Providence and reveals that her impetuous suitor had promptly asked her to be his wife.

"All thoughts," he wrote after his return to New York, "all passions, seem now merged in the one consuming desire—the mere wish to make you comprehend—to make you see that for which there is no human voice—the unutterable fervor of my love for you—for so well do I know your poet-nature, oh, Helen, Helen! that I feel sure if you could but look down into the depths of my soul with your pure spiritual eyes you could not refuse to speak to me that, alas! you still resolutely leave unspoken—you would love me if only for the greatness of my love. Is it not something in this cold dreary world to be loved? . . . . During our walk in the cemetery I said to you while the bitter, bitter tears sprang to my eyes—'Helen, I love you now for the first time.'"

The old burial ground of St. John's church, where Poe and Helen walked and where he first told her of his love, is now hidden from view on all sides. The only entrance is through the yard of the diocesan house of the Bishop of Rhode Island, but it may be seen from the rear of the ancient houses along Benefit street from the old Whitman house to the rectory. Rambler roses are everywhere in abundance, and the board fences which separate the estates from the cemetery are banked high with flowers. It is as though every leaf and bud felt the spiritual presence of a great love, as though they had been created to lend enchantment and poetic beauty to a poet's forgotten trysting place.



Benefit street home of Sarah Helen Whitman in Providence, where their last meeting took place.

The chronicle of Poe's last courtship gives us nothing but an ordinary story of unrequited love, a story of a mother who strenuously opposed her daughter's marrying and of a daughter who was torn between the conflicting forces of duty and obedience and hope and disappointment. Poe came often to Providence. His many lecture engagements throughout New England—in Boston, Hartford, Lowell and other cities— gave him opportunity to stop off at Providence on his way to or from New York, much to the annoyance of Mrs. Power. Poe's second letter to Helen was dated October 18. Before she could reply to it Poe appeared in Providence and remained several days, stopping at the old City Hotel. The morning of his arrival he sent Helen a note, and she replied by messenger that she would meet him at noon at the Athenaeum, a favorite resort of hers. His next visit was November 7. Although he was ill and confined for a day or two at the hotel, they met again at the Athenaeum and spent considerable time there reading the current magazines and browsing among the books. "An hour or two after he left the city," Mrs. Whitman records of this visit, "certain reports were communicated to my family . . . . which augmented almost to a frenzy my mother's opposition to the relation then subsisting between us." The "certain reports" were to the effect that Poe had been seen at his hotel bar under the influence of liquor, and the talebearer made good use of his opportunity to tell Mrs. Power all about it. Poe had promised Helen that he would quit the use of liquor, and there is no reason to doubt that he kept his promise. The "certain reports" to the contrary are believed now to have been the work of a jealous rival who hoped to win Mrs. Whitman's hand in marriage.

Romance Had Opposition

POE'S courtship progressed rapidly, despite the opposition of Mrs. Whitman's mother and sister. Poe wrote a letter to the rector of St. John's requesting that he "publish the bans of matrimony between Mrs. Sarah Helen Whitman and myself on Sunday and on Monday." And the note added: "When we have decided on the day of the marriage we will inform you, and will thank you to perform the ceremony." The note was intrusted to William J. Pabodie, a friend of the Whitman family, but was evidently never delivered to Dr. Crocker. It was found among Mrs. Whitman's papers after her death in 1878.

Poe's last love letter to Helen of which there is any record, dated December 17, 1848, was written at Fordham. Five days later he was again in Providence. It was at this time that he wrote to Virginia's mother, Mrs. Clemm, who had continued to keep their humble home together after her daughter's death: "We shall be married on Monday, and will be at Fordham on Tuesday, in the first train." Poe had come to Providence to lecture on "American Poetry" before the lyceum, where 2,000 persons were present to hear him. A night or two after the lecture he appeared at Mrs. Whitman's house in a state of partial intoxication, according to Pabodie, and it was on the following morning that Poe gave Pabodie the note to Dr. Crocker. How much Pabodie, who was himself enamoured of Mrs. Whitman, may have had to do with bringing about the stormy scene between Poe and Mrs. Power when the poet next visited the house may only be conjectured. There is a feeling among those who have studied the story of their last meeting that Pabodie, although pretending to be Poe's friend, was in fact the one who prodded Mrs. Power into believing that her daughter would be making a mistake if she married Poe. Pabodie was present at the final meeting between Poe and Mrs. Whitman, at which Mrs. Power was also present. Mrs. Whitman, worn by the worry and argument and opposition, was ill, and her mother seized the opportunity to upbraid Poe and to remind him that the train for New York left within an hour.

Falling upon his knees beside the couch upon which Helen lay, Poe begged her to reconsider and to speak to him.

"What can I say?" she asked.

"Say that you love me, Helen."

"I love you," she said—the last words she ever spoke to him. Within an hour he was on the Stonington express train bound for New York.

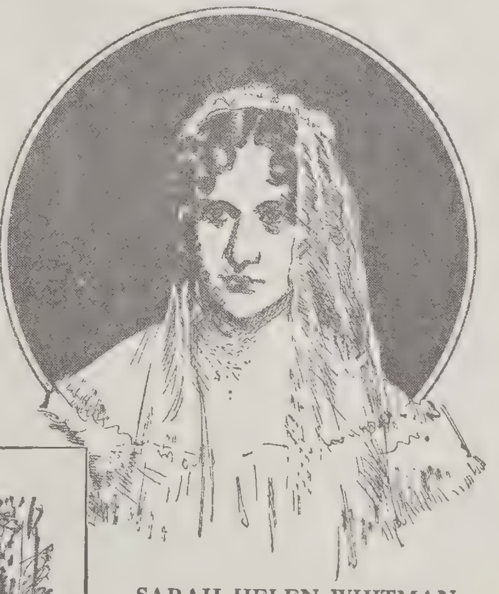
His Note Unanswered

A BRIEF note from Poe in January, unanswered by Helen, bares his heart: "Heaven shield you from all ill! Let my letters and acts speak for themselves. It has been my intention to say simply that our marriage was postponed simply on account of your ill health. Have you really said or done anything which can preclude our placing the rupture on such footing? If not, I shall persist in the statement and thus the unhappy matter will die quietly away."

Helen's remaining years were spent in Providence except for brief visits with friends and a trip to Europe. After the death of her mother she lived with her sister, who died in 1877. Less than a year later, June 27, 1878, her own life flickered out. She was buried in the North Burial Ground. Although she had requested that no stone should be placed on her grave, a simple headstone with her name on it marks her last resting place.

During her last years she devoted herself unremittingly to the task of aiding Poe's English biographer, John H. Ingram, and his French translator, Stephane Mallarme. But her own poetic portrait of Poe best serves to give us the measure of her devotion to the memory of her wayward idol:

After long years I raised the folds concealing
That face, magnetic as the morning's beam:



SARAH HELEN WHITMAN

While slumbering memory thrilled at its revealing,
Like Memnon waking from his marble dream.

* * * *

Oft has that pale, poetic presence haunted
My lonely musings at the twilight hour,
Transforming the dull earth-life it enchanted,
With marvel and with mystery and with power.
Oft have I heard the sullen sea-wind moaning
Its dirge-like requiems on the lonely shore,
Or listening to the autumn woods intoning
The wild, sweet legend of the lost Lenore.

* * * *

Sweet, mournful eyes, long closed upon earth's sorrow,
Sleep restfully after life's fevered dream!
Sleep, wayward heart! till on some cool bright morrow,
Thy soul, refreshed, shall bathe in morning's beam.

Though cloud and sorrow rest upon thy story,
And rude hands lift the drapery of thy pall,
Time, as a birthright, shall restore the glory,
And Heaven rekindle all the stars that fall.

"Pitiless Publicity" That Has Become Pitiful

Why There Are Few Public Men But Thousands of Public Figures; "Printed Matter" of Chain-publishing Commands Little Influence

By "OBSERVER"

PITILESS publicity that cannot be pitiless, within bounds of honesty, decency, justice and fair play, must perforce become pitiful. The press wants to see individuals at their best and picture them accordingly, because it is pleasanter all around, but shall it be denied the right to exhibit graphic portraits of those whose weakness is to be depicted solely when they have assumed their best company manners? On what plea can individuals who have become public characters refuse glimpses of themselves when, mentally and officially, they have dropped their kid gloves, frock coats, silk hats and shiny patent leathers; when their natural element, and preference too, is for overalls or an old suit, unbuttoned collar, ruffled hair, peekaboo socks? Must their service as statesmen be always one of unbroken gourmetism or shall it be, on occasion, ham and cabbage?

What you, reader, are concerned about with regard to the *Fourth Estate* is why it should have become the mirror wherein individuals who claim to worship the icon of pitiless publicity like to gaze at themselves only while donning their mantle of perfection or infallibility or paternalism. If the mirror sees through the masquerade then they proceed to crack it.

Yet it is doubted that readers care to be regaled, day in and month out, with the monotonous gallery of figurines with their studied intents and mannerisms. Is it due to this that today there are few public *men* but thousands of public *figures?*

There Are 20,000 Publications

NO ONE expects the press to be perfect. It could not be if it tried. But its present multiplicity of tendencies is such that "press" is a misnomer if its applicability presupposed the once single intent of reflecting or guiding public opinion. Its chief purpose—barring the few exceptions that will be noted—is to turn out columns of words whose sins of omission and commission, under the circumstances of journalism's traditions, are enough to cause the famous American editors of the last century to be glad that they are dead.

It is not possible to give figures with absolute accuracy but it seems to be taken for granted that there are in the United States 40,000,000 readers. To serve these there are about 20,000 periodicals, published in about 10,000 places. Of these, the truly serious and legitimate journalistic organs are probably 10,000. Of the readers, about 20 000,000 are of average intelligence and common sense, even if not literate, and the majority may be said to represent organic American public opinion.

On this basis, however approximative, there would be an average of 2,000 serious readers for every journalistic periodical. This ratio, of course, is susceptible of countless variations. It may seem an infinitesimal total, especially now when it is the trade fashion to measure the importance of a publication by its circulation, but the fact is that circulation is not a true index of anything except commercial value.

The magazine and newspaper profession of yore has become a business. There are a few instances of such periodicals wending the even tenor of their way to the fullest extent of their ability, but as things stand today there are too many publishers who "publish" as against editors who edit.

As to Chain-publishing

CHAIN-PUBLISHING is the latest evolution. There is today in this country one publisher who lays claim to a circulation of 20,000 000 for all of his properties which he calls newspapers and magazines, but the fact is that these, separately or together, are the least influential in the nation, and except for them their owner's name would hardly be known beyond the block where he lives. These periodicals purvey printed matter, often made attractive to the eye by the infusion of much pictorial matter, but "printed matter" is the best that can be said of them.

Despite the advent of "boiler plate," which is not essential to the newspapers that make use of it, the country or small-town newspaper still represents good American journalism. The country editor has been ridiculed or pitied by his alleged metropolitan colleague, but the difference between the two is easily traced; the latter has money and the former has influence. The country editor is willing to take potatoes or shoes in exchange for subscriptions, thus necessitating some quick-witted problems in economics—barter in its sublime simplicity—but he has the satisfaction of selling editorial service, as against the mass of his metropolitan competitors who purvey paper and ink jumbled together.

Let's go back to the 2,000 readers and 10,000 periodicals. This, of course, excludes the vast army of comic-strip readers, the devotees of exotic literature, the followers of trade "literature," the disciples of class writings, and, conversely, of the periodicals catering to said readers.

The questions which arise are:

Do readers, either in average or in entity, count above the periodicals they buy or not?

Have they a voice in them, to the extent of expecting that they shall be all they should be, or must they take each periodical—as too often is the case—*as is?*

Are periodicals intended to portray and interpret thought or are they privileged to manufacture it, usually with outside help?

Shall periodicals make use of writers and contributors to the extent of their independent ability, experience and responsibility, or are they to be "made" by fiat of publishers who have certain axes to grind and many more to conceal?

In short, is the periodical to be the common educative medium within reach of the public or is it to be the private lobby of the publisher, his interests, and his friends?

Every tenth reader recruited no doubt from the 20,000,000 referred to above, peruses the *Literary Digest,* which in a few pages endeavors, every week, to single out the salient editorial opinions on given topics of immediate or current interest. Within its province it is not only a unique periodical, useful as a timesaver, but it is impartial, according to its standards. Yet one may well ask if the "leading" editorial opinion of the United States is that culled from the few prominent newspapers which it delights to feature every seven days? What of that more important editorial opinion that remains submerged because it is not "prominent"?

The *Literary Digest,* to facilitate the purport of some of the quotations, often qualifies the periodical's name with parenthetical abbreviations intended to indicate its political color, notwithstanding that so general a term as Independent, Democratic, Republican, or a combination of the first with either of the others, is apt to be confusing and even misleading. To make the classification complete, for the benefit of the reader untutored in journalistic variations of this kind, it would be necessary to add other abbreviations to indicate private, financial, trade and other fetishes.

The *Christian Science Monitor* is, or was, the one independent newspaper in our land. It is noncommercial, and so far has resisted every influence in that direction, but one hears it seldom quoted. Unfortunately its name operates against it, because it sounds as if it were a religious daily, whereas such is not the case.

The New York *Times* manages to maintain its supremacy, such as it is, over other newspapers in the metropolis, especially now when newspaper-making is a rather precarious proposition. But though the *Times* is a well-edited newspaper, well-written and clean to the eye, it lacks personality and individualism. It enjoys political prestige not because it is a power politically but because it is the only newspaper in the country which prints important reports, debates and proceedings in full, and so can be quoted easily. Its true value, however, rests upon its detailed mercantile and financial sections.

The New York Newspapers

THE New York *Herald* rests, but not in peace, despite Frank A. Munsey's boast that it is the best newspaper possible. That Mr. Munsey has ruthlessly massacred *Herald* and *Sun,* and then bequeathed the name of James Gordon Bennett's pet to the alleged New York *Herald* of today is patent to everybody but him. With the *Press,* that makes three newspapers of much fame which Mr. Munsey has killed off. Of the *Evening Sun* the less said the better.

The New York *Evening Post* likewise has suffered from metempsychosis. It has made a few attempts to commercialize its columns but its ancient prestige is dead and quite forgotten. It serves many masters, probably belongs to as many more, and manages to have its name propagated here and there by means of commercial syndicated correspondence. The *Evening Telegram* is worthless. The Hearst dailies are not newspapers. The *Illustrated News,* having forced a big circulation by lotteries and prizes freely distributed for absurd "contributions" by moron readers, has now filled its pages with advertising and is making hay where the Subway (the only place it is looked at) *Sun* shines. The *World* is not as powerful as it used to be, politically, and now its editorial control is said to have passed into the hands of Bernard M. Baruch. At least, this is said by those best informed on inside *World* organization. The *Globe* has many journalistic merits and could achieve many more if it tried. The *Tribune?*—the tragedy of the *Tribune* is sad, but not any longer important.

Philadelphia's dailies have been relegated to the background since the *Public Ledger* started its career as an international newspaper.

The Baltimore *Sun,* by which readers rise and dine and retire, is a good newspaper, but it no longer is nationally influential as it was, say, in 1900.

Washington! The American city entitled to the best newspaper in the United States has no newspaper worth the name.

The Evening *Star,* said to be the second best "advertising mine" in the country, has usually been a colorless administration paper, with an exception noted under President Roosevelt.

The Washington *Post,* often compared to the New York *Sun* at the latter's best a generation ago, was one of the most quoted newspapers in the United States under Scott C. Bone, who would not yield to the unilateral and necessarily pecuniary interest of John R. McLean, of Cincinnati *Enquirer* fame. The passing of Bone meant the passing of the *Post.* Today it is the newspaper joke of the country. Its patronym of "Court Gazette"—to explain the alleged White House influence—has strayed away the last few serious readers. It is bought because officially, in Washington at least, one's education would not be complete without its daily perusal. Its daily State Department-President-Congress boost, signed and copyrighted to boot, is the most sorrowful bit of reporting ever perpetrated in an important newspaper—and its writer has done better. As the *Herald* never counted, and now has been swallowed up by Mr. Hearst, Washington is without a newspaper and it eagerly awaits the New York newspapers for news about itself.

Having referred to the *Monitor,* Boston may be further identified for the *Transcript.* In the neighborhood there is the Providence *Journal* long looked to for original news with regard to Washington.

As one proceeds westward one finds many good newspapers, *but the continual inroads of syndicate correspondence from New York or Washington and the constant attempt to establish chain newspapers* are bound to affect even the most rigorously edited newspaper.

War correspondence was the first step for knocking much news out of newspapers. It was Woodrow Wilson who, as president of Princeton, said in 1909 that "all newspapers are alike, all provincial, not excepting the great metropolitan dailies," for which George Harvey, then editor of *Harper's Weekly,* chided him. If by provincial Dr. Wilson meant that they cared nothing beyond the most promising circulation routes, and therefore newspapers catered only to local affairs, he was right, because in general the amount of crass ignorance, in editorial offices, at the time that the war broke out has been surpassed only by the preposterous excesses in alleged international news catering of the present day.

The *Review of Reviews* recently urged editors to stop playing up so much foreign flabberdash which reporters have been avidly seeking of every Tom and Dick and Clara returning from that indeterminate place called "abroad."

Sharing "Staff" Correspondence

NOT all newspapers, of course, could indulge the luxury of sending their own correspondents abroad, to say nothing of their inability to maintain even a "Washington correspondent," but it was not until even the richest newspapers began to feel the pinch of its maintenance costs that they began to share, for a consideration, this staff correspondence with less opulent dailies. Yet only a fraction of this correspondence justifies its expensive and expansive continuation. The average staff correspondent's contribution is, in relation to the news sent by the press associations, mere redundancy. This bureau craze as practiced now is not journalism—it is for the sake of a "front."

In general our American newspapers have become too standardized in their editorial atmosphere, even though each follows one of half a dozen accepted systems of mechanical pattern. Too many publishers who like the word "editor" are in reality nothing but printers.

The last year has brought another plague. Vapid competition is causing newspapers to fill pages upon pages of self-glorifying exuberances signed by more or less deposed statesmen. At the very moment of writing the New York *Times* and Chicago *Tribune* reluctantly, but none the less with some irritation, announce that the "Lloyd George memoirs" contract has been rescinded because the Welshman has seen fit to turn an honest penny by becoming a press association contributor. That probably these writings are literary skyrockets goes without saying. The kaiser's writings fizzled. How much better if these American newspapers paid their 40,000 pounds to honest-to-goodness American reporters!

The fact is that some of these newspapers have usurped functions of the book and magazine world—and apart from this further displacing the reporter from his proper sphere, the newspaper, in attempting to become book and magazine, too, has failed to be any one of the three.

Common Sense All Needed

AT THIS period of our national life, newspaper publishers face a greater duty than ever to resume some originality and common sense in making their newspapers. The press association is a natural evolution, mainly economic, of newspaper work, but the syndicate craze cannot be condemned too severely. The newspapers using it confess the use of secondhand material. They confess inability to have an adequate staff, no matter how modest. Because the syndicate correspondent serves countless and ever-changing masters his work is anemic. The idea of "simultaneous publication" is worthless. Altogether it is a practice the like of which is not tolerated in any other business or trade.

What is needed today is a halt to this highbrow hodgepodge palmed off by newspapers in need of money or special writers who serve more or less unknown masters, and to substitute it with serious, well-poised articles of the type that gravitates to more exclusive periodicals, where they are out of reach of the masses, and of such periodicals there are too few to meet requirements.

Articles in magazines are of limited influence because magazine readers are not the class that is in need of immediate editorial service, but the men and women who feel more at home with their favorite newspaper than with any other organ. Is the mentality of this class going to be permitted to grow stale?

Moreover, in many magazines, no matter how famous

(Concluded on page 14)

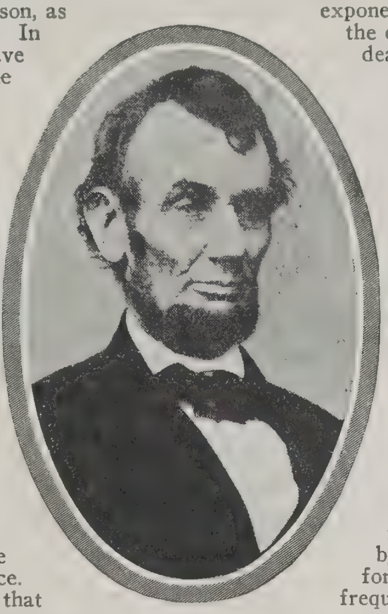
The Books That Abraham Lincoln Read as a Boy

His Mother Taught Him to Read and His Step-mother Urged Him to Study

By THOMAS J. MALONE

"HIS own mother taught him to read," says a biographer, "and his stepmother urged him to study." No wonder that Abraham Lincoln in his adult years spoke with equal warmth of affection of the mother who died when he was nine years old and of the other mother, hardly less dear, who succeeded her in the Thomas Lincoln household not two years later. Lovers of Abraham Lincoln everywhere should think gratefully of Mrs. Sally (Bush) Johnston who became the second Mrs. Lincoln and who was kind to Nancy Hanks' son, as the son himself has testified. In what way could kindness have been better demonstrated—she urged him to study! Was greater service ever done for America?

What he read and what he studied, we have from Lincoln himself, the meager list of books within his reach in the Indiana frontier—the Bible, "Aesop's Fables," "Robinson Crusoe," "The Pilgrim's Progress," Shakespeare, Burns, Weems' "Life of Washington" and "a History of the United States." These were the books that were to mold the chief figure of the nineteenth century. These he read and reread, his biographers tell us, poring over them daily and nightly, drinking them in until he had memorized them, page after page. Books were treasured in those days because they were so scarce.



ABRAHAM LINCOLN

Glorious words and deeds that fire the minds and hearts of men attest what he learned from the Bible and Shakespeare, but what was there in, say, a book of fables and a school textbook to shape him who was to be the great commoner of his age?

Old Aesop knew what he was about. Reputed dwarf and former slave, of that humble origin that has characterized so many of the world's benefactors, he gathered those marvelous tales of practical morality, universal in appeal and application, summarizing the lessons of man's experience and preserved in the folklore of the Greeks and peoples before them—tales in which beasts and birds talk and do wise or foolish things, closing with generalizations as to man's conduct.

"Self help is the best help," "Birds of a feather flock together," "Like will draw like," "In union there is strength"—such maxims belong to all races. Who may know what bearing the Aesopian fable of the father with the bundle of fagots, teaching his sons the lesson of strength in union, may have had on the unswerving conviction of Lincoln, the President, that America must not be dissevered? The use of story to impress vital truths has been common to great teachers in all times—it was the practice of Jesus in the parables, of Lincoln in his anecdotes.

The narrative of Robinson Crusoe is part of the heritage of every boy; but what a book for a boy growing up in a sparsely settled and primitive neighborhood where the same initiative, resourcefulness, self-reliance, frugality and perseverance enforced upon Crusoe were practiced as of everyday necessity! The Pilgrim's Progress must have been to the boy Lincoln a tale of valiant venture, as to many another youngster devouring it with avid eyes while the evening's wood waited to be brought in; but we have no reason to believe that into his mind did not seep something of the grandeur of that allegory of the common man's age-long struggle against evil and of victory achieved through recognition of, reliance on, the Divine. How much of the man Lincoln's deep religious nature may not have been traceable to this book by a Bedford tinker, who was the son of a tinker?

Modern historians view with amusement Mason Weems' rhapsodic eulogy of George Washington, for the author of the "cherry tree" story is said to have been careless as to facts, but maybe young Lincoln found in it some grain of profit, notwithstanding. Weems begins his book thus:

"His education was of the private and proper sort. Dead languages, pride and pedantry had no charm for him who always preferred sense to sound, the kernel to the shell. A grammatical knowledge of his mother tongue—the mathematics—geography—history—natural and moral philosophy, were the valuable objects of his youthful studies: And in these he made the proficiency of one who always loved to go deep. At school he was remarkable for good nature and candor, qualities which gave him so entirely the hearts of his young companions that a reference to him was the usual mode of deciding all differences."

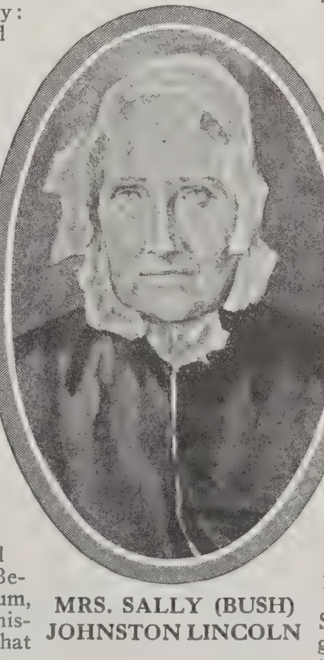
According to his biographers, Lincoln, as a young man, though of unusual strength and adept in all athletic pastimes of his day, was in such demand as a referee between contestants that he served as such more often than he took part in contests. He was regarded not only as an exponent, but as the embodiment, of the doctrine of fair play—the square deal.

Weems, in his dedication of the book, stated that it would give him much joy "should it contribute in any wise to diffuse the spirit of Washington—in any degree to promote those virtues which rendered him the greatest, because the most serviceable of mankind."

"The spirit of Washington. . . the most serviceable of mankind"—Ah, Parson Weems, you did a bang-up job! Here is one hat that is off to you in this twentieth century.

The boy Lincoln read his Bible. If we did not know that to be true, that the example was set him by his mother, it would be suggested by the beauty, the majesty, of his formal diction as a man, by his frequent quoting from Scriptural passages and his constant public recognition of a Divine Providence to whom man looked for guidance and succor.

"Both read the same Bible and pray to the same God," reads the second inaugural in classic measure, poignant in its solemn melancholy, "and each invokes his aid against the other." And again: "Fondly do we hope, fervently do we pray, that this mighty scourge of war shall speedily pass away. Yet if God wills that it continue until all the wealth piled up by the bondman's 250 years of unrequited toil shall be sunk, and until every drop of blood drawn with the lash shall be paid by another drawn with the sword, as was said 3,000 years ago, so still must it be said, that the judgments of the Lord are true and righteous altogether." His exhortation, in closing, for a continuation of the war to victory, is further testimony: "With firmness in the right as God gives us to see the right." In the Gettysburg Address, he calls for a resolution "That this nation, under God, shall have a new birth of freedom."



MRS. SALLY (BUSH) JOHNSTON LINCOLN

One may ask what Shakespeare—that son of a glover, holder of horses at theater doors—meant to the boy Lincoln, a barefooted rustic in Spencer County, Indiana, one of a large family living in a one-room log cabin, reading by the light of pine knots in a crude open fireplace—to that boy who had never seen the inside of a theater, to whom stage and scenery and costuming were unknown.

Imagination thrives on what one does without. The chores done and the book opened, in an instant the bare cabin vanished and he was in the streets of Rome. Before the boy stood, in the rostrum, the noble Brutus, making fair admission, and bold, to the populace that he had killed his friend to preserve the state—"not that I loved Caesar less, but that I loved Rome more." And years later, a circuit-riding lawyer from Sangamon County, Illinois, come up to the presidential chair from a youth spent in slaughtering hogs and splitting rails, rallies the forces of the Union to a war against secession, not that he loved his brother of the South less than his brother of the North, but that he loved America more.

In a court room in old Venice he heard from the lips of a learned judge that the quality of mercy is not strained, that it droppeth as the gentle rain from heaven upon the place beneath; that it is twice blest; that it blesses him that gives, and him that takes; that it is mightiest in the mightiest; that it becomes the throned monarch better than his crown; that his scepter shows the force of temporal power, the attribute to awe and majesty, wherein doth sit the dread and fear of kings, but that mercy is above this sceptered sway, is enthroned in the hearts of kings, is an attribute to God himself; that earthly power doth then seem likest God's when mercy seasons justice.

Did ever ruler more wisely temper justice with mercy than this man, who, as president, was the despair of military authorities in matters of drastic discipline, this friend of the boys who slept at their posts, this sympathizer with the mothers of America!

He read Burns as the poet of the plain people, the singer of humble joys, and knew him for one of his own kind. He understood him; their hearts beat together.

There is no record of the authorship of that other book which enthralled the youthful Lincoln, mentioned by biographers simply as "a History of the United States." A grateful people can honor its author's memory though it knows not his name. To many a reader it may have meant just so many hours of drudgery, of skimming a statement of dry and unrelated facts, as so often in this day of lavish opportunity in the schools the textbook history means; but to young Abraham Lincoln, bookworm, whose attendance at school in all his life fell short of a full year, it was a rich treasure house that opened to him his country's story.

From its thumb-soiled pages he gathered some idea of the wonder and the mission of America. Lying on the floor, face to the open fire, the boy sailed with Drake and marched with Cortez, fought with Miles Standish, toiled manfully with the Boston tea sinkers, stood by the side of Richard Henry Lee in that hall in Philadelphia when he rose to herald a new nation and looked on in awe and admiration and a strange pride when a beaten enemy gave up its sword at Yorktown and slunk off for home.

He saw Columbus, a poor sailor, son of an obscure Genoese wool comber, set out for unknown seas on the grandest adventure man has undertaken in historic times. He saw his tiny ships tossed by storms. He saw fear, distrust and mutiny rise, threatening the mission, even the life, of the commander. He saw that brave mariner, with a faith and a courage that have been spur in all centuries since to men of high purpose facing tremendous odds, sternly holding his course and to all protest giving the one command—to sail on, and on, and on.

So swiftly does the spirit of freedom grow—12 years after the settlement of Jamestown, Virginia, holds the first representative assembly in the New World. The colonies become the refuge of the oppressed of Europe. The struggle for religious tolerance slowly wins to victory. As early as 1754 a Franklin proposes a permanent union of the colonies. An Otis cries out that taxation without representation is tyranny, and a Patrick Henry warns a headstrong king of the fate of tyrants. Paul Revere's galloping steed carries the future of republics. To a skeptic world goes the declaration that the United Colonies are free and independent states, and deathless names pledge, in its support, their lives and fortunes and sacred honor. A Washington makes that declaration good by blood and sacrifice, and "We, the people of the United States. . . do ordain and establish" startles the Old World monarchies with prophetic challenge.

Through "a History of the United States" ran the story of territorial growth. Virginia ceded her claims to the Northwest Territory to the Federal Government, adding a new empire to the public domain dedicated forevermore to the exclusion of slavery. With the purchase of Louisiana, a vast arena is thrown open for the battle for slave and free soil. The young Lincoln read, and thought.

On a hilltop in Larue, formerly Hardin County, Kentucky, stands a granite edifice, stately with pillars. It incloses a little one-roomed cabin. The cabin has a door and one window, half size. It is the birthplace of Abraham Lincoln, restored by a people that loves him, rebuilt from the original logs and placed on the orignial site. Thousands visit it yearly, and no man, no woman, can see that cabin and go away without being a better citizen of the Republic.

What's So and What Isn't About Evolution

Darwinist Theory Fades as Scientific Knowledge Increases

By GEORGE M'CREADY PRICE
Professor of Geology, Pacific Union College, California

IF WE cross a tall and a dwarf pea (*Pisum sativum*) both pure bred, we always get all talls in the first hybrid generation. There are no dwarfs, and no intermediates. In the language of the new science of genetics, the tall character or factor is *dominant,* and the dwarf is *recessive.* However, when these new hybrid talls produce seeds which grow, we always get 25 per cent which are talls and prove to be pure bred, breeding true ever afterward; 25 per cent which are dwarfs and breed true; and 50 per cent which will be talls, but hybrids, breaking up in the next generation just as already stated for the first hybrid generation. And like Tennyson's "Brook," this process will go on forever, and can be tested out by any person in any part of the world.

Similarly, when we cross a black and a white (albino) guinea pig, we always get all blacks in the first hybrid generation; and it makes no difference whether it was the father or the mother that was black. But in the next generation we get 25 per cent pure bred blacks; 25 per cent pure bred whites, just as pure bred in respect to their future progeny as if they had come from a hundred generations of unmixed ancestry; and 50 per cent which will be black in color, but which will prove to be hybrids, breaking up in the next generation in the same mathematical proportions as before.

What Mendelism Reveals

ON THE other hand, if we cross a black and a white Andalusian fowl, we seem to get a different kind of result. For in the first hybrid generation the chicks are a queer mixture of color, called "blue" by poultry fanciers. Here it seems that neither factor has been dominant, but that each has been of about the same potency. But in the next generation we get the same old percentage, 25 per cent pure bred black, 25 per cent pure bred white, and 50 per cent hybrid blue. And thus it goes on ever afterward. In reality this case is not different from the ones mentioned above; the apparent difference has come about because neither the blackness nor the whiteness was dominant, each proved to be equal to the other.

Thousands of colors, shapes, sizes, and what nots in plants and animals have now been worked out according to these laws; with the result that we are now beginning to know something quite definite about combinations of factors or characters in plants and animals, just as we have already learned about a great many combinations which we can make in chemistry. Of course, our knowledge of the possible combinations in plants and animals does not at all approach the completeness which our knowledge has reached in chemistry. Probably it never will be as complete; for it is a much more complicated process, and the difficulties in the way of such biological experiments are a million times greater than in chemistry. But the two classes of combinations seem to resemble each other very closely, and the one class of phenomena is evidently as much a matter of law as is the other.

These results among plants and animals are known as Mendelism; and they were first given to the world about 20 years ago. Since then they have completely changed the attitude and the views of the scientific world regarding heredity, and especially regarding the Darwinian tradition about plants and animals always showing an unlimited tendency to vary in all directions and to an unlimited degree. Mendelism is now showing us exactly *how they vary;* but it also shows us the precise limits of their variations, and the limits of the possibilities in the way of hereditary transmission. And as Edwin Grant Conklin remarks: "At present it is practically certain that there is no other kind of inheritance than Mendelian."

Wholly New Kinds Come

THE Darwinists used to emphasize the fact that no two individuals are exactly alike, that not even two leaves on the same tree are alike. All this is true; but we now know that these differences between individuals of the same species are of two kinds, quite distinct from each other:

1. Individual variations, or *fluctuations,* as the scientists term them, which seem to be caused by environment. But these are *never* hereditary, or never passed along to the next generation.

2. *Modifications,* which are born with the individual, and which are faithfully passed along in heredity either as a dominant or as a recessive character.

The changes which are brought about in the individual during its lifetime, as the effects of its surroundings, such as heat or cold, good food or bad, by exercise or the lack of it, in short, as the effects of use or disuse or the effects of "environment," to use the scientific term—all such changes are mere fluctuations; and are not hereditary, that is, are not passed along to the next generation. To use the scientific phraseology, all such variations are "acquired characters," and *acquired characters are never transmitted in heredity.* It is the same principle as the well-known impossibility of perpetual motion. A wheel by its turning does not work up more and more speed, or more and more energy of rotation, merely by its turning. It takes some external force even to keep it going.

On the other hand, all distinct characters or factors, whether of form, or color or whatever, are *modifications;* and they are faithfully carried along in heredity, according to Mendel's laws.

These results have had to work their way against a tremendous amount of opposition; for they strike directly and heavily against many old ideas which the world had been accepting for over half a century. But most scientists are now willing to acknowledge that there is no other method of inheritance, except the Mendelian.

But the reader must not get the impression that there is no room for anything really new under such a system as this. It is true, that when we are dealing with only *one pair* of contrasted characters at a time, as in all the examples mentioned above, there is not much room for strictly new types, except as in the case of a blending of the two contrasted characters, like the blue Andalusian fowls. But when we combine *two pairs* of contrasted characters, there is room for two new types to appear; and when *more than* two pairs of contrasted factors are blended, there is room for many more new types, the number of new types being capable in each instance of arithmetical prediction.

For example, if we cross a round yellow pea with a wrinkled green pea, in the first hybrid generation we get all round yellows; because round form and yellow color are both dominant characters. But in the next generation, out of every 16, we get nine round yellows, like the one grandparent, which come true to seed; one wrinkled green, like the other grandparent, which comes true to seed; but three *yellow wrinkled;* and three *round green*—these latter ones being wholly new kinds, so far as their direct ancestors are concerned. And yet these also will come true to seed, and thus are not hybrids, but pure bred.

These three yellow wrinkled and three round green peas have been made directly by our method of combination, expressly manufactured, if you please. And if we were to go on to combine *three* pairs of contrasted characters, or more, the results, while still more complicated, can nevertheless be worked out and explained and even predicted with precision, though several quite new types may have been originated in this way. The many wonderful new types produced by Luther Burbank have been chiefly originated by direct and purposed crossings.

In the year 1910, a red sunflower was discovered growing by the side of the road near Boulder, Colorado. Now the sunflower must have pollen from some other individual plant in order for its seeds to be fertilized, or in other words, it must be cross pollinated to develop perfect seeds. But there were no other red sunflowers with which to cross this stranger. So it was crossed with an ordinary yellow. Fortunately, the red color proved to be dominant; and several pure bred reds were obtained.

The Case of the Sunflower

SOME time before this, the English growers had developed a so-called "primrose" sunflower—a very light or straw-colored yellow, like the evening primrose. What would happen if this primrose sunflower were crossed with one of these pure bred reds? The crossing was done; but, sad to say, nothing but reds developed. This was a disappointment; and if the experimenters had not known anything about Mendelism, or if all this had happened under the old régime of 50 years ago, probably the experiment would not have been carried any further.

But the experiment was continued, these disappointing reds were allowed to cross, and their seeds were planted. And in the next generation two wholly new types appeared or were separated out, as the Mendelians say. A certain percentage of the total plants was red, like one parent; another percentage was primrose-colored, like the other parent. But a certain percentage was of a *wine red* or *old rose* color; while a certain percentage of others was of a dark *orange* color. Of course, both these old rose and orange sunflowers were wholly new types. It is probably safe to say that such colors in sunflowers had never been seen on earth before; for such combinations as produced them could hardly be imagined to occur naturally. But certainly, if either of these types had been found growing wild and we had not known its method of origin, and especially if this new and strange color had been accompanied (as it might easily have been) by new forms of leaf or of other habits of growth, we should most certainly have called it a *new species;* and there is not much doubt that hundreds and thousands of just such Mendelian segregates have been listed and described as true species, among plants, and birds, and insects.

Many other new kinds of plants and animals have thus been manufactured in the seed patch or in the breeding pen, kinds which if found wild in nature would forthwith have been listed as "new species." As Professor William Bateson said in his address before the British Association for the Advancement of Science at Toronto, December 28, 1921: "Plenty of Mendelian combinations would in nature pass the scrutiny of even an exacting systematist, and be given 'specific rank.'"

Have we then solved the old problem of the origin of species? Does this let us into the secret of how new types of life have originated in nature? And do we now only need to project these modern laws and processes back far enough into the past to account for not only species, but genera, and orders, and classes? In short, does this new view of nature help us to see how one distinct type of life may have originated from some wholly different type of life?

When the laws of Mendelian combinations were first made familiar to the world at the beginning of the present century, many loudly proclaimed that the riddle had at last been solved. But further experiments and further study of the real results thus obtained have dashed the hopes of those who were looking to these new facts of genetics for light on the general problem of organic Evolution.

As a recent biological writer has stated the matter:

"I well remember the enthusiasm with which the Mendelian theory was received, when it was introduced to the scientific world in the early years of this century. We thought that at last the key to Evolution had been discovered. As a leading Mendelian put it while the rest of us had been held up by an apparently impenetrable hedge, namely, the difficulty of explaining the origin of variation, Mendel had, unnoticed, cut a way through. But, as our knowledge of the facts grew, the difficulty of using Mendelian phenomena to explain Evolution, became apparent, and this early hope sickened and died. The way which Mendel cut was seen to lead into a *cul-de-sac.*"

Some years before he died, Alfred Russel Wallace stated in more detail the reasons why Mendelism does not help the general theory of organic Evolution:

"On the general relation of Mendelism to Evolution, I have come to a very definite conclusion. This is, that it has no relation whatever to the Evolution of species or higher groups, but is really antagonistic to such Evolution! The essential basis of Evolution, involving as it does the most minute and all-pervading adaptation to the whole environment, is extreme and ever-present plasticity, as a condition of survival and adaptation. But the essence of Mendelian characters is their rigidity. They are transmitted without variation, and, therefore, except by the rarest of accidents, can never become adapted to ever-varying conditions."

Darwin Made Light of It

BUT there is a further difficulty. Natural species are almost invariably cross-sterile with one another, even when we take the utmost pains to try to cross them; whereas the new kinds which we have developed under Mendelian methods, or which we have produced under domestication among plants and animals, are almost as invariably cross-fertile with one another. Darwin rather made light of this barrier of cross-sterility which nature has erected between natural species; but modern scientists see in this barrier something which we cannot produce in any way, and which we have never seen arise either naturally or artificially; and in this barrier we have something which it seems effectually differentiates natural species from those Mendelian segregates which we can easily produce artificially.

Accordingly, while it is entirely believable that such wild "species" as the two kinds of elephants now alive in our modern world, the Indian and the African, have somehow come from one stock, and that both of them may be truly the genetic relatives of the mammoths and the other elephants found as fossils in the rocks of both America and Europe, it is quite inconceivable that the elephant and the rhinoceros, or the elephant and the camel, can be related to one another by any line of common ancestry, no matter how far back we carry the line. It may be possible, or even quite probable, that all of the many species of the Cat family (*Felidae*) have had a common origin; or that all of the wild and domesticated pigs (*Suidae*) may be related to one another by descent. It is conceivable that the apple, the pear, and the quince may be genetically related; or that the plum and the peach may have had a common origin with the almond. Yet it must be confessed that we *cannot prove* this common origin of even these apparently related forms. As for the idea that even more unrelated forms may have had a common origin, these modern investigations seem to render such a thing even more improbable than it used to appear before the days of Darwin or Lyell or Lamarck.

No Law to Point to

DR. BATESON very tersely expressed it:

"That particular and essential bit of the theory of Evolution which is concerned with the origin and nature of species, remains utterly mysterious. We no longer feel, as we used to do, that the process of variation, now contemporaneously occurring, is the beginning of a work which needs merely the element of time for its completion; for even time cannot complete that which is not yet begun."

The modern studies of the *chromosomes,* which are the parts of the cell nucleus supposed to be the carriers of the factors of heredity, are also emphasizing all these points which we have just been speaking of in connection with Mendelism. And accordingly, while our enlarging knowledge may make it seem probable that multitudes of forms which we call distinct species may have had a common origin, it must constantly be emphasized that we have not proved such a thing scientifically, nor can we point to any known process or law of nature by which this differentiation into species may have been brought about.

But what about the general doctrine of Evolution, in the larger sense? Is there more or less probability now than 50 years ago, that the mammals may have sprung from the reptiles, or the birds from the reptiles or amphibians, or the latter from some of the lower orders of life? What about that ever-present problem of the origin of Man from something like an arboreal or a walking ape? Is this more probable now than it appeared 50 years ago? Or is it less probable?

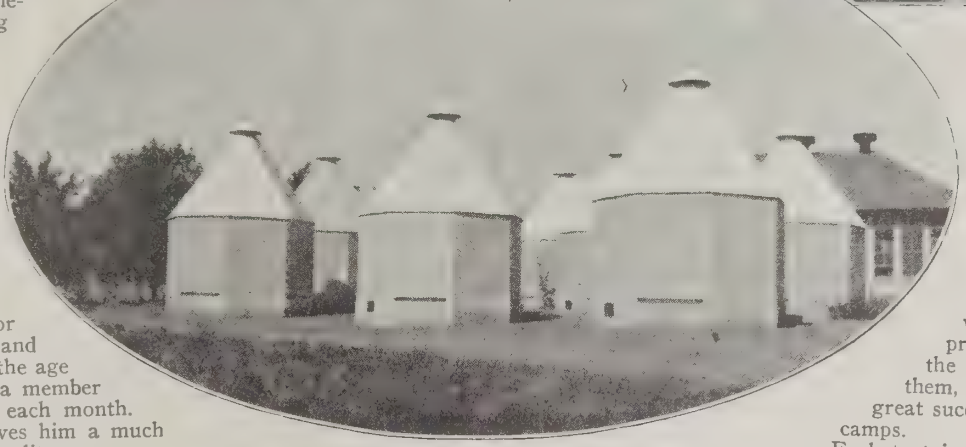
It seems to me that this general idea of Evolution,

(Concluded on page 14)

Where Union Typos Regain Their Health

Old Days of Hand Composition Brought About Conditions of Health That Members of Craft Banded to Abolish

The main building, Union Printers' Home.



These canvas houses are restoring tubercular printers to health.

By MARK G. TROXELL

IN THE days when hand composition was the rule in printshops, printers were especially liable to contract tuberculosis. This fact caused leading printers, about the middle of the last century, to discuss ways and means for combating the disease among their fellows. The result of their early agitation may be found today in a $3,000,000 institution at Colorado Springs, where virtually one-half of the tubercular patients are being cured of the disease.

The Union Printers' Home is today the only institution of its kind in the world. Supported by the able-bodied members of a trade, always noted for the high average intelligence of its workmen, it furnishes an asylum for the disabled. No charity exists here; every man who enters as a patient or a retired worker knows that he, as well as every other member of the home, has for some years previous contributed to its support. Nor is the veteran compositor dependent alone on institutional board and clothing. The printer who has reached the age of 60, and who has for 20 years been a member of the union, draws a pension of $35 each month. This sum is used as he sees fit. It gives him a much desired freedom in regard to small expenditures.

The spirit of a famous American patriot permeates the Printers' Home. A statue of this remarkable man stands in the reception room of the main building, and before this sculpturing an old "make-up man" paused reverently.

"Ben Franklin was the first man to make American printers famous and respected," declared the old comrade. "He invented machinery and gave advice for all people, but we never forget that he was first and last a great printer."

This home in the golden West has incorporated into its life many of the virtues emphasized by that industrious old sage who feared neither poverty nor riches.

"Make no expense but to do good to others; waste nothing," urged Franklin. At the Printers' Home his advice has been literally taken. The farm lands adjoining the buildings have been made to produce bumper crops of alfalfa, corn and beans. Seventy Holstein cows furnish the nourishing milk and butter needed by men seeking to recover lost health. Both greenhouses and gardens are intensively cultivated. The kitchens show the careful cleanliness and economy of an establishment that wastes nothing.

The great library offers almost every kind of volume that a widely read man could desire; yet its humble growth, as described by the old make-up man, is strangely reminiscent of that library in colonial Philadelphia which Ben Franklin persuaded his friends and associates to start by the simple process of pooling their books.

"At the time I established myself in Pennsylvania, there was not a good bookseller's shop south of Boston," Franklin once wrote. "Those who loved reading were obliged to send for their books from England. I proposed that we should all bring our books to our hired room, where they should become a common benefit, each of us being at liberty to borrow such as he wished to read at home."

Finding this arrangement to be a great advantage, Franklin conceived the idea of having each user of the library contribute a certain amount (40 shillings, or $10) with which to buy books to be owned in common. From his subscription library plan—to which he was able to convert only 50 Philadelphians of his day—gradually evolved the public library system of our own times.

Few persons today know of Franklin's struggles to establish a semi-public library, but apparently the old printers who founded and developed the library in the home at Colorado Springs were familiar with the Franklin plan. Certain philanthropic typesetters donated their little collections of books; early boarders at the home "chipped in," recognizing the economy of buying books in common rather than for individual use. As the number of printers at the home increased, votes were taken to decide what newspapers would be popular with the largest number of readers. Today the news racks give an insight into the tastes of these old typos; and it is significant that a Washington paper, famous for its political news, and a New York sheet, noted for its "racing forms," are prominently displayed among others which more truly represent the states where the printers originated.

The most remarkable scientific fact about the home is its successful treatment of tubercular cases.

The main building is divided by an invisible but powerful line. In the southern half, with its sunny exposure, are found the tubercular patients. In recent years these have increased—as the fame of the home grew greater—and additional buildings for their care have been erected. The open air pavilion, with its long, odd-looking wings, accommodates 30 patients, and the three-story hospital cares for many more.

The mainstays in fighting the white plague, however, are the conical white tents which dot the grounds east of the pavilion. As early as 1904, tents similar to these were given a thorough test. They proved so successful that not only has the printers' sanatorium made wide use of them, but the idea has been adopted with great success by many other Colorado tubercular camps.

Each tent is built to give a maximum both of protection and of fresh air. Although each tent appears from a distance to be conical, it is in reality hexagonal. It is built on a strong framework and covered with 15-ounce canvas, securely anchored. This makes it impervious to rain and wind. Ventilators in the floor and the peak assure good circulation of fresh air. Steam heat and electricity make the tent comfortable during all kinds of weather; and a system of electric bells and red lights (in front of the door) enables a patient to bring a nurse immediately, should any emergency arise.

The outdoor life in these tents and the nourishing milk diet furnished by the home help to explain the remarkable percentage of cures effected by the hospital. Fifty per cent of the men who have entered as tubercular patients have regained their health and been able to re-enter some gainful occupation. It is worth pointing out that, years before the fresh air cure was generally practiced in the East, this home was taking advantage of the Colorado climate as an aid to health. Also, it might be mentioned that a diet containing all three vitamines (a fourth now seems probable) was furnished at the Printers' Home for a decade before Dr. McCollum announced his discovery of vitamines.

The location of the home is beautiful and healthful. Facing the eternal snows of Pike's Peak, it occupies a plateau to the east of Colorado Springs. Looking across the northwest corner of the evergreen-dotted lawn, the old printers can discern the rosy sandstone piles that mark the Garden of the Gods. The clear slash of the cog road which climbs Mount Manitou may be seen from the stone arch that guards the entrance to the grounds.

The rewards that an arid country grants him who will furnish water have been richly reaped at the Printers' Home. Seldom in this country can one find a wider variety and more brilliant array of flowers. Each garden is tended with pride and care; each flower bed is the recipient of many appreciative gazes from old men who have time to take pleasure in Nature's beauties.

The home of today, valued at nearly $3,000,000, grew from an 80-acre tract, given by the city of Colorado Springs, and about $26,000 received by gift and assessment from printers prominent in the union's affairs in 1889. Forty years before that time, the idea of such a home had been strongly urged, and subsequent conventions had attempted to establish it, but had failed. George W. Childs was the most prominent of the early workers for the home, and his unselfish, untiring efforts caused the opening celebrations to be set for his birthday. The great day was May 12, 1892. A poem for the occasion was written by Eugene H. Munday, the poet printer, and Senator J. H. Gallinger, of New Hampshire, himself an old printer, came from Washington to make the principal address.

The growth of the home since that memorable day has been solely due to the willing contributions of American typographers, combined with the industry and loving care shown by the men who enjoy its pleasant walks and lawns. Each year has brought an increasing pride, on the part of printers, in its creditable record. There is no likelihood that it will ever lack funds. If more buildings and money are needed, the men who work at case and machine will see that they are supplied.

The Gateway.

Almost every variety of western evergreen is found in the corner of the grounds.

When Indians Tell Spooky Fairy Tales

Old Folk Who Nest in the Caves and Crannies of Southern Mountains Live Continually in the Fear of the Likelihood of Facing a Ghost

By HARRY E. BARNET

LIKELIHOOD of facing a spook any minute is the biggest fear of very old folks who nest in coves and crannies of the southern mountains. For they are mixed descendants of many sorts of pioneers. Each group brought with them folklore that was different, and tinged with the antics of phantoms. Furthermore, the pioneers ran into a lot of mountain Indian beliefs of the same stripe. When in the course of time, these sets of folklore became entangled the result was a combination of hair-raising superstitions about spooks that govern everyday life. As an instance:

"None 'v them 'ar ol' folks, which they live back yonder in them 'ar coves, they hain't a-goin' near t' no spring for water when hits dark, they hain't, if they're a-burnin' up fer a drink," is the statement of Jim Allread, mountain lawyer, and authority on superstitions in that country—he knows them all, and he believes in the majority of them.

"No, sir, they hain't," Jim concludes, "fer them 'ar real ol' spooks, they stay 'round springs, they do, an' them 'ar ol' spring spooks, if they ketch ye, they'll do mean devilmint t' ye."

This is one of the few statements Jim fails to follow up with an explanation. He says it's common knowledge, and there is the end of it. But the fact of the matter is, Indian contribution to this southern mountain patchwork of superstition provides the extreme horror, though nowadays the actual stories that created it have almost disappeared. It is doubtful whether a dozen people living in the mountains ever heard these tales as they originally were told. Only the vivid, and somewhat distorted impression they left has been handed down to generations that are alive.

Darkness Brings Fear

FEAR in the vicinity of springs after nightfall is in part the outcome of the very ancient Indian belief that just below the surface of the earth is an underworld. With the exception of reversed seasons, it is like our own. Mountain streams are the highways to this underworld, and entrance to it is through springs. People, plants and animals there appear to be the same as in our world, but they are ghosts, who either are very good or very bad.

As the original story went, the most malignant specters were the water cannibals. They lived beneath the bottoms of deep rivers. At daybreak they came out through the springs, and, unseen, went from cabin to cabin, until they found someone asleep. Then they shot the sleeper with an invisible arrow, and carried the dead body under the water to feast on it. That no one might know what happened, they left in the place of the body an image of the victim, who woke up, and talked, and went around, just as the victim did in life. But there was no vitality in the image. It withered and died in seven days, and was buried by the family, who thought they were burying a relative.

This went on for a long time before the Indians knew what it was that caused so many deaths. Then an Indian took sick near what is now Kingston, Tennessee. He grew worse, and the medicine men said he was bound to die. His friends went away from the cabin, and left him alone—they were afraid of the witches who came to torment dying people.

This Indian was alone for several days, not able to get out of bed. One morning an old woman came to the door. She had the look of any other woman of the settlement, but the Indian did not know her.

"You are very sick, and your friends seem to have left you," she said, as she neared the bed. "Come with me, and I'll make you well."

The Indian was so near death that he was unable to move, but the words of the woman stimulated him, and he asked her where she wanted him to go.

"We live close," she said. "Come with me, and I'll show you the place."

Leading the way, the woman went to the river. The Indian followed. When she came to the edge of the water she stepped in, and still the Indian followed. Beneath the water was a road, which the couple followed, and presently they came to a settlement. There were dozens of cabins in it. Women were going about their work, and groups of children were at play. A party of hunters passed the Indian and his guide, but instead of having bear and deer quarters hanging over their shoulders they carried the bodies of dead men and children. Several of the bodies the Indian recognized as those of his own friends.

"This is where I live," the woman said at the entrance to a cabin.

She led the sick Indian indoors, and arranged a bed for him. By this time he was very hungry.

"I'll get you something to eat," she said, reading his thoughts.

From one of the bodies brought in by the hunters, the woman sliced a roast. The Indian was frightened.

"I see you can't eat our food," she said, again reading his thoughts.

She left the room, and when she came back her hands were filled with bread and beans, such as the Indian had at home. This procedure continued each day, until the sick man was well and strong.

"But you must be sure not to speak to any one for seven days," the woman said to him after she told him he might go home. "And if any of your friends try to talk to you, make signs as if your throat is sore, and keep quiet."

Return was over the same trail, and at the water's edge the woman turned back. The Indian continued to his home. When his friends saw him they were surprised, for they thought he wandered off, and died in the woods. They asked him where he had been, but he pointed to his throat, and was silent. His people thought he still was sick, and let him alone. At the end of seven days he told his story. After that time, Indians made it a point to be awake and stirring before daybreak.

"The water cannibals are coming," squaws said when they shook sleeping children, and the youngsters jumped out of bed in a hurry.

Another tale concerned a hunter, who was in the woods one day in the dead of winter. Suddenly a panther approached, but when he was about to shoot it the animal spoke to him.

"Where are you going?" asked the panther.

"I'm looking for a deer," the hunter replied.

"Well, we're getting ready for our Green Corn Dance, and there are seven of us out for a fat buck, so we may as well hunt together," said the panther.

The hunter agreed, and they went on. One deer after another jumped up ahead of them, but the panther made no sign of pursuit, and the hunter did not shoot.

"They're too small," the panther said. "We want something better."

Spirit People of Mountains

WHEN a large deer sprang up before him, the panther jumped at it, tore its throat, and finally killed it after a hard struggle. The hunter got out his knife to skin the deer, but the panther said the hide was too badly torn to be useful, and that they must find another deer. A larger deer sprang up, and the panther killed it without any trouble. Wrapping his tail about the carcass, he threw it across his back.

"Now, come with me to the Green Corn Dance," he said, and the hunter followed.

Carrying the deer carcass on his back, the panther led the way up a little stream until they came to the head spring from which it flowed. The spring opened like a door, and they entered. The hunter found himself on a grassy place, with green trees on all sides of it. The air was warm, as in summer. Hundreds of panthers were there, getting ready for the dance. Later, the other panthers who were deer hunting returned, each with a fat buck, and the dance began.

The hunter danced several rounds, then he said it was getting late, and he must be going home. A panther opened the door, and the hunter found himself alone in the woods. It was winter, and very cold. Snow covered the ground, and clung to the trees. When he reached the Indian settlement he met a party starting out to search for him. They asked him where he had been, and he told the story. Then he was told he had been gone for several days. But the hunter died within seven days, for anyone who went into the underworld, and told about it within seven days after his return was sure to die without delay.

Immortals were spirit people who lived anywhere in the southern mountains, according to Indian belief. They were reputed to have had a good many communities, particularly under Pilot Knob, beneath old Nikwasi mound in North Carolina, and beneath Blood Mountain at the head of Nottely River, in Georgia.

Excepting when they wanted to be seen, these spirits were invisible. They liked to dance, and the dance songs and drum beats of the Immortals were familiar sounds in the mountains But when any one tried to locate the sound, and to go toward it, the sound shifted, so that no one ever found the place below the earth where a dance was going on. Occasionally the Immortals made themselves visible, and attended Indian dances. Four women did this throughout a whole winter in Georgia, and during that time they were taken to be visitors from a neighboring Indian settlement. One night the women left the dance to go home just as some Indians came out to cool off. The latter watched the women to see which way they went. They saw them go down the trail to the river. When they reached the water's edge they disappeared, and never again were seen.

Immortals were friendly. They took lost Indians to their underground communities and cared for them, and then guided them back to their homes. And, they were fighters. During the war between the states, it is claimed that when a strong party of Federals came to the vicinity of Nikwasi to surprise a small detachment of Confederates posted there, Immortal warriors, invisible to the Confederates, but plain enough to the Federals, came out in such numbers that the attack was abandoned, because so many soldiers were seen guarding the town.

Long before that time, an aboriginal raiding party came into this country from the southeast. They killed Indians, and destroyed settlements in the lowlands, and were repeating the performance in the highlands. No set of Indians could stand against them. All of the Indian families in the vicinity were gathered in the Nikwasi settlement, and scouts were sent out to look for the enemy, who were sighted at daybreak. The Nikwasi men went out to meet them, but after a long fight, they were overpowered, and began to retreat.

Could Not See the Foe

SUDDENLY a stranger stood in the midst of the fleeing warriors, and told their chief to call off his men; that he would drive back the invaders. No one knew the stranger, but it was thought that he was a chief leading reinforcements from the Tennessee settlements. The Nikwasi Indians withdrew along the trail, and when they came in sight of Nikwasi mound they saw a multitude of warriors coming out of the earth. They knew then that the reinforcements were Immortals, though up to that time no one knew they lived beneath the mound.

Painted and armed for battle, the Immortals poured out of the earth, and became invisible as soon as they were beyond the settlement. The enemy saw arrows flying at them, and tomahawks descending upon the heads of their men, but they could not see who did this. So many were killed that the invaders had to retreat. As they withdrew they tried to shelter themselves behind rocks and trees, but the arrows of the Immortals went around the shelters, and killed the enemy from the other side. When but six of the attacking party remained alive, they sat down and cried for mercy. The Immortal chief told them they deserved the punishment they got for attacking a peaceful tribe, and sent them home to spread the news among their people. The Immortals returned to the mound.

Evidence of the presence of Immortals in the southern mountains was abundant. A short distance north of Blood Mountain, hot vapor that in winter heated the air for some distance around it came from a hole in the ground. This was a favored resort of Indian hunters, who went there to warm themselves. But none of them stayed longer than was necessary. They believed the heat came from a fire in a community of Immortals directly beneath the place, and were afraid. Close to an old trading path from South Carolina to the Cherokee Nation, near the head of Tugaloo, was a famous hole of immense size, and about waist deep to a man. Indians claimed this was a dance place of Immortals. Trash never accumulated in it—the hole always had the appearance of having been recently swept clean. Traders threw rocks and logs into this hole when they passed it. On their return they found the logs and rocks lying far away from the hole. Indians avoided the place, and even refused to talk about it until after some logs thrown in by traders remained in the hole, when the Indians concluded the Immortals tired of persecution by white men, and went elsewhere.

Spook stories give you the creeps when you hear them under the most reassuring circumstances. And, at best, pioneers in the highlands mistrusted Indians. Imagine such Indian folklore as these stories, told and retold at night in wild solitudes by illiterate generations; distorted and mingled with tales about Irish banshees, and other Old World beliefs and you know why Indian folklore is the groundwork for the superstitions that make life uncomfortable for the old folk who nest in the southern mountains.

Why Old World Leads in Making Textiles

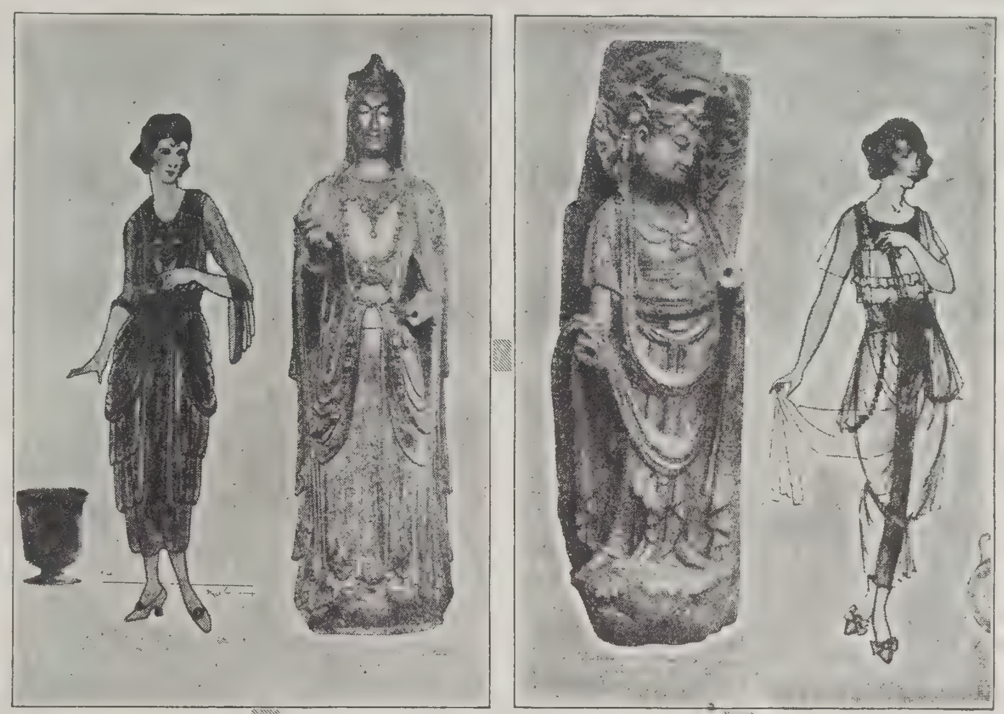
Statues of Old Showing Draperies of Centuries Ago Furnish Inspiration

By WILLIAM A. M'GARRY

THE secret of why the Old World leads in the designing of textiles, ceramics and furniture of the more expensive art types, to say nothing of women's gowns, is out at last. It has been traced by experts in such things at the museum of the University of Pennsylvania back to ancient Greece, to Rome, to Egypt, to China of seventh century artistic and cultural leadership. And so thoroughly has the museum succeeded in inculcating into manufacturers of those things in the United States the idea that all superb art is only a slow growth, the result of centuries of painstaking toil toward an ideal, that these producers have torn a page from the book of the Europeans.

That is one reason why, in the opinion of artists and experts, in many lines of textile manufacture the modern product equals the finest produced in any age, and in some instances exceeds in beauty and utility all previous productions. The same might be said of certain other American products that have reached a stage of artistic perfection equal to or better than the most marvelous work of ancient craftsmen whose methods were lost arts until recent years.

It is now many years since the news was flashed to America that Paul Poiret, the famous French designer of women's clothing who visited this country recently, had invented what was familiarly called the "debutante slouch" gown. But most Americans—even those in the business of designing and making dresses—did not know that the inspiration for the clinging lines of the slouch gown came from a statue in the Louvre, somewhat similar to that of the ancient Chinese sculpture in the university museum, familiarly called the "Chinese Venus de Milo." At just about that time, however, the museum began a campaign to interest designers employed by manufacturers in its exhibits, coming from all corners of the world and representing every civilization in or before recorded history.



How the work of the ancients proves inspiration for designing of modern gowns.

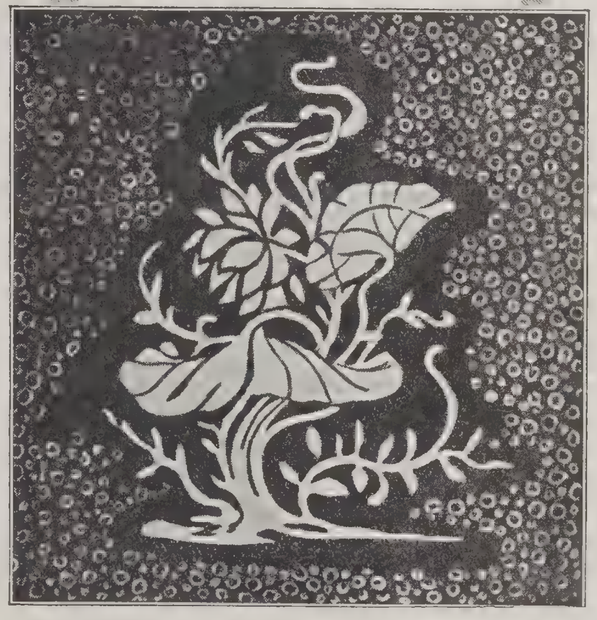
By way of illustrating how the idea has taken hold, and some of its possibilities, the museum has now made public photographs of several designs copied from ancient relics. They show how the makers of lace have learned new tricks of beauty from the lace makers of forgotten Peru; how manufacturers of print cloth have borrowed from the exquisite porcelains of old China; how the silk mill owners have caught new inspiration for drapery silk designs from priceless antique Persian velvets. And then, just to show that this source of inspiration is not limited to any one industry, the institution has obtained photographs of dainty evening gowns and house dresses, the lines inspired by the flowing garments on Chinese sacred statues, the color schemes borrowed from examples of the delicately tinted glass for which ancient Rome was famous.

"The student is perhaps the most vital factor in giving out the message content of the museum," says the announcement accompanying the illustrations. "He is the future artist, architect or designer, as the case may be. As such, he becomes, through the medium of his own creation, a most potent disseminator of the wealth of information the museum holds. His work in due time passes into the hands of the manufacturer, who in his turn reproduces the design in the form of his particular product and this rug, textile or ceramic, whatever it may be, eventually reaches the buying public.

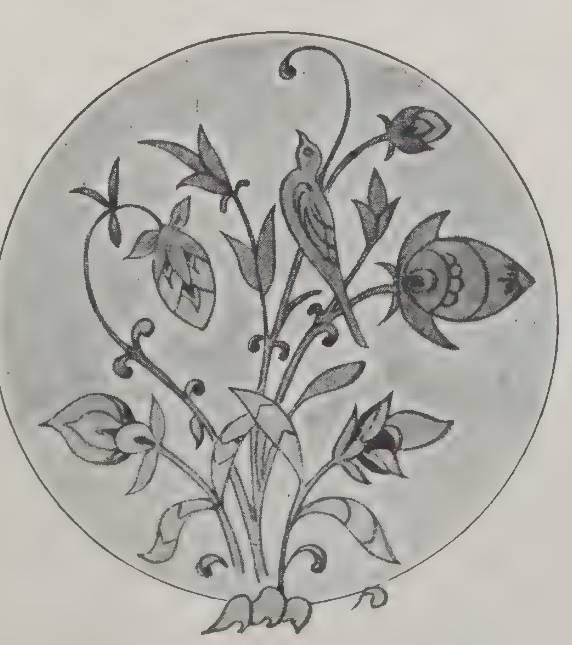
"In the last analysis the manufacturer becomes the arbiter and it is distinctly his mission to choose wisely and with constructive judgment as to the designs he is to give out to the world, embodied in his product. Let it be said that this is precisely what our great manufacturers are doing, with the result that in many lines of textile manufacture the modern product equals the finest produced in any age, and in some instances is said to exceed all previous effort. This is but a reflex of the wisdom on the part of the manufacturers to send their skilled designers and technicians to the museums to study the finest work of all ages in their particular line. This designer is our student in advanced guise, who is already familiar with the treasures the museum offers for his study and who has found out that his own imagination and technical knowledge take fire more rapidly when kindled by museum opportunities.

"European designers, knowing perhaps more certainly than we that all art is related with that which has preceded it, have never hesitated to make full use of their great museum collections. Each age and time has laid its particular stone upon the foundation we know as beauty, and each stone has had its value in the structure; absurd it is to try to sweep aside this slow builded creation, and yet there have been many recent attempts to do so. These are responsible for the 'bad art' which from time to time has descended upon us. Such departures will not be made when such a cultural campaign as is now being waged by museum, designer and manufacturer, reaches the full climax of its capacity."

In that connection it is interesting to note that American museum experts revealed a few years ago what is said to have been the inspiration of futurist, cubist and similar exaggerated forms of art in painting and sculpture. Exhibitions of early African wood carving were shown, many of which bear a marked resemblance to the futurist representations of human figures. The use of ancient masterpieces as models has been a familiar thing in architecture and in painting, but it is only in recent years that the idea has been grasped by manufacturers. Every city has its touch of early Greece and Rome in its public buildings. Now the time is coming when the beauty that was Babylon's will be seen on every street.



Motif of design for printed foulard, derived from a Ming enamel in the museum.



Motif for a design for drapery silk derived from a Persian velvet in the museum.

A particular instance of the value of that form of inspiration cited by the museum is of a group of young girls, all students of the Philadelphia School of Design for Women in the class of costume design and illustration, who have been at work at the museum. The students went there with a definite problem; their instructor had told them to design a gown, the inspiration for color and line for the garment to be obtained from something in the collections, no matter of what land or time. Though that was the first experience of the class, experts found the results gratifying and the inspiration in several cases drawn from sources supposedly requiring sophisticated attention.

"It is highly gratifying to a teacher," said one of them, "when a first-year student produces as creditable a design as that of the young woman who found in the Chinese stone statue of a Bodhisattva, lines that were admirably suited to the design of a tea gown, and who adapted the same for her design, using as a color scheme the color notes found in a particularly lovely bit of Roman glass."

At later visits of the same class Greek vases furnished ideas both in line and color for smocks and tunics, and Chinese porcelains and enamels gave rich suggestions for color scheme and ornament for many a gown. A great source of delight and a veritable mine of suggestions, according to the museum authorities, was found in the group of Peruvian textiles in which the museum is particularly rich. "The Coptic textiles," it is stated, "proved to be a source of pleasure to many who were interested in creating designs that involved the use of embroidery. A fashionable filet crochet sweater was derived from the pattern and weave of one Peruvian textile and the museum became a new thing to many of the girls, because of this simple investigation which showed how the arts and crafts of yesterday might be linked with the dress and occupations of today."

Any observer of present-day fashions will note that the use of museum exhibitions as inspiration for design is not confined to students. Draperies which have been so popular in recent years find their early counterpart in the clinging garments carved on the stone figures of Buddhist saints. Even the patterns of present-day silks and brocades were known more than 2,000 years ago, as evidenced by the indelible records left on gorgeously colored vases. And in that connection note the following from the university museum:

"It would have been perfectly possible to take this class and put them down in front of a group of costumes with instructions to derive their designs therefrom; this is a stereotyped method and entirely valuable at certain stages of the student's development, but working in the more synthetic way, the student contracts the habit of going about the museum with eyes and mind open to all influences instead of having a distinct bias toward an interest in one particular thing. The resulting training is, of course, of wider art value and education than it could possibly be otherwise. It may be interesting to note in passing that some of this same group of girls are today designing for leading tailors and modistes, for leaders of society whose gowns are particularly noteworthy; others are illustrating modern costumes for the daily press and magazines, and all are doing highly creditable work.

"The better known class of designer, the designer of silks, wall paper, rugs, textiles for decorative purposes, such as cretonnes, brocades, chintzes, lace curtains, of such utilitarian products as linoleums and oil cloth, is much more in the public eye because his result is ever with us in its many guises. To him the museum offers a very fertile field, as almost every piece of textile or ceramic offers a suggestion. Suggestions of designs for printed foulards were derived from some of the blue and white Chinese porcelains. The design is not copied precisely as seen upon the porcelain, but adapted so as better to suit its use upon the surface of silk as a piece of feminine apparel. The taste of the designer and his power of selection must always come into play in such adaptations, for he must preserve the distinctive character of the motif and at the same time make it appropriate for the new use.

"The museum is in no way more truly at the service of the public than in this constructive work of guiding and aiding the student, designer or craftsman who comes to it for help. He most certainly finds that which he seeks and, as a consequence, in his work endows us with a translation of the beauty that was once Egypt's, let us say, and gives us in terms strictly modern and his own, our place in the great history of art production. He thereby makes our modern designs a link between the ages."

Yes, Chicago IS Shocked by Appalling Story

Concluded from page 3

ing the new dances with Negro men. Raids on these places have made up the bulk of routine police reports in the newspapers.

Federal court injunctions obtained against some of these resorts under the Volstead Act revealed that the Negro proprietor was frequently backed by an alien—the aliens interested in such places were usually Eastern Jews, South Italians and Sicilians with a sprinkling of other races.

The situation in this quarter of Chicago is such today that there are many hard-headed business men who have declared privately that unless there is a drastic change Chicago may well fear a serious race upheaval. The peril has actually been alluded to in the newspapers and thousands of the respectable Negro residents have struggled to have the resorts cleaned out.

If the present vice probe is carried to its logical conclusion the decent Negro element in the district will deserve the credit.

The situation on the South Side was called to the attention of Chief of Police Charles Fitzmorris more than a year ago. Chicago believed in Fitzmorris. He pledged himself to a clean city and asked the aid of all good citizens.

In response to his call one of the city's wealthiest and most prominent citizens stepped forth. Who? None other than Julius Rosenwald. Mr. Rosenwald has devoted a large part of his wealth to Negro institutions. Indeed, many Negro institutions are officered by Jews.

The Committee of Fifteen was formed as an independent civilian organization to suppress vice. Mr. Rosenwald was its chairman! Many prominent citizens were persuaded to join it. They are now resigning rapidly, four having quit in four days because they couldn't find out why the Committee of Fifteen leaders insisted there was no vice, while private investigators imported from other cities by other organizations found 200 houses and 1,000 inmates in 20 days of investigation and found that a big majority of these places were directed by the syndicate.

And then came the first meeting of the committee to make its plans to curb vice.

There was much talk and no action—and then the money came from a source which might have been considered entirely unexpected then, but which is causing considerable comment now.

Chief Fitzmorris stepped in and volunteered to supply the funds.

"I can furnish money for a committee of this kind from my contingent fund," he said. His offer was accepted and, according to committee members, $8 000 was turned over to pay investigators. So, the civilian committee, formed to act as a check on the police department and to see that it curbed vice, began work with funds furnished by the police department.

"We had better announce this with some kind of an explanation," Mrs. Joseph T. Bowen told the committee.

"No, if we do, we will have trouble getting any funds at all from private citizens if we have to ask for them," Rosenwald is quoted as saying.

"That's right," was Fitzmorris' opinion. "And I might have trouble getting the appropriation I want if the council finance committee hears of it."

It was kept quiet, but it was made public during the present investigation. *And then came the testimony that investigators for the anti-vice Committee of Fifteen were protecting vice themselves and accepting bribes!*

Formation of the Committee of Fifteen, with Rosenwald as chairman and Samuel Thrasher as manager, had apparently meant nothing to the vice lords, for their activities only spread farther and farther and became more and more open.

The Juvenile Protective Association learned of the slavery of 14, 15, 16 and 17 year old girls and immediately started to find out why, and to attempt to answer the muchly jockeyed question, "Who is responsible?" *To make sure they were not double-crossed they sent to New York for a trained investigator.*

Investigator Kinsey, who has been the star witness of the present probe, arrived in Chicago with no previous knowledge of the city. Where Chief of Police Fitzmorris and all his men, State's Attorney Robert Crowe and all his henchmen and Julius Rosenwald and his Committee of Fifteen, with its battery of sleuths, had found only "traces" of "casual vice" Kinsey in 20 days found:

> Two hundred vice houses conducted on business principles, in charge of Negroes, with white girls for sale.
>
> Twenty-five streets on which vice openly flaunted itself.
>
> Eighteen cabarets run by Negroes but crowded with white women.
>
> Twelve saloons where the bar keeper after selling a drink voluntarily recommended some vice resort to the customer.
>
> Thirty-three "hotels" devoted to vice.
>
> Dozens of street corners picketed by "cappers" who sought business for neighboring vice resorts, openly and in the hearing of policemen.

Another outside investigator sent over the same route checked up Kinsey's work and confirmed it in every respect. Later a third investigator from a third city was brought in to check the first two—with the same result.

All this was found in a city where the civilian anti-vice Committee of Fifteen under the chairmanship of Julius Rosenwald and through its mouthpiece, Samuel Thrasher, used a horn to tell the world that the police department under Chief Fitzmorris had the vice situation well in hand and only sporadic and spasmodic violations could be found.

With its thrice confirmed information, the Juvenile Protective Association went before Chief Justice Michael McKinley, of the criminal court, with a petition asking that the grand jury investigate vice, which, it declared, "openly and flagrantly existed under the protection of politicians, wealthy private citizens and the police department."

Judge McKinley, a fearless judge who has had to play a lone hand, immediately granted the petition and charged the jury to investigate.

For two nights virtually every resort in the city closed. Then a notorious resort, protected by one of the highest officials in the city, announced that it was again ready for business. Soon all the places were open again and many are open today—*open because word went out from the office of a state official that the investigation would be choked,* that it would be a farce, that only a few minor persons would be hit and that they would be protected from punishment other than indictment! This word went out officially through an official, *but this official did not correctly reckon the backbone and grit of Judge McKinley nor the caliber of some of Chicago's real leaders.*

Obstacle after obstacle is being placed in Judge McKinley's path. He has received death threats. His private telephone wires have been tapped. He is shadowed everywhere he goes. Anonymous letters as foul and villainous as they are untrue are sent to his family. Through it all he has stood pat. He says nothing, except that the investigation is going to get results in the end no matter what happens to him or whom it hits. In the criminal court building he is playing a lone hand, but, outside, the judge is going to receive help.

"Pitiless Publicity" That Has Become Pitiful

Concluded from page 8

or popular, news or educational articles are subordinated, for commercial reasons, to a mass of fiction. This, of course, opens the question of whether the general magazine, featuring fiction above serious reading matter, is not an anomaly.

Who buys the *Freeman?* Its editorials remind us that fearless and frank opinion has not been silenced. Its policies differ from The Dearborn Independent's in that the latter prefers to use its frankness as facts in its articles. Both magazines are the very antithesis of the *Saturday Evening Post,* and the latter's nearest competitor, so to speak, is *Collier's.*

The *Saturday Evening Post's* circulation of more than 2,000,000 copies is not, however, due to the non-controversial character of its contents, as its editors like to believe, but to its price; raise this five or seven times and the lack of controversial reading matter would be a boomerang. This popular weekly—an institution in the American publishing world—is essentially a fiction magazine. The place of honor is generally pre-empted by the first chapters of a serial, or a short story, or a comical skit, in the order named. The serious article seldom finds first place. This is the convincing proof that its editors regard articles as secondary.

Magazines like the *Atlantic Monthly, Scribner's, Century, Harper's* belong to the "quality group" according to the trade; their cost attests to that. Their survival is a constant renewal of hope in the breast that still cherishes a jealousy for the honor of the press.

The women's magazines are essentially class magazines, whether they be all-fiction or a combination of fiction, features and articles.

The *American Magazine* rolled up a satisfactory circulation by its "success stories." Yet *Success Magazine* a few years ago failed. Today the editorial world knows that "first person tales of achievement" have lost their fascination. In some cases they are maudlin self-advertisement.

Collier's, which a few years ago, when it featured the then popular Gibson drawings and also the Sherlock Holmes stories, has devised a new type of story—a mixture of the serious article and the "success" theme. Its aim is to address every reader in every story as "You." Yet *Collier's* too plays up its fiction—usually of a sportive nature—in the lead.

Mr. Munsey two years ago eliminated all articles from the monthly bearing his name because in his opinion nobody read articles any more. Shortly after the change, *Everybody's*—which made a name for itself for its articles and *not* for its fiction—followed suit. At the time of writing, the *Metropolitan* has gone into receivership, according to a newspaper announcement, and in editorial circles the cause is ascribed "to articles." But the cause is obvious.

The fate of the New York *Independent,* the occasional mention of the *Outlook,* both important weeklies of their time, may have confused pro-fiction editors and publishers, but the appetite for articles of the right kind was never greater than now. Witness the countless periodicals that are started. There is not a place for all of them, because most are palpably commercial ventures, but each manages to establish a following, no matter how inconsequential.

Mr. Munsey is further wrong because fiction has been displaced, in part, by motion pictures, and for a time even threatened by them. There have been a few fiction books during the past few years that became best sellers—but what is a best seller's circulation compared to the weekly circulation of the *Literary Digest,* which carries nary a word of fiction?

To say that American readers are beneath instructive reading matter is a slander. Their answer to the publishers who utter it is that books on travel, biography, economics and even politics are more popular than ever. Our publishing magnates have driven a potential reading public to seek its serious reading at the free libraries because such books are beyond the financial reach of average readers.

By their policy publishers have traduced the reading taste of some of our population. They, of course, fall back upon circulation figures—an ancient gag—but isn't the loss really due to the awful quality of reading matter they have fostered upon nearly helpless subscribers? What else can be the result when a publisher pays $50,000 to an illiterate circulation manager "with pep" and seldom pays as much as $10,000 for an editor?

Our newspaper editors, specifically, have disregarded that public opinion represented by the men and women who make no pretension of being smarter than they are. So far as publishers go, this class of readers is utterly ignored.

These editors declare that the American people don't want to read anything except the sporting page, the women's page, and the advertisements. That is true. Those selfsame editors take more trouble with the preparation of those three items than with all the other material put together.

And these, moreover, are the editors who have "their ear to the ground," when in reality it's on quicksand. A letter from a critical reader—one in a thousand but nevertheless an active minority—convulses them; but a hint from an advertiser has been the preliminary of many a blue editorial envelope. The loss of an editor or reporter means nothing to them; the cancellation of a subscription is nothing; but the loss of an advertisement—that is everything!

It has been alleged by these editors that because "they won't read serious stuff" Americans don't think. This view is now prevalent in Europe; Clemenceau's tour was due to such a belief; so is the other propaganda and lecturing.

The supposition may be true. Americans buy more printed matter than any other people and read it less, for obvious reasons—commended to editors themselves—but this has led to erroneous deductions. To see a foreigner read his pet editorial many times and then hear him argue its import with his friends may be a sign of erudition, but the fact is that in this country, where editorials are unread because of their usual wishywashiness, public opinion is swifter; it reacts immediately; it may not be scholarly but in its ensemble it is practical.

The American reading public soon gets the "hunch" about what is not right, even if not entirely wrong, with or without the aid of periodicals. And because of that hunch, a goodly part of our current periodicals are tolerated; they exist because their purchase is a habit and there is little else to substitute them.

This is the first of two articles; the second, Washington's Deathblow to the Newspaperman, by the same writer, will appear in an early issue.

What's So and What Isn't About Evolution

Concluded from page 7

and the theory of the animal origin of man, has a very distinctly less scientific aspect than seemed to be the case 50 years ago.

It used to be taught that geology gave us a very precise outline of the order in which the various types of life have appeared on the earth. It has long been taught that certain low types of life lived in a certain age, say the Cambrian, and that afterward, when these had all died off, certain other higher forms of life appeared, to be in turn succeeded by others still higher in the scale. This would, indeed, be an outline or skeleton of a development series; and it would not be unreasonable to think that somehow or other these forms might have been connected with one another by descent.

But more recently, many facts have been discovered which put these matters in an altogether new light. In many places all over the world, strata containing fossils have been found in a relative order which formerly was thought to be utterly impossible. That is, the fossils have been found in the "wrong" order, and on such a scale that there can be no mistake about it. For when an area 500 miles long and from 20 to 50 miles wide is found with the Paleozoic rocks on top, or composing the mountains, and with Cretaceous beds underneath, or composing the valleys, and running under these mountains all around, as in the case of the Glacier National Park and the southern part of Alberta, the old notion about the exact and invariable order of the fossils has to be given up entirely. It now seems that the value of this whole geological series is about that of the German mark or the Russian ruble. It may be a good classification series, or a serial arrangement of the ancient forms of life; but we can no longer maintain that its different "formations" have any intrinsic *time-value* whatever.

And in view of all this, there does not seem to be anything solid on which to build any broad scheme of organic Evolution.

These latter points are quite new, and not all scientists are agreed as to how they should be understood. But personally I must confess that I have lost all faith in any scheme of Evolution which would seek to derive man from the lower animals, or which would endeavor to derive the various orders or classes of animals from some common original. All this is, in the light of modern developments, too wild a scheme to be dignified with the name of even a scientific theory. It is an unscientific pipe-dream.

Shall World Perish to Protect Speculators?

How U. S. Navy Would Have Handled Problems of Economic Peace

By CLIFFORD ALBION TINKER

WHAT I am advocating is the fulfillment of the promises we made the world when we entered the war, promises abandoned at Paris in a turmoil of self-adulation, petty spite, grandiose dreams, impracticable statesmanship, cheap politics, money lust, and downright ignorance exceeding anything ever chronicled since history emerged from mythology and fable.

I am not thinking of the "Fourteen Points," that toboggan upon which Germany slid under the gibbet of deserved punishment; nor of "making the world safe for democracy," when nine-tenths of the world doesn't know what democracy means and wouldn't know what to do with it if it arrived; nor am I thinking of "open covenants openly arrived at," which met its Waterloo as a practical thought at the hands of the "Big Four"—or was it Three?—at Paris; nor yet am I thinking of that mocking phrase, "self-determination of small peoples," slain at the threshold of the League of Nations; what I am thinking of is the statement made to the world at the time we declared war against the kaiser—that "America wants nothing in return for all this," a statement which the whole world heard and intended to make us live up to, as the records of the Paris Conference attest.

Indeed, that statement was amplified, it was reiterated from all sides, it finally became something like this: "Our dead have mingled their sacred blood with the dews and damps of the poppy and lily fields of France; were those heroes alive today, they would shout as we shout: 'America wants no indemnity, she wants no territory, she wants no glory; this sacrifice is a free offering upon the Altar of Humanity!'" Brave words! But our preferred financial position as the world's munition depot and supply base, maintained for three years, counted too heavily. We had the funds. We became the bankers of the Allied powers and then of the world. Being the lenders, we made the terms; and we have set the worth and value of the nations' goods and money.

More Responsible Than We Realize

BUT in so doing we have flouted our own specified gift to the "safety of the world." What we as a nation, in full-hearted sacrifice, "laid upon the Altar of Humanity" has been filched by our own financiers. The time has arrived to restore that gift, to re-enshrine that sacrifice; for the cry: "Give us Bread!" now heard throughout the length and breadth of Europe, is but the herald of "Bread or Blood!" Our unsold crops are as nothing compared to the vital physical needs of Europe. Europe has the blind-staggers, one stage from seeing red. Money; speculation in exchange margins; unjust rates; these are the spurs to chaos.

Unless the United States Government buys a huge share of the country's wheat crop to ship overseas as a charitable contribution to some famishing land—recent events point to Asia Minor—the season's crop will scarcely pay for the sowing. As for the cotton crop, so vital to the prosperity of the South and Southeast, that must be sold by the producers, if at all, at a price inviting bankruptcy. In the meantime, millions of tons of costly shipping is rotting at our moorings. We have nearly all the gold in the world and a constantly diminishing volume of the world's business.

Our post-war financial operations have consisted, mainly, in speculation in foreign money rather than investment in foreign trade. Believe it or not, we have a much greater responsibility in the financial nightmare of Europe and the stifling of world commerce than we care to admit. Thus we thump our knuckles on a boomerang. Exchange rates manipulated and, in a large measure, controlled by ourselves have raised up an almost insurmountable wall against us. And only by the return of normal exchange rates can we hope to dispose of our surplus crops, put our immense merchant marine back on the Seven Seas, and regain the friendship of the world, now sacrificed to penny-grabbing margins at the exchange counters of international bankers.

At the close of the war we held the preventative whip hand against all this chaos; even now we hold the remedy.

At 11 a. m., November 11, 1918, the zero hour of Peace, a conference was opened at headquarters, in London, to consider and outline proceedings for a "record demobilization" of American Naval Aviation, an outfit comprising nearly one-third of Admiral Sims' total force. The conference was to hear from an officer of great responsibility, one who, in the nerve-racking months of 1918, had been in official contact with the representatives of England, France and Italy having to do with the production and procurement of the supplies and equipment essential to the conduct of the war. This officer knew the problems of demobilization, the system of credits, rates of exchange, the value of the commodities and supplies involved in the undertaking proposed, and he also knew the financial and industrial conditions at home and the conditions and needs of the European nations concerned. His advice, it was expected, would be fraught with wisdom born of experience and exact knowledge.

So it was. And, too, his advice was at variance with the course of action previously outlined by the "powers that be," for he went beyond the duties and functions of the conference, and the needs of the moment, and embraced, not only the demobilization of naval aviation, but the general demobilization of the world's armies and the problems of post-war rehabilitation. An outline of his policy, which was in all respects calculated to bring prompt order out of the general mess and which will still provide a way out of the economic turmoil in Europe, although largely canceled by Allied action and the Versailles Treaty, shows how far the Allies went out of their way to establish conditions leading to present difficulties.

Briefly stated, the Naval Conference program constituted the following: First, the United States and the Allied powers, having already pooled their military, naval, and industrial resources for the prosecution of the war, should maintain that pool until peace is an accomplished fact, and as much longer as found necessary to bring Europe and the world back to normal pursuits, that is, industrial and financial balance.

Secondly, the backbone of international intercourse depending upon finances, the war coalition should be extended to include the stabilization of international exchange rates. For only by such stabilization can the powers gain a position with respect to production and marketing which will forestall economic chaos, sure to follow uncontrolled and speculative international finance.

Thirdly, international shipping also must be pooled for the rapid adjustment of world commerce. Shipping rates and tonnage allocations must be standardized upon a fair and equable valuation of the various merchant marines and the international adjustment of seamen's wages. This will assure the re-establishment of foreign trade between America and the Allies, and the various nations can purchase and exchange with each other, precluding industrial stagnation in any of the lands concerned.

Fourthly, the foregoing agreements having been ratified, the Allies can proceed to make peace with Germany and her supporters. But wholesale demobilization must proceed at a very moderate rate, for the breaking up of Eastern Europe into small buffer states will require a plentiful show of force on the part of the Allies, else the new states will exceed their functions as "buffers" and war will be constant from the Baltic to the Red Sea.

Fifthly, Allied troops must enter Berlin and the Allies must establish their control from that city. Only in Berlin can proper support be rendered the new German government by the victors, and the presence of Allied troops in that capital will be the only guaranty that the peace terms will be speedily met by the Germans, and that the defeated powers will at once proceed to re-establish their industries, essential if the funds for rehabilitation of the devastated fronts are to be assessed upon the Central Powers.

Sixthly, any assessment of damages against the Central Powers must be for damages to lands and property only, and the sums must be arrived at by careful surveys of the damaged territories and a just valuation of the abilities of the several defeated powers to pay. This last valuation will depend upon the allowed participation of the defeated powers in the Allied rehabilitation of international commerce.

The Reparations Obsession and Its Results

THIS line of action was suggested to certain American officials at the Hotel Crillon, but the American contingent had brought to Paris a full staff of advisers, military, naval, political, financial, and what not, hence there was but scant attention paid to such advice. Then, too, Great Britain made every one of the suggestions impossible of accomplishment by her policy of grab, get and grind. This line of action was based upon a promise made by Lloyd George to the Empire.

In the autumn of 1918, the writer, then in London, was astounded to see, right in the middle of the great drive against the Hindenburg Line when British casualties of all classes totaled 30,000 a day, a strike begun by the British coal miners and the metropolitan police and firemen. To assure the production of coal and to quell the strikes without using force, and, by the same token, to assure the re-election of coalition government, Lloyd George began to preach a new sermon; not only must Germany pay damages for the devastated areas, but the cost of the war—pensions, bounties, and other extraordinary war expenditures.

It is true that the United States did not become a party to this reparations obsession, in fact, did everything possible to keep the items of greed out of the sums assessed against Germany, but the British demands found echoes from all sides. France, Belgium, Italy, even such nations as Portugal and Liberia, were promised huge sums, and that is why at this very writing, because of Germany's delay in reparations' payments, the Portuguese are going through revolution after revolution; each new Portuguese government promises speedy collection only to fail and fall—hence the practical ruin of Portuguese trade and finance. And Liberia, promised a $5,000,000 loan by the United States, came into the war; was then allowed to sit at the Conference Table at Paris, granted a reparations slice from Germany, thus to cancel the American loan, found, alas, that Germany can't pay, so Congress is now asked to grant Liberia the promised loan!

Demobilization went on at such a pace that not only has war continued from the Baltic to the Red Sea, carried on by the small and new nations springing up in the wake of "self-determination" and created out of whole cloth by the "Big Four," but those selfsame small states, well knowing that the Allied armies once demobilized, would be almost impossible of resurrection, have done as they pleased; even the kaiser's treacherous brother-in-law was allowed to "come back" and wreck Greece and lose Thrace and Asia Minor to the despicable Turk!

World Cannot Perish to Protect Speculators

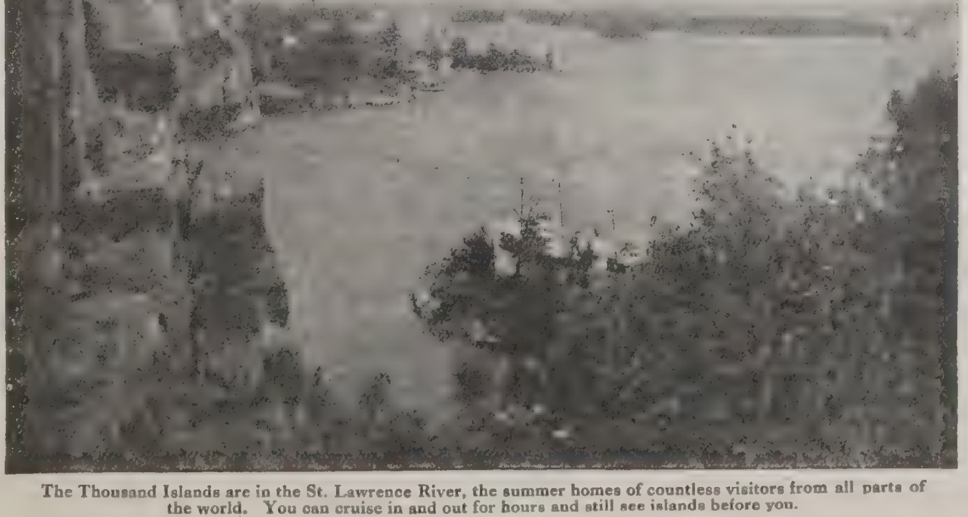
BECAUSE of the enormous demands on Germany, and the lack of an Allied force in Berlin to carry out effectual enforcement measures, Germany, naturally, has deliberately sought bankruptcy, has issued oceans of paper marks, and refuses to do anything but dally and delay. This action on the part of the beaten (?) Fatherland has brought forth the amusing spectacle of itinerant cabinets, *wagons lits* ministries, and strolling commissions flitting from Paris to Cannes, to London, to Geneva, to Genoa, to The Hague, and they are still on the go; but all the time getting deeper and deeper in the slough of misunderstanding, all the time approaching nearer and nearer the rocks of out-and-out discord.

There may be some method of compromising the reparations issue, there may be something good come of the Stinnes-Lubersac agreement, France may relent, Germany may repent, but what the world wants at this critical moment is the rehabilitation of trade, a chance for the poor to obtain food and other necessities of life without being over-taxed even unto the fourth and fifth generations to come. By putting into effect the provisions of the second paragraph of the London Naval Conference program, relief will almost immediately follow. Standardize and stabilize international exchange rates, basing the wealth of nations upon their natural and industrial wealth; be honest about it, and it will not be long before the lands not under a bitter financial depression will be able to balance their budgets and pay their bills, then will come world trade and a return to normal living conditions.

But, anticipated question, what will become of the investors in foreign exchange rates, those who have bought German marks, French and Belgian francs, and other depreciated currency and paper? Well, some will gain, some will lose; probably more will lose than will gain, let them fare as they will, the whole world cannot remain in financial chaos to protect a few speculators. And, after all, when a great plague or epidemic is brought under control or stamped out, no one in the community is heard to complain except the undertakers.

We can bring about the stabilization of world monies, we are in a position to do it. Of course, we must seek co-operation among the nations, but that will be forthcoming, never fear, all nations will grasp an opportunity to co-operate to such ends, even as the proverbial drowning man at a straw. I have put this desirable move on the grounds of national prosperity by means of a revival of commerce between nations, and as a relief to the dire straits of Europe, but I believe we should do it for motives more nearly akin to justice and international morals, more as a duty than a necessity, even, and because this nation stands for what it does, and because our dead would have it so

Your Own United States



The Thousand Islands are in the St. Lawrence River, the summer homes of countless visitors from all parts of the world. You can cruise in and out for hours and still see islands before you.

BRIEFLY TOLD

Modern Turkish girls no longer live secluded lives. They are working in offices, some as bank clerks, some as bookkeepers. Many are studying medicine and electrical engineering and others are going in for agriculture. All are preparing for careers of usefulness. The *charshaf* or veil has been modified to a mere scarf, extremely charming and attractive in its simplicity.

A 13-year-old Ogden, Utah, schoolboy has trained a wild cat to follow him to school each day.

More than $30,000,000,000 are invested in tax-exempt Federal, state and municipal bonds in the United States, according to a prominent political economist. It is estimated the United States Treasury is losing some $300,000,000 a year of income-tax revenue because these bonds are exempt from taxation. This slack must be taken up by those who do not own tax-exempt securities.

Three of every 10 persons living between Fiftieth and Twenty-eighth streets in New York City are drug addicts, according to a prominent physician formerly attached to the state narcotics division.

No more will London be clouded in fog if a new fuel discovered by a mining instructor does all that is claimed for it. The fogs of London are produced from the smoke of factory and grate fires. The inventor of the new fuel has brought forth a new bright, hard coke which ignites easily, produces little dust and burns with a cheerful glow. It is made by carbonization of powdered coking and non-coking coal at a temperature of 600 or 700 degrees centigrade.

Women of Los Angeles have instituted a movement to lift the standard of daily newspapers in Southern California. They urged the elimination of "bannering" in heavy type across first-page stories of tragedy and crime.

Five caterpillar motor cars crossed the Sahara, traversing the 2,000 miles from Tugart, Algiers, on the north coast of Africa, to Timbuctoo, in the Soudan, French West Africa, in 21 days. It requires at least three months for camels to make the same journey. Two machines were equipped with rapid-fire guns to discourage roving bandits. The appearance of the machines was the wonderment of natives who had never seen an automobile before.

Leaving barren pastures and empty water holes, poor prices and high freight rates, great herds of cattle are moving from Texas, New México and Arizona into Mexico. Two thousand old-time cowboys are back on the trail singing the old ballads of 20 years ago.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Fifty years ago North Borneo was inhabited by head-hunters and pirates. Today the descendants of these people are fishermen or farmers, and many have joined the native police force. More than 100 miles of railroad has been constructed and many good highways are in the making.

The number of reigning houses in Europe had declined from 41 in 1914 to 17 in 1922.

The record made 30 years ago by the New York Central Railway Engine 999, in its run between Buffalo and New York, has never since been equaled, 112 miles an hour being attained at one stretch.

Perfumes, which still retained their scent after more than 3,000 years, were found in four alabaster vases in the tomb of King Tutankhamen in Egypt.

The gannet, a bird living on fish in Northern Scotland, is frequently caught by means of herrings tied to flat boards. The fisher bird sees the fish but does not notice the board. Diving from a great height it strikes its head against the plank, killing itself instantly.

Forty "huskies" or wolf dogs passed through Edmonton recently on their way to Banff, Alberta, where they will be used by an American motion picture producing company in the filming of a number of northern pictures.

The turken, a cross between a turkey and a chicken, is a new development in the poultry industry. For four years this hybrid has been propagated by a California breeder. The male bird has a gobbler neck and resembles a turkey. The female has a turkey head, but otherwise looks like a chicken. When full grown they weigh from 10 to 14 pounds. The eggs weigh 26 ounces to the dozen, and hatch in 21 days.

Many counties in our western states are larger than entire states along the Atlantic seaboard.

An explorer sent out to obtain specimens, relics, and other fragments of a lost civilization, on the Island of Rapa, in the South Seas, found that offers of money had no effect upon the natives when they were requested to obtain the desired articles. However, when candy was offered in exchange the specimens were forthcoming instantly. When the candy was exhausted business lagged until the wife of the explorer made jam out of the oranges which grew in abundance on the island and which the natives considered more valuable than the candy.

Certain novels of Mrs. Gene Stratton-Porter are to be filmed. For years she has resisted the temptations of fabulous offers for the screen rights to her popular stories, fearing that they would be garbled and suggestive incidents added to give the thrill that producers talk about. Mrs. Porter's stories are interesting and popular and free of anything objectionable.

For the first time in the history of Pennsylvania a woman was named a member of the governor's cabinet. The position is Commissioner of Public Welfare.

The Sahara Desert embraces more than 3,500,000 square miles, being nearly as large as the European mainland. This desert is famous for its extensive trade in musk, gum, dates, alum, hides, spices, cotton, palm oil and ostrich feathers. It supports a population of 2,000,000.

The millionaire son of the inventor of the rickshaw is converting his great factory into a manufactory of baby carriages, as he realizes that this convenient and picturesque vehicle of the East is on the road to extinction. The decline of the rickshaw in Japan is due to the fact that labor, even in the Orient, is rising above the vehicle-pulling stage.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

CHRONICLER OF THE NEGLECTED TRUTH

Fascism as a New Cure for Demagogy

"Autocracy of Statesmanship" Makes Mussolini's Government Possible

By A. R. PINCI

WITH hybrid political partisans growing like mushrooms it was impossible for the downtrodden proletariat to choose, so in 50 years or so there never was a government in Italy that could truthfully say it was popularly representative. The Mussolini government is the first—and this in spite of its putting into effect, or announcing that it will effect as soon as practicable, those reforms which are good for the nation but which step on the sore toe of the great unwashed; as, in this case, deciding to extend the income tax to the laboring classes, to curtail the wine traffic, repealing unjust rent laws. Conversely, Premier Mussolini has threatened a censorship over the press and swift action against parliamentarian demagogues, the former because its propaganda is injurious to the nation and the latter because it endeavors to "fish in dirty waters."

As an example, after a lethargic spell the Maximalists gave signs of an obstructionism which should begin in the field of foreign affairs. Premier Mussolini hastened with a warning that he would not tolerate violence on the part of minorities whose only purpose is to interfere with and embarrass the government.

> "If in Russia," he explained, "the so-called common people should assume an attitude against the Bolshevist authorities like that which the Maximalists believe to assume in Italy their destiny would be decided bloodily. The latter will, therefore, compel a most rigorous policy on the part of the government to prevent the irritating of an industrious people."

What Made Fascism Possible

BUT because the attitude is so unyielding against others it should not be assumed that the Fascist leader is any more kindly toward his own creatures.

The precise difference between democracy and demagogy is one of lip-work. So much has been said during the past few years about or for the sake of democracy that unconsciously we have become demagogues.

The war has not vanquished militarism, of course, except in places, but one thing is obvious to any observer; *that the war has established an autocracy of statesmanship which has been more destructive, in the few years it has been in power, than any and all armies.*

The new fashion among the new crop of demagogue statesmen, as they are beginning to confront the harm they have wrought, is that the world is in decadence. Books have been written about it and speeches are being made. It is the usual self-made coat of whitewash.

The trouble is that no country, as such, is decaying. But the trouble is, and has been, that statesmanship has been decaying.

This is the sort of statesmanship which has made Fascism possible.

Fascism is not to be considered merely in its modern Italian aspect. The word—as explained in a previous article in these columns—more than a score of centuries old, is Latin, and as this language has been the root of thousands of English words, etymologically "Fascism" should become a good English idiom. This transition is all the more logical, in an American sense, because the *Fasces* are the oldest extant symbol of democracy known; a matter not to be lightly overlooked when our politicians ballyhoo that democracy was born in the United States. If democracy has an older genealogy than the Latin, these antecedents are obscure.

History is not clear if the Fasces originated under Romulus or one of the Tarquinii, but from the day of either to Mussolini is a long step, chronologically more than politically. Under the Publilian law, 339 B. C., Rome granted equal political rights with plebeians and patricians, and this principle, after many repudiations, could not be definitely and forever overthrown. But while modern political development *could not admit of a governing patrician class,* it has given us, the world over, *a governing political class.*

Fascism is aimed against this class.

World May Be Grateful

FOR the time being it is Italian, but in the normal aspects of the problem its application is world-wide. If Fascism is victorious the whole world will have reason to be thankful.

Fascism has had, needless to state, some comical attributes, and that perhaps is its chief merit. The temptation has been great to give the benefit of the limelight to Mussolini, whom a romantic press would have as the wielder of the Fasces with an extra-sized ax as a decade ago our own Theodore Roosevelt was always leaning on or swinging the big-stick. Mussolini is an important personage, but Fascism could not *be* except for the backing of that youthful Italy which was bent upon house cleaning and modernization. Mussolini is not performing his work by sitting behind an artistic desk in an historic palace and pushing electric buttons that golden-braided lackeys answer; *what he achieves is due to the hundreds and thousands of men like him who have decided that political parasitism must go.*

To be exact, Fascism as such does not any longer exist, except as a political label. It does not claim that it can do everything by itself. It is a power under a greater power. It is the voice of a real majority of the people spoken through those who first learned how to translate it.

Fascism's first act was the oath of allegiance to the constitutional government in the name of the king, the monarchy being "the fundamental element for the maintenance of national unity." The most imposing demonstration was made on New Year's Day, when Fascists and mere common people who believed in the cause together acclaimed the king at the Quirinal—an act of homage that was acknowledged by the sovereign when he appeared on the balcony of the royal palace. *It is said that this was the first time in ten years that King Victor Emmanuel smiled.*

The event just stated has a double significance, especially for the benefit of foreign skeptics, who believed that King Victor Emmanuel swallowed the Mussolini régime because he could not help it, rumor having it that it was either Fascism or abdication. That is erroneous. The monarch's elimination was never upon the program of Fascism, although it has always been the *cheval de frise* of both Socialists and Communists. As Fascism was aimed at these two revolutionary and undemocratic elements its sponsors could not subscribe to the anti-monarchy principle without becoming enemies of the state.

Public acknowledgment of tribute on the part of Fascists and the people has been sufficient, however, to make a Fascist of the king. The king, moreover, has gone further. He has lauded his ministers, who, in ten weeks, demonstrated an unusual capacity for work, this capacity calling for the sovereign's signature in more decrees than he expected in one year.

It would be untrue to speak of the Italian Government today as a "Fascist government." Fascism has not curtailed the freedom of political thought; men who are not Fascists are ministers or hold other high public office. Fascism's aim has been *to select the most capable men* irrespective of their political opinions. The only condition is that their record must be exemplary in a civil sense, and the rigorous application of this rule is especially beneficent when one studies its effects in political substrata. Fascism wants to insure for itself a model democracy in ward politics, for instance, as in the higher circles which are under the world's scrutiny. It may be added that Fascistic inquisition revealed in an important Cicilian city a list of *"30,000 electors who do not exist." Elimination of false suffrage lists on this or any other ratio throughout Italy will make it impossible for a Socialist-Communist ministry like Nitti's to come back.*

The king's frank allegiance to and support of the new government is not all, however. More significant is the unmistakable sympathy on the part of Pope Pius XI, and New Year's Day was notable in that the priests of parishes throughout the kingdom were exhorted by their superiors—and in turn have exhorted their followers—to pray that "God shall assure success to the Mussolini government." That is a spiritual victory that no one had foreseen.

"Must Serve, Not Use"

STATESMANSHIP, in its anonymous sense, is not religious at all. In the United States, for instance, the legislative day begins with prayer and the executive proclamations make reference to God. In Italy since the passing of the temporal power in 1870 the references to God have been few and far between, so that the first official address by Premier Mussolini before the chamber of deputies, with its invocations to God, was commented upon as puritanical and Cromwellian.

"Fascism must serve the state and not use the state," he declared, which effectively stopped short the agitation on the part of many of his former followers that "having saved the state" it was now time to save themselves. That is blunt talk for a new political party; no plums, no government jobs, no recognition of preferential kind. At last accounts patronage has not appeared; so far as Rome knows, there have been no desertions in the Fascist ranks. Just for the sake of mental recreation, it would be interesting to speculate upon what would happen if a major political party of the United States were to say the same thing! The *hoi polloi* would like it, but how many politicians would lose their color the same day?

Fascism's decline would set it the very instant that politics substituted service for the state. This is the one doubt that remains about the permanence of the new Italian statesmanship. Mussolini, through sheer force of his personality, and perhaps his successor, whoever that may be, will keep Fascism what it is, a frank and unadorned statesmanship with no pickpocketing in the national treasury, but what after that?

It goes without saying that as a government Fascism may inaugurate or sponsor laws and policies which either the Italian people or the peoples abroad may not approve of or like. As it consists chiefly of the human equation it is inevitably fallible. On the other hand, taken as a symbol of new statesmanship, it is worth examining carefully, pondering in detail, checking up impartially. For the underlying moral, after all, is not whether Fascism as such will or will not fail, but whether it will endure. If it does it means that the people's sovereignty has never been sacrificed and hypothecated to whatever governments have existed or will exist. *The people lend their authority—but they can recall it,* and Fascism is an instance of such a recall such as to leave no room for doubt.

In the United States Fascism is not applicable in exactly these proportions because the Constitution has wisely provided for a regular change every four years, but a Fascistic "recall" of all politicians who have preempted certain places of importance would not be amiss, as any one knows who is conversant with the inner and not always publicly known workings of politicians. The great evil in Italy—as well as in other countries governed by ministries—has been that within a few years they establish a certain closed circle of their own. Each ministry that falls is replaced by another recreated in part from the ruins of the old; frequently in personnel, always by other bonds. This is an oligarchy that is worse than imperial autocracy, because ministries fall when peril—sometimes personal—is near, but the dynastic autocrats must live out their tenure unless kicked out.

Fascism came at a time to save Italy from further footballing on the part of three or four politicians who at different times held the premiership and kicked it about among—and always within—themselves. The ex-premier who has been speaking of the decadence of Europe is absolutely silent about his own decaying statesmanship—about which many volumes could be written. Like Mr. Lloyd George who is blaming the Bonar Law government for "what's wrong with England," Signor Nitti has gone a step further and taken the whole Continent for his observation, but he does not mention the fact—as did not his British colleague—that what's wrong with England and Italy is their own respective handiwork. These two premiers are mentioned by way of example; they have a notorious company of other nationalities.

Its Hymn Is "Youth"

FASCISM is not a private policy or the pet scheme of Benito Mussolini and a few of his adherents. It is a reversion of power to the people. It is the wish of its banner-carrier that Fascism can be served by youth alone, and for that reason its national hymn is entitled "Youth." But by youth is not meant smart aleck 'teens or intolerant twenties, but rather that mental vigor and imaginativeness which cannot be measured within the span of years. If anything, youth in a Fascistic sense is intended as being that age up to the moment when the courage of common sense relapses into senile or semi-senile consistorialism. The writer has been told that the first rule Signor Mussolini set for himself was that of not preaching, of not being evangelistic, on the assumption that this is a field which is the church's—any church's—province, and that if the worst came about he would warn—not preach—and act afterward.

Roughly, in less than three months the Fascist government has decreed, ordered or planned for immediate execution these things:

Law and order, without distinctions or preferences, including Communistic sniping and Fascist retribution, with a view of eliminating, above all, the more or less regular lawlessness whch grows out of Saturday-afternoon-to-Monday-morning idleness;

Demobilization of every armed private or semi-private organization, whether the Fascist black-shirts or the nationalist blue-shirts or the Communist red-shirts; and the formation of a new national militia. Contrary to report, the new body is not a new defense for the use of the Fascist government, but it is under the state and for the exclusive use of the national defense. "Without arms," Premier Mussolini has said, "it is more significant, more solemn, more noble";

Reorganization of the army proper, with a service limit of 18 months with more liberal exemptions under a sounder interpretation of economic exigencies in each individual case;

The elimination of cell-imprisonment in the daytime, and the substitution of agricultural colonies instead of cell colonies, to prevent cruelty and suffering by lack of sunlight and fresh air, and the opportunity to leave the prison penitent and not crazed;

The modification of certain statutes and the simplification of legal systems, which are expensive, time-consuming and often injurious to either party or the state (the Italian code is much simpler than the American);

Cutting Down Bureaucracy

THE abolition of all duplicate bureaus and offices in or under the government; the dismissal of nearly all semi-executive or administrative bureaus; the discharge of about 50,000 railroad workers by the efficient rearrangement of schedules and motive power; the elimination of all free railway passes to government employes and perhaps to legislative officials, too; the elimination of countless military bands, retaining only the two famous ones of the Carbineers and Grenadiers, and one band for each army corps; reduction of special personnel abroad and substituting Italian citizens for foreigners wherever possible;

The simplification of "electoral proportions," upon a basis of real representation, with a view of preventing fractional minorities from uniting against the interest and welfare of the state;

The decision not to legalize games of chance because inconsistent with national dignity and because undesirable that municipalities should pay their way on returns from gambling ventures, and, in addition, to stamp out the gambling evil;

The revision of every appointment made after May 24, 1915—Italy's entrance into the World War—and dismissal of everybody except ex-soldiers decorated for valor, and widows and sisters of soldiers, provided they have demonstrated their ability;

The revision of taxation laws, which have hit the middle or white-collared classes, exempting the speculators and the organized laboring classes, and immediate provision to tax every wage earner or income receiver upon an equitable basis, with mandatory punishment in case of fraud;

Special appropriations of 9,500,000,000 lire for national reconstruction, to provide work of useful kind

(Concluded on page 13)

Repeal a Thousand Laws and Help Progress

Instead of Making New Laws, Wipe Out Old Laws: Laws Create Jobs Without Improving Conditions

By HON. A. OWSLEY STANLEY

A. OWSLEY STANLEY has been active in state and national politics for more than a quarter of a century. He was elected to the United States House of Representatives in 1902, serving in the Fifty-eighth, Fifty-ninth, Sixtieth, Sixty-first, Sixty-second and Sixty-third Congresses before being elected governor of Kentucky in 1915. After serving as governor nearly four years he was elected to the United States Senate, of which he has been a member since May, 1919. He was a member of the Pujo committee which made an extended investigation of the Money Trust several years ago.

HON. A. OWSLEY STANLEY

United States Senator from Kentucky.

THE time is approaching, if it isn't at hand, when there must be a changed attitude, both on the part of the public and its spokesmen, with regard to what we call legislation. The best, perhaps, that any of us of the present day can hope for is a decrease and possibly a stoppage of the excessive lawmaking which is probably the chief political characteristic of our time.

Sooner or later, however, we must go further; the best effort, the best thought, for a considerable period of time, must be devoted chiefly to *the repealing rather than to the creating of statutes.*

"For 500 years all advance in legislation has been made by repealing laws."

Thus only 75 years ago wrote one of the four or five greatest political and social philosophers that ever lived.

Henry Thomas Buckle wrote that sentence as a protest and a warning against the then newly developing tendency toward legislation as the universal cure-all.

If the repealing of statutes more than their enactment marks true legislative progress, as it seemed in 1858 to the author of the classical "History of Civilization in England," how have we fared during the last half century.

One glance into any comprehensive law library will give the answer.

Oh, How the Laws Pile Up!

WHILE the fever for new and more law seems to have dominated the legislative thought of all the world, in no country has it raged with such violence as in America. I do not except even the Germany of Bismarck and the last two Wilhelms—a Germany that veritably was "made over" by the statutory process within a period of a generation. In one of the ex-kaiser's recently written documents the boast is made that under his régime nothing was considered to be beyond the power of the state. The calculated purpose was to merge all interests, even those of the individual, under a Federal supervision. The most efficient blending and molding and wielding of mass power the world has ever seen was the outcome. But it carried within itself the seeds of certain destruction. This massing of everything into the state created a political Frankenstein monster, which no group of individuals could control. And when war came the mass broke before the determined individualism of other nations. The German organization had lost facility for acting as man and man; they were forceful only when moving in massed bodies.

Our fever for lawmaking, while productive of a greater number of laws even than in Germany, has been less effective in our case, for the reason that we have been less thorough. The Germans went about it scientifically with their object very clearly in view. With us it has been largely a matter of following the lines of least resistance. If a difficult problem arose, we passed a law and then quite often forgot both the problem and the law. But we left the law in the statute books and, as not infrequently occurs, when it aggravated the very evils against which it was enacted—we passed another law.

Thus an incidental glance at this heterogeneous mass of Federal legislation will convince you that if legislative progress depends in any way on the converse of lawmaking we have been retrograding atrociously—and still are going downward.

Place any current state code beside its predecessor of 1860. You will find that it is from three to ten times as voluminous. Put the recorded acts of any recent state legislature beside those of a predecessor of 10, 20 or 30 years ago and you will find the newer output to cover several times as much space as the older one. Do the same with the published acts of Congress and the same fact will be disclosed.

It naturally follows that court decisions and opinions, which in many ways themselves are statutes, likewise multiply at a steadily growing rate.

And there is no sign of a let-up. Lawmaking bodies, by simplifying procedure and delegating powers, increase greatly their *per diem* output of new law. The boast is the number of laws enacted, not of the wise legislation passed or the unwise proposals defeated. The majority floor leader in the United States House of Representatives thus summed up the work of the Sixty-seventh Congress during a little more than one-half of its life:

> **"This Congress has, up to this time, placed upon the statute books 398 laws of which 311 are public and 87 are private, including claims. This is at the rate of 1 1/3 laws per legislative day for the entire session."**

Think of it! For every three days of Congressional activity—now almost continuous throughout the year—the country having to adjust itself to four new Federal laws.

That isn't the worst of it. Whenever a Congress or other legislative body adjourns *sine die,* it leaves *a much larger amount of unfinished work than it inherited.*

Something like 20,000 different bills were introduced in the Sixty-seventh Congress alone. Many of them no doubt were introduced with no hope, perhaps no immediate desire on the part of those who framed them, that they would be enacted into law. But legislative history of the last 25 years demonstrates nothing else so clearly as the fact that persistence will in time turn virtually any demand of an organized minority into a solemn act of law. This truth applies even to proposed amendments to the fundamental law. It has come to the point where anyone who wants to add to constitutional or statutory law has only to keep on demanding it long enough. Ultimately it will be adopted, if for no other reason than to get rid of its sponsors.

In this fever for lawmaking, this hectic belief in the all-powerful nature of a sheet of paper called a statute, there lie many dangers—some that may be threatening to civilization itself.

The least of them, perhaps, are the most apparent, the undue exalting of government, and exorbitant growth in the cost of its operations; the depreciation of the individual and the appreciation of mere mass; the heightened potency of property over the human being; and, worst of all, insidious inroads on human liberty.

It is not demonstrated majorities which come forward demanding these "398 separate laws" from a Congress in less than four-fifths that number of days. In 99 out of 100 cases only "minorities" demand them. The majority of people are too busy with other things to be demanding such a flood of legislation, even if they wanted it, which they don't.

We need have no fear of true majorities, though our scheme of government is built upon the truth demonstrated by history that they can be unfair, unjust and, when functioning hastily, dangerous. That is why our Constitution is interlaced with "checks and balances" aimed principally at restraining the possible tyranny of mere numbers, as well as the individual tyranny which inevitably results from it.

What we need to fear most in these days of quick communication and highly efficient methods of organization and propaganda are minorities that are powerful because of concentration of effort or means.

Meddling Minorities Responsible

IT IS busy, meddling, pernicious minorities which account for this rampage of needless lawmaking.

Separately, most of these minorities themselves will agree that, on the whole, the tendency is pregnant with threat and danger. But each operates under the thin delusion that the granting of its particular demand will of itself alone be of no great importance in the totality of evil involved in all. Usually it is right; frequently the demand considered alone is of great appeal. But to grant one paves the way toward granting the others. It is the sum total that counts.

In 1907, Senator Foraker, of Ohio, bemoaned the multiplication of useless offices and officers in his degenerate day, declaring that:

> "The little band of 167 special deputies, agents and inspectors on the pay rolls of the government in 10 years has been swelled to an army of more than 3,000."

Only 3,000 prying agents and inspectors operating under Federal Government commission in 1907! **There are more than 30,000 now.**

Indeed, others of reliability estimate the present number in much higher figures. Former Governor Haskell, of Oklahoma, declared only a few months ago:

> "Less than a quarter of a century ago, in the great employment of individual rights and local self-government, our Federal authorities found it necessary to have upon the pay roll of the Federal Government fewer than 200 sleuths and special agents and inspectors to aid in the enforcement of Federal laws. Will anyone defend the policy of the Federal Government which today *employs 42,000 inspectors,* sleuths and inquisitorial agents to dog the footsteps of him who should be, in the exercise of his constitutional rights, enjoying the hitherto dignity and freedom of an honest American citizen?"

Look back and see what Thomas Jefferson was able to say in his second inaugural address:

> "At home, fellow citizens, you best know whether we have done well or ill. The suppression of unnecessary offices or useless establishments and expenses enables us to discontinue our internal taxes. These, covering our land with officers and opening our doors to their intrusions, had already begun that process of domiciliary vexation which, once entered upon, is scarcely to be restrained, reaching successfully every article of produce and property . . . .It may be the pleasure and pride of an American to ask what farmer, what mechanic, what laborer ever sees a tax-gatherer in the United States?"

From the beginning of Jefferson's to the end of Buchanan's administrations—60 years—the Federal Government's operations, including two wars, cost less than a billion dollars.

What Washington Is Doing

DURING the last 10 years of our time the appalling cost of a hundred different commissions, boards and bureaus, employing an innumerable army of deputies, inspectors, supervisors, spies and political parasites, has actually exceeded by 400 per cent the total cost of the Federal Government for the first half of its existence!

For the fiscal year ending June 30, 1922, the amount appropriated for governmental purposes (outside of the cost of the Army and Navy departments, pensions and the Veterans' Bureau or reduction of the national debt) was $1,115,517,366, *an increase of 500 per cent since as recent a year as 1916. It was within a few hundred dollars of the total cost of the government between the inauguration of George Washington as President and the birth of the Republican party.*

There seems to be no limit on Federal power and no bottom to the Federal Treasury. Acting upon *the preposterous assumption that national wealth can be multiplied by Federal taxation,* Washington has become the mecca of the visionary and the necessitous, each hour furnishing some new legislative nostrum or some new means of harassing or plundering an outraged public. All they need do is to stay long enough and be persistent to get whatever they demand. How can it be otherwise when legislative leadership, as I have shown, glories not in the character but in the amazing *volume of grist turned out by the legislative mill?*

You need but glance through the headings of the probably 20,000 bills still pending at this writing in the Sixty-seventh Congress—most of them not passed will be introduced again with many more in the next Congress—to see that this inordinate lust for inquisitorial power, for governmental favor, for the use of the machinery of governments to plunder interests, sections, classes for the benefit of others, has only begun.

There is not at this hour left a single "inestimable privilege" or one "inalienable right" mentioned in the Declaration of Independence and secured by the Constitution which is not openly invaded or secretly undermined by some paternalistic project or subversive propaganda.

Will Rogers—National Spokesman

THE last place the American people would have looked for wisdom, for preaching and for the wash of wholesome laughter that cleans away the stains, would have been the stage or the movies; and least than the last place to look would have been a homely cowboy actor. But Will Rogers has come, and with him a new breath of life into effete things.

Will Rogers is more than a humorist—as any real humorist must be. He is a natively straight thinker. He has the instincts of the plain people and if he does not let success turn his head, if he remembers that truthfulness wears longer than mere agreeableness, he may even become the voice of the plain people. He has already shown that he has the ability to discover truth and the courage to utter it. Just now he is the popular after-dinner speaker of the upper class, the bankers, and so forth. He does not withhold his tongue from jabbing home a truth now and again, which in a more sober address would be resented. Will Rogers could riddle the monetary structure with laughter, if he knew what a grotesquely funny thing it is, and perhaps laughter will be the weapon of the gods of progress in this matter. When Will Rogers is confronted by a shady business man whose achievements are stock issues and little else, he has a way of letting the audience in on the littleness of that sort of thing and the dangers of it, too. And because it is Will Rogers, the pilloried one plays his part and forces a smile, because it is all supposed to be funny. If Will Rogers keeps his head, and plays away from the ruling crowd in this country (for the ruling crowd was never so wrong as it is now) he will cease to be a professional figure and become a public servant.

That, however, was not the thought with which this editorial was undertaken. It was inspired by Rogers' tribute to Wallace Reid. He tells how Wallie befriended him, an unknown beginner, and how Wallie used to attend all the charity benefits in little out-of-the-way places—"now, mind you, lots of these affairs were away at little towns where it took up your whole evening, so he couldn't have been so wild for Parties always."

Then Rogers goes on: "Now he falls into bad company through being a good fellow. He sinned. He has paid the highest penalty you can pay. He gave his life. He has left a Mother, Wife and Children—one of them an adopted child. Now a bad fellow don't adopt Children. He don't even want Children.

"Now don't let any living Soul say a word about Wallie Reid. He was just a big overgrown Kid who never knowingly harmed a living soul. So let God judge him, not us. I'll bet he will be judged to be away above the average."

A better send-off no man could have. Millions will take Will Rogers' estimate of Wallie Reid as the true one. But—the rugged, native power and righteousness of Will Rogers' mind—that is the fact that compels consideration here.

Price of Gold

THE Seattle *Times* bases a column editorial in advocacy of increasing the statutory price of gold on the following faulty premise:

> "Gold is standardized by the government. At the mint, which buys and sells the metal, the price remains constant, $20.67 a troy ounce."

This is misleading. The government fixes the price in a way, but it neither buys nor sells gold. So far as price is concerned, the word cannot be understood in the ordinary sense. The owner of bullion assayed as pure gold may deposit it and take away gold coin at the fixed rate; or he may deposit coins, if not too much worn, and withdraw a proportionate weight of bullion. Neither transaction is buying nor selling, since for every ounce of bullion in the government's possession, and for every gold dollar it holds, a paper certificate is held by the real owner of the metal.

While the fault in the premise is fatal to the entire argument, the theory advanced by the *Times* in itself is fallacious. Basing its argument on an estimate of the average cost of producing gold as furnished by the American Mining Congress, it advocates the increase in the statutory price of gold. That average cost is put at $36 an ounce. For convenience let even figures be used, as the principle can thus be more simply illustrated. Say we use $20 as the present ounce price and $40 as the proposed price.

The unit of value in United States coinage is a certain number of grains of gold which compose a dollar. In theory all money valid in the country is in gold dollars or in paper money representing gold dollars. Of these dollars, an ounce of gold will make 20 now. Under the proposal of the *Times* it would make 40. That is, the unit of value would contain but half the present amount of gold.

The relation of gold to other forms of wealth, to labor, production, to real estate, would not change. The decrease in the amount of gold in the dollar would find other commodities, other physical forms of wealth, expressed in an increased number of dollars. Cost of mining would double and the same difficulty would be repeated.

There is another difficulty in the way of such a change. The only real reason for the use of gold as money is its adaptability as a basis for international exchange. The gold coinage of the civilized world corresponds to the statute price of gold in this country. It might not affect future business, once the dollar had taken its place at half its present worth in sterling or other metal money, but it would occasion trouble in the satisfaction of past contracts. It is in prospect of such changes, no doubt, that money-wise usurers make their contracts payable "in United States gold coin of the present standard weight and fineness."

It is folly to try to bolster up an industry that does not pay. The masters in control of gold as well as other classes of mining are in the same class with those who have destroyed agriculture by manipulating the money and credit of the country.

Printing Press Money

TO THE man who declares that government cannot make money, the information conveyed in press dispatches of December 11, that the Treasury Department had substituted power presses for hand machinery, will be a revelation.

The volume of currency printing in the department is such that it announces a prospective annual saving of more than a million dollars.

Of course the mere printing of paper does not "make" money. It is the congressional edict as to what shall be a legal tender for public dues. The currency in use, and which this power machinery is destined to print, is worthless without the government's endorsement.

And here is made pertinent the question as to why the government should base its endorsement and validate bank issues of currency on commercial paper and then borrow the "money" it has endorsed!—when its own bonds could be validated to the same extent, or made the basis of bank issues, with the saving of interest on the amount in circulation.

A Ruhr Back?

FRANCE'S saber-rattling occupation of the Ruhr has not accomplished much toward obtaining reparations. It is to be questioned that France expected the seizure of Germany's coal mines would aid in obtaining coal. Since the days of the Armistice, sentiment in the United States has veered so completely that it views European actions with a justifiable suspiciousness, amazingly and completely different from the maudlin sentiment that characterized our affections for our brothers-in-arms in 1917 and 1918. Even at that, it is possible to wonder mildly whether Senator Borah, in denouncing the taking of the Ruhr as "oppression," didn't twist his tongue into one cheek in recalling the American occupation of Hayti.

Young Men and Party

ON THIS page last week a "Citizenship Creed" was printed which was well enough in its way. In tone and principle it was wholly good, but in detail in reminded one of ideals of 25 years ago. It would be good for young men considering that creed to do so with page five of the December 9 issue of THE DEARBORN INDEPENDENT in hand.

Article Four of the Creed reads: "To connect myself with the political party which most nearly represents my views on public questions, and to exert my influence within the party to bring about the nomination of good men for office and the endorsement of measures for the public weal."

That is fine, assuming that parties are what they were probably represented as being to the students who formulated this Creed. Into the party councils of today no young man could honestly push his way, and if haply an honest young man did push his way that far, and kept his honesty, his arrival would wreck the organization he should thus enter. No man in practical politics today, if he have an unspoiled moral sense or any high sense of service, could see a young man enter present-day politics (or so-called politics) without misgiving.

The very essence of modern partisanship, centering as it does in *loyalty to party* and not in *party's loyalty to principle,* is destructive of public spirit.

It is not kind to advise young men to attach themselves to any institution that has forfeited the confidence of the people and survives by trickery alone. It is much kinder to teach them that, if the party system be inevitable, the present parties are not inevitable, not even necessary, perhaps not much longer tolerable. Teach young men that they are the makers and masters of parties, and not merely hereditary members thereof. Hope for the Republic would sink most low if educated young men were to submit themselves to present partisanship or present party leadership.

The first part of Article Four is impossible for educated young men to fulfill, because there is now no party which can even "nearly" represent honest, enlightened and progressive views on public questions. There is no party that America's young men can join.

The Passing of the Bells

PRACTICALLY every youth passes through the stage of collecting—stamps, coins, autographs, if he be esthetic; fishhooks, tops and marbles, if he be but human. It is an instinct of youth, and it may be indicative of our youth as a nation that many of the finest collections in the world are found in America.

A curious and unique American collection is a garden of bells, attractively arranged at Glenwood Mission Inn, California. Mr. Frank A. Miller, its collector, became protector of the bells when his daughter gave him, as a Christmas present, in 1905, a curious bell with the Medici coat of arms. Historical objects had a fascination for Mr. Miller, and this bell appealed to his imagination and opened to him the large possibilities in old bells of various ages and countries and peoples.

His quest led him to all parts of the world. Bells are very often remelted, and it was in visits to foundries that he discovered and rescued from oblivion many of his most interesting and valuable bells.

To the poet the bell has always had a distinct fascination. Too often taken for granted, the bell has long played an important role in the life of civilization. Poe has perhaps expressed most realistically the place various bells have in our lives, and how much more was this true in the lives of our forefathers, when bells were used far more than now.

Sleigh bells—who hears them now? The little tinkling bell over shop doors. Church bells—they grow more and more silent with the years. The milkman's bell. The little bell that stood on the teacher's desk. Cowbells. Bells on the horses that pulled the street cars.

A change has come over our way of living, and this change, to a great extent, has marked the passing of the bell. In its place, we have numerous and divers whistles and electric bells. So the old bell, with its beauty or eccentricity of form, its careful workmanship and interesting inscription, and its variety of tone, is being relegated to the scrap heap of civilization. It is, therefore, with pride that we learn that America boasts, in the Glenwood Mission Inn, the largest collection of bells in the world.

Mr. Ford's Page

AS ONE examines the increasing talk about Europe, one makes out this: the American is regarded as blameworthy because he does not seem to understand that Europe is in a bad way. We have not become fussy, excited or hysterical: any one of these degrees of disturbance would, it seems, have satisfied foreign observers that we were really awake to the situation. It is our calmness, our balance, our national poise that is exasperating; Europe interprets it as ignorance or, what is worse, indifference.

Well, suppose that it were made clear to the critics that we do know, that we do realize Europe's condition, what then? Assume that we know as well as Europe, maybe better, just what the situation is: that we have satisfied the anxious mind on that point: what about it?

The answer seems to be that if only America could understand, if only America could realize, then America would do something! America would "do something."

That's it. Perhaps nothing more forcefully shows the degradation to which Europe has fallen; she is conscious of no help in herself, she is hopeless of ever being helped until America helps her.

THOSE who best know Europe are the Europeans among us. They do not join the propaganda that the United States step in and stop the removal of the decayed systems of Europe. They are hoping, instead, that the ax will go to the very root of the wrong, that the sickles will reap until the last foul weed of oppression has been cut down. Those cry, "Stop this thing," whose privileges are imperilled. But the people of Europe who are in America know—perhaps better than the people of Europe themselves know—that nothing is in peril but the thing that has imperilled Europe for a century. They do not want it to be saved. Propagandists do want it to be saved. That is the difference.

There are several points to be cleared up, that really should be cleared up if another misunderstanding is to be prevented and the cup of the world's bitterness not needlessly increased. One point is this: A great deal of Europe is at present in the United States, and if there is general apathy here, as charged, it speaks ill for European sympathy. Every section of the old country is represented here, some sections very powerfully represented here, all sections are represented to such an extent that most of our politicians and editors are taking orders from the foreign bloc.

If anywhere on the globe the sorrows of Europe should rouse an answering echo, it should be among the tens of millions of Europeans now here. One alien nationality was powerful enough to affect the whole course of the United States Government between 1914-1917. Here we have a score of nationalities, every one of them having ties which reach back to a European country—and yet Europe tells us there is no sympathetic response among us to Europe's woes!

This is a significant fact. What element in the situation accounts for this lack of response among those who should be most responsive? You don't hear any organizations of Europeans in America shouting for reparations, remissions, loans or anything else. You don't hear them propagandizing the United States to do this or that. Europeans in the United States have been very significantly out of these programs. Why?

What we hear most in America is the cry of bankrupt political leadership which wants us to save its status. What we hear is the cry of bankrupt financial trickery which wants us to give it a new lease of life. What we hear, in brief, is the cry of the "masters, lords and rulers in all lands," as Edwin Markham calls them, who have been judged and found wanting—they cry for a fictitious continuance of their power.

The people of America scarcely hear what the people of Europe say, scarcely know what they think. What we hear is what the governments of Europe say—and the fact is that what the governments of Europe say does not any longer matter. What we hear is what the financiers of Europe say, and that does not any longer matter either. Yet they comprise all the news of the world on the European question—as if the people of Europe did not matter!

You can judge what the people of Europe think by observing what the Europeans in America think, and they do not think in terms of the current propaganda at all.

The instincts of the people are wiser than the wisdom of the governments, and by instinct the people simply do not care that the old Europe should be saved. By instinct the American people feel the same way.

Think for a moment of this big fact which is marked deep on the whole European situation: the people of Europe, the people themselves, the real people, are not lifting a hand to prevent the passage of the things which the propagandists are madly calling upon us to save.

For all that one can judge, the people of Europe are content to let politicians, financiers, time-serving ecclesiastics and militarists all go down in one heap, without lifting a hand to save them; because, in such a collapse they see the disappearance of all the organized systems of evil which brought them to their present position.

The cry that we hear is the cry of doomed systems, pleading for us to grant them an artificial extension of life. The people of Europe are not asking us to sustain those systems.

Those systems are doomed, but the people are not doomed. The people, the land, the essence of the culture, the faith, the hope—and a better kind of charity, will remain.

The latest news from Europe is this: the condition of the people steadily improves; the condition of privilege steadily declines. It is not the war, nor the reparations, nor the debt, nor the indifference of America that ails Europe, it is the entire system of wrong, of which the war was but one result.

The governments become more and more insane; the people are becoming sane. Financial standards go down and down; the people's vision of righteousness goes up and up. Respect for artificial gewgaws grows less and less; the sense of fundamental merit grows more and more.

The explanation of the silence of the Europeans among us is just that: they know that what is now imperilled is the very thing that always imperilled Europe, and if its time has come to disappear, they are glad.

Paris, Berlin—what do they matter now? What a stupid world it is that looks to Paris or Berlin for news these days? What can Paris or Berlin say that is of the slightest account in the thing that is coming upon Europe? Paris and Berlin, neither of them, believes it has one sensible word to say, one coherent clue to the maze; they simply talk, as formerly they wound red tape—it is the automatic, incoherent mutter of dying systems.

Unfortunately we cannot say that this is intelligently discerned by our own government. But fortunately our own government is following the instinct which has usually led us into the right path. The world is waiting; the United States is waiting; but the waiting is without the educational effect it might otherwise have, because so many busy people are urging everybody to "do something." When the world is rocking in earthquake, there is nothing to do but stand still. Fifty years ago we might have taken a path that would have led us to another place than the one to which we have come. Those who urged it then were laughed at. Twenty-five years ago—yes, as late as Versailles, the world might still have "done something." Versailles was the last chance. Now, destiny is in the saddle. What the wisdom of the wise thought was foolishness, is being vindicated by the spirit of destiny. We would not clean up our own world, it is being cleaned up for us.

This, the vision of the times, these good and necessary and not-to-be-interfered-with times, should be considered by every thoughtful mind. Because it is true and interpretive. The problem of destiny is not to stop the disappearance of decayed systems, but to carry it on to completion—to clear the earth and save the people.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Real Life Found in Home—Kathleen Norris

That's Why She Takes the Kitchen and the Living Room for Her "Sets"

By FRED L. HOLMES

"I TAKE themes of home for my stories because I think most of the beauty and charm of life is placed in kitchens, in family sitting rooms with shabby books and shabby lamps, and in bedrooms where there are new babies, and sick children and old men and women."

KATHLEEN NORRIS

Kathleen Norris, who, a dozen years ago, made Americans wipe their eyes in wonder and lift their heads in respect over the story she had told of "Mother," was talking to me at her San Francisco home. During the intervening years she has written many other books and short stories. Some are already forgotten, but her story of "Mother" is like "Lorna Doone" and "Jane Eyre." It lives on. Age does not detract from its popularity.

It was because she wrote "Mother" that I went to see her. It was because the world is always in tribute to mothers, that I felt she must have some deep note of sympathy which guided her in the writing of the book.

"'Mother' was written when my first baby's arrival made me thoughtful about motherhood, its beauty and its trials, and I wrote it as sort of a tribute to my own mother, then dead several years," explained Mrs. Norris.

Two events have brought success to this author, according to her own judgment. First, a removal from California to New York to carry on early literary work, and second, her marriage to Charles G. Norris, novelist, and a brother of Frank Norris, now dead. nationally known because of his novels on "The Octopus" and "The Pit," which created such a furor of discussion a few years ago. Mrs. Norris' husband is the author of "Brass."

Society reporters on daily newspapers, women who believe that many men have a keener sense in business affairs, persons who have stumbled often in attempting to climb toward success, will find much consolation in the life story of Kathleen Norris. Because she was poor, she had to accept employment as a reporter; after she married she induced her husband to attempt to market the stories which she had written and which had been rejected, and when he succeeded, she announced her policy of making "my husband always my business manager." Because she failed so often before she got a foothold on the literary ladder, she will take time off from her most arduous duties to help others see the pathway.

Kathleen Norris was the daughter of James A. Thompson, long a resident of San Francisco; twice president of the famous Bohemian Club and at the time of his death, manager of the Donohoe Kelly Bank. Of the six children in the family, Kathleen was the second child and the oldest girl. Most of her education was obtained privately, a governess being furnished occasionally for language study. She got smatterings of French, German and Spanish—not much of any one.

It was in 1899 that the family moved to Mill Valley, across San Francisco Bay, and "Treehaven," a bungalow in the beautiful valley at the foot of Mount Tamalpais became the home. During this year, the 19-year-old girl was preparing to enter society. All was astir in the home—new gowns, dancing lessons, society conferences. One day the mother was striken with pneumonia and died within a few days. The broken-hearted father followed within a month.

Simultaneously the family fortunes were upset. The children had to go to work. Kathleen took work in a hardware store at $30 a month. Employment obtained by the others was not so remunerative and the family income totaled $80 monthly. The bugbear of "debt" hung like the sword of Damocles over their heads, but the hair that held it in suspension never broke.

Kathleen and her 15-year-old sister were the mothers of the family. Home at night they made the beds, cleaned up the house and did the cooking, And when the work was done, if it was not too late, Kathleen would tell stories. Next to the drawing of pictures of little girls with pigtails down their backs and wearing checkered aprons, this was the occupation she liked best of all.

Then Kathleen began to wonder if there might not be a future in story-telling. So in the autumn of 1903, she registered as a student at the University of California to take a course in English. After five months, she was compelled to resume employment. But within these months, she had sold a story to a daily paper for $15.50. This set her soul craving with literary ambition. For a time she worked as a librarian, then as a social settlement worker, and finally became society editor of the San Francisco *Bulletin,* and later a reporter on the *Call.* That she was a prodigious writer is evidenced by the fact that when President Roosevelt sent the Atlantic fleet to Pacific waters in 1908, she wrote 8,000 words of copy in a single day of the San Francisco visit. Marriage in 1909 did not settle the routine of her life. With her husband, she went to New York, where he had obtained magazine editorial work. So many rejection slips had come to her on magazine stories that she almost despaired.

One day there was a social party of young writers in New York to which she was invited. "It was pleasant for me to meet them and I enjoyed the afternoon," continued Mrs. Norris and a sweet smile reminiscent with final victory ruffled her stateliness. "My chief sensation was one of shock—it was a real shock to me to find that writers were people. I felt as if I had met George Eliot, Jane Austen, Charlotte Brontē, Joan of Arc, Cleopatra and all of the great figures of history, and found them to be human beings like myself. 'These writers are not supermen and women,' I said to myself, 'they are human beings like me. Why can't I do what they are doing?'"

The veil had been lifted and she told how on her way home she made a little resolve. She determined to write a story and sell it before the next meeting. This she did. She disposed of it to a daily paper for $12. It was published. Shortly afterward she got the prize of $50 for the best story of the week. For her the horizon was ablaze with future promise.

"I always wanted to write," Mrs. Norris confided as if she were unraveling some story of adventure to her 11-year-old son. "When I went to New York in 1909, the glamour that had always hung about successful writers faded away. When I met them I saw that they were just ordinary human beings, working instead of dreaming, and I began to work, too."

Mingled with the rejection slips with returned stories there came a little note from the *Atlantic Monthly* which in a day paved her path to literary fame. It read:

"Dear Mrs. Norris:

"The readers report that, delightful as your story is, it is 'not quite in our tone.' The feeling of the *Atlantic* is, that when a tale is as intimately true to life as this is of yours, the tone is surely a tone for the *Atlantic* to adopt.

"It gives me great pleasure to accept so admirable a story.

Very truly yours,
THE EDITOR."

On the publication of "What Happened to Alanna," S. S. McClure, the veteran magazine editor, who has made claim to the discovery of so many young authors, wrote her a complimentary note and asked for the next story. She replied by calling his attention to the date on which he had rejected the story for which he was now showering praises upon her.

One of the magazines for women had offered a prize for the best short story of 3,000 words. She attempted to enter the contest, but when her story ran to 10,000 words she laid it aside to write another. And the story which she laid aside was "Mother," which was later enlarged to a book of 30,000 words for which five publishers were clamoring at one time. It established Mrs. Norris in the literary world and gave her a reputation as a writer.

"Young writers are too easily discouraged," exclaimed Mrs Norris in telling of the many who write and call upon her for advice. "I have a feeling that a desire to write indicates the possession of the power to write. But sometimes I do not wonder that writers become discouraged. I had frightful discouragement —until I was married."

Then it was that Mrs. Norris told how her husband acted as her business manager. There is an alphabetical list of magazines, and in the early days he would start at the top of the list and send the story out until it sold. One story went out 26 times. The list had been exhausted and Mr. Norris started it over again. It sold the twenty-seventh time to the *Atlantic Monthly,* which had been the first on the list originally to reject the story.

"My husband is always my business manager, and handles every contract, novel, story, article, cinema right and copyright," she explained in showing one of the big peaks of her success. "Only professional writers can estimate what this statement means. It requires ability to sell a story as well as to write it.

"I think there must be just scores of people who write good stories, send them out for a few times and then lay them aside in discouragement. Young writers, like all others, must persevere. Keep on writing and sending out the stories. There is no other way to success, unless there is someone who can act for you in sending the stories to publishers."

Of the writings of Mrs. Norris the best known are: "Mother," "The Rich Mrs Burgoyne," "The Treasure," "Poor Dear Margaret Kirby," "Saturday's Child," "The Story of Julia Page," "The Heart of Rachel," "Undertow," "Martie, the Unconquered," "Josselyn's Wife," "The Beloved Woman," "Lucretia Lombard," "Harriet and the Piper," and "Certain People of Importance."

The gay, bright, slangy flapper of today is explained by Mrs. Norris in her recent volume, "Certain People of Importance," as the product of 150 years of immigration across the continent. She depicts the Crabtree family for these generations. Life in San Francisco is painted in detail. Although out but a short time, the novel already ranks as one of the 10 best sellers, and has been characterized by one noted critic as a "boulevard of life, with glimpses into innumerable houses and hearts."

Once poor, authorship has made Mrs. Norris comfortably well-to-do. Five years ago, Mr. and Mrs. Norris left Long Island, New York, to return to San Francisco to make their home. As both are writers, each has a separate study.

"We have separate studios on our California farm," remarked Mrs. Norris, "and both of us work all the year around from 9 a. m. to 1 p. m, and sometimes a few hours in the evening as well. The method is the same for all writers—work. Sometimes it comes easy, sometimes hard, but it is always work."

"Do you think the rich have all the joys?" I asked knowing that few characters of rich people are to be found in her books. She pointed to a volume of Dickens that lay on the table and told me that she read these works because the author so clearly saw the joys of the poor.

"What makes you think the rich have all the joys?" she asked with sudden gravity and earnestness. "I have been poor and I am rich and I know they don't—unless those joys are the same joys the poor can have, always, the joys of love and service.

"Why do people go on reading Adam Bede and Daddy Goriot and Dickens, except wistfully to glimpse those joys that money steals away?"

When the Thompson family was young, the boys read mostly from Sir Walter Scott, but Kathleen preferred Dickens. She said she still read this author with delight and declared there were passages to be found in his novels that are as good as any English literature except Shakespeare.

"I like him because he saw so clearly the joys of the poor," she explained. "Disease and despair were not the only things he gave to them."

Mrs. Norris is a tall, statuesque, beautiful woman with poise and grace—past 40. She has a matronly charm. The mother of several children, "we have been left but one son, and a foster son adopted years ago," she said. Mrs. Norris is essentially a home woman. That is why the problems of the home—the mother and the child—find so prominent a place in her novels.

As I left the home, the evening sun was flooding in through the golden gate, bathing the blue waters and mountain sides in a haze of brilliancy. Here amid these scenes had this kindly woman toiled and longed for success and here she had returned to enjoy its worldly laurels.

An Excerpt From "Certain People of Importance"

DIRTY, weary, but undaunted, the Crabtree family arrived in San Francisco late on a brilliant August afternoon, 1849. Tales of murder, death on the plains, the Indian outrage, met them on every side, and they felt themselves not only fortunate, but wise, in all their moves and decisions.

San Francisco, lying upon her seven sandy hills, looked civilized. There were few women to be seen among the jumble of cheap, wooden buildings, the Chinese "cookhouses" and "wash-houses," the saloons and gambling hells, the quarters where Mexicans and Indians and half-breeds of every type were housed together. There was a "Frenchman's" a "Dutchman's" and a "Swede's"——

The sugar and flour that had crossed the plains safely in 1849 had made a trail for tons of sugar and flour, for teas and coffee and other luxuries. They saw wealth come in and with wealth came schools and a library, "cable cars," theaters, shops. Magnificant homes went up like mushrooms on Nob Hill, the Vigilantes flourished at Fort Gunnybags, the Mexicans and the miners vanished, and with them the murderers and the riots.

More Weird Illusions of American Bankers

Here Are Facts Which Reveal an Abyss: The American Bankers' "Educational Propaganda" Has Not Explained Them: Can It?

By W. H. ALLEN

ANY discussion of the international money situation must include reference to American investments in foreign enterprises. If the estimates made are to be relied upon, we must be investing hundreds of millions abroad every year; and the total for the seven years reaches into the billions.

These estimates are based on the *theory* that our favorable trade balances have given us huge foreign credits to buy back foreign securities and to invest in foreign loans and foreign enterprises. This theory was originally exploited some 22 years when our big trade balances led our financial leaders to claim that, for the first time in its history, the United States had become a creditor nation. Among the most zealous exploiters of the theory 22 years ago was Mr. George E. Roberts, Director of the United States Mint. He is also an equally zealous exploiter of the same theory today. Addressing the Bankers' Club of Chicago, March, 1901, Mr. Roberts said:

"Our trade balances *are so large that to attempt to collect them in cash would ruin our customers.* A nation with *power to amass such credits becomes of necessity an investor in all parts of the world.*"

Two months later the financial world was startled by the announcement in the *Post,* May 22, 1901, that American bankers were borrowing large sums abroad!

Look at the List of "American" Capital

ABOUT that time Mr. Frank A. Vanderlip predicted that "New York would soon be the cheapest money market in the world." We have been waiting these 20 years to see that prediction fulfilled. It has never yet been fulfilled. London is a cheaper money market today.

Mr. N. J. Bacon, whose article in the *Times,* January 4, 1902, was widely quoted, as authoritative, estimated that our investments in foreign bonds and foreign enterprises averaged $144,000,000 a year. Most of this amount was supposed to be going into Cuba, Mexico and other South American countries. Referring to our ventures in Cuba, Mr. Bacon mentions "one company, Mr. Van Horne's, that has been at work building a railroad along the backbone of the island." The only person of that name interested in Cuban exploitation at that time was Sir William Van Horne, the well-known railroad capitalist of Canada. This may give us a clue to the different parties who are masquerading as American capitalists. Much alleged American-owned money has, in the last quarter of a century, gone into railroads, banks, tobacco and sugar plantations, and mining properties in Cuba and Mexico; but a glance at the names shows that most of the investors are Canadian capitalists, and New York bankers such as J. P. Morgan, Kuhn, Loeb & Co., and James Speyer & Co. are really agents of foreign capital.

The purchase of the $35,000,000 Cuban gold bonds of 1904 by Speyer & Company was much exploited at the time *as an investment of American capital.* But the notice of redemption of these bonds in 1913 was authorized by the following bankers:

Speyer & Company	New York
Speyer Brothers	London
Laozard Speyer-Ellison	Frankfort
Deutsche Bank	Berlin
Credit Lyonnais	Paris
H. Upmann & Company	Havana

Most of our surplus capital is supposed to have gone into Mexico. In 1913 Senator A. B. Fall, of New Mexico, estimated our Mexican investments at more than $1,000,000,000, or more than those of England, France, Germany and all others put together. "Citizens of the United States," said the Senator, "have built practically every street railroad, every electric line, every power transmission line, and practically all the railroads."

This statement was challenged by Mr. E. T. Simondetti, the widely known editor of *El Diario,* the leading newspaper in the City of Mexico. In an article in *Leslie's Magazine* (1913) Mr. Simonditti quotes Mr. Luis de la Barra, London financial agent for Mexico, to the effect that "the great bulk, nearly seven-eighths of the $550,000,000 Mexican railway bonds, is owned in Europe and Canada. One proof of this is that Mexican railway bonds are very active on the Paris and London markets, but seldom quoted in New York."

In 1902 when Mr. Bacon was exploiting our Mexican investments, the total sales of all foreign securities were just five bonds, all of them being Mexican 5's. In 1903 the sales amounted to eight bonds of the same issue (*Post,* April 23, 1904). The same statement will apply to the business in all such securities in every year up to the outbreak of the World War.

Mr. Simondetti notes the fact that *American Bankers* have been active in arranging the issue of Mexican bonds *to be sold to European investors* and that they continue *to represent these purchasers.* The agency is American, but the capital is foreign. This is confirmed by the Mexican correspondent of *Current Opinion* (New York) April, 1913, who says:

"There is more foreign capital in the national railways of Mexico than in any other undertaking. An inspection of the stock book of the 'National Railroads,' a government institution, would reveal a large proportion of English stockholders, and a large amount of stock registered *in the names* of *citizens* of *this country which is in reality owned* by *English stockholders.*"

This applies not only to stocks of Mexican railways, but also to 90 per cent of the foreign investments in public utilities, banks, mines, mineral lands, industrial plants and other enterprises in Mexico and every other country. The New York bankers, J. P. Morgan & Company, Kuhn, Loeb & Company, Speyer & Company, Ladenberg, Thalmann & Company and Seligman Brothers, who are masquerading as representatives of American-owned capital, are really agents of Canadian and European capital. When Senator Fall says that American citizens built practically every street railroad, every electric line and practically all the railroads, he gives the impression that American capital built and still controls these properties. But it is safe to say that not 10 per cent of American-owned capital went into them.

The publication in 1913 of the banker's estimate of our annual foreign debts settled this whole question beyond all controversy. According to these authorities our annual foreign debts approximated $1,400,000,000. With trade balances averaging $500,000,000 as a partial offset we were piling up a deficit of $900,000,000 every year. Instead of exporting that amount of gold to square the account we sold securities abroad.

This estimate was not publicly contradicted at the time, although it convicted nearly every financial writer in New York of gross ignorance of the international money situation, as it proved that so far from having hundreds of millions of surplus capital for foreign exploitation we were running behind and piling up a deficit of nearly a billion dollars every year. It was our constant sale of finance bill short-term notes, and long-term bonds abroad to avert exports of gold in settlement of the deficits that caused us to be recognized in Europe as the greatest of borrowing countries.

Nevertheless, as soon as the World War had increased our export trade these same financial writers began to repeat their stories about the United States being a creditor nation again. They got their inspiration from such sources as these:

"The United States today maintains the world's financial equilibrium. America is the money country; New York is the greatest of all money markets. The American dollar rules in the world's exchanges. Thus we should hold our supremacy for many years, and control the world's production, transportation and finance." (Max May, vice-president, Guaranty & Trust Company.)

Evidently Mr. Max May hadn't heard that at that time (August, 1917), according to the Lausanne *Gazette, our American dollar was lower than at any time since the Civil War.* In Denmark, Holland and Sweden it was worth only 88 cents, and went lower still later on. A Paris dispatch, June 23, 1916, to the *Post* stated:

"After many days, certain New York banks are placing money largely in Spain, for development of the territory and securing direct trade relations with the United States."

American Dollar Always Comes Out Worst

THAT was the banker's explanation of the efflux of gold at that time. It was intended to hide the truth, and make it appear that we had surplus capital to invest abroad. But two months later the *World* reported that "New York banks had been shipping large amounts of gold to Spain in settlement of balances due on account of supplies furnished by that country to the European belligerents." This movement continued into 1917 when it caused severe money stringency, near panics, on the Stock Exchange and forced the government to place an embargo on further shipments of the yellow metal. This refusal to pay gold caused *the discount of our dollar to rise to 45 cents,* and Spanish bankers refused to sell us any more war supplies without a deposit of gold in part payment. Then Mr. Otto Kahn went to Spain and arranged for a loan of $100,000,000 in credits to stabilize our dollars.

Now the fact that this discount on our dollar prevailed in all of the neutral countries proved very clearly that the statement of Max May that "the American dollar rules in the world's exchange" was absolutely false. And hence, too, the Paris dispatch to the *Post* that New York banks were sending the gold to Spain for developing the territory was equally false. They were sending the gold to pay for supplies to the Allies.

In 1917 at the very time that our dollars were shrinking in every neutral country, Mr. George E. Roberts, then assistant to Frank A. Vanderlip, of the National City Bank, predicted that the end of the war would find us with more gold than we needed and we would have to invest it abroad. The war having ended, Mr. Roberts tells us that the Allies can't pay the debt of $10,000 000,000 principal and interest. He says:

"About the only course open to us is to reinvest it abroad. *We are out in the world to stay because we can never get our belongings home.*" This is almost word for word what Mr. Roberts said 18 years before, when, as it was afterward learned, our bankers owed Europe several hundred millions. But the situation was very much worse around August 14, 1919, when he was giving out this latest piece of advice.

As noted in previous articles the hoards which migratory aliens accumulated during the war totaled $4,000,000,000; and foreign banks had credits here of more than $6,000,000,000 more. In short, the combined foreign credits about offset the allied debt of $10,000,000 000. Also, in spite of a trade balance of $4,000,000,000, gold was going abroad, causing high money rates, panics and near panics and, according to influential bankers, endangering the safety of the gold standard. In fact our money market was in a much worse condition than that of England, the country that owed us nearly half of the Allied debt; for while money was worth 10, 20 and 30 per cent here, it was reported as being "dirt cheap" in London, rates of 2½ and 3 per cent being common even in those days.

Mr. Roberts' view of the matter is approved by Mr. Hoover, and Controller of the Currency Crissinger. A statement recently submitted to Congress announces that "we lead all others in the race for world trade. The British are becoming alarmed at our rapid growth, and *Germany* is *not considered a serious competitor* in *South America.*"

"We are all agreed that the determining factor in establishing the direction of foreign trade is the amount of capital invested abroad, at the present time our investments abroad amount to no less than $21,750,000 000."

Here it is assumed that the Allied loan and the foreign bonds floated here since 1914 are really investments of American capital abroad. But as I showed in the last article most of the bonds floated here by the neutral countries of Europe and South America were really disguised payments of debts, incurred to stabilize our dollar abroad, and in purchasing war supplies. *We were paying a debt and calling it a loan.*

Dr. Klein, Director of the Bureau of Foreign Commerce, writing on this subject in the *Post* of December 31, 1922, compares the progress in our export trade last year with that of 1913 because it makes a better showing than if compared with 1921. And he lays stress on the increase in the latter half of the year, when as a matter of fact it is always larger in the autumn when agricultural exports are heaviest. But he does not cite one single case where these alleged loans have increased our export trade, or established one real American enterprise in foreign countries.

American Banks Beaten Back Home

REFERRING to our alleged loans of $220,000,000 to Latin-America, he says, "It is true that in many instances these loans were used for improvement of the position of temporarily embarrassed governments. But there has been also a gratifying allocation of funds for necessary public works and other reproductive purposes." That is about as near as he gets to proving that all the loans floated here will increase our export trade, or establish American enterprises in South America. Reference is made to investments in oil properties in Bolivia. But there is no proof that the investors are handling American-owned capital. They are most likely dummies for foreign investors as is the case in Mexico.

"The most notable activities in South America," says Dr. Klein, "have been those of Columbia and Argentina. American capital has been quite active in the former country. . . . Furthermore, the services of the 60 branches of American banks have given a *tremendous impetus* to the development of direct distribution."

Now in August, 1921, the National City Bank announced "the closing of its three branches in Baranquilla, Bogota and Medilin, Columbia, because of the disruption of exchange and the *slump in business.*"

Where did Dr. Klein get his information?

And the closing of these three branches was only a sign of a wider movement, concerning which the Federal Reserve *Bulletin* (November, 1921) says:

"The striking aspects of the financial development on the banking side in connection with foreign trade is found in the fact that there has been *a steady and extensive withdrawal of American banking institutions from the foreign field.* One reason given for this action was that German, British and French firms were able to offer *distinctly more favorable terms.*" That is to say, they could give longer credits and lower rates.

How these foreigners, that have borrowed billions from us, and are crying for more, can grant longer credits than the merchants of the world's credits nation is another one of those freak incidents which befuddle the lay mind. The explanation is that these branch banks were mostly disguised agents of foreign, chiefly German, banks, formed during the war to continue the business. And the disguise was more easy because the parent banks (like the National City) were largely controlled by agents of the same foreign banks. When the proper time arrived the foreign banks opened up again, and our branches quietly withdrew.

The withdrawal of these branches has continued to the present time.

Our professional business forecasters seem particularly anxious to prove that we are going ahead of Germany. Mr. Hoover has told us that "Germany is growing weaker" in the foreign field. The Washington correspondent of the *Tribune* (December 31) also informs us that "Germany is not considered a serious competitor in South American trade."

James A. Carson, president of the Pan-American Advertising Association, is another Jonah on German prospects. In the same issue of the *Tribune* he says that *"German competition wanes.* She is becoming less and less of a menace in South American trade. The scare of German competition is subsiding." But he makes some statements which conflict with the foregoing. Thus he says: "They are beating us on prices in many lines at present. . . . Today Germany is a bothersome contender in many South American markets, and the average buyer sees only a continuance of her efforts. . . . Great Britain is holding her own, and in places gaining in South America. . . . In the recession from war-time peaks *British trade is ebbing much less than that of the United States,* notably in Brazil. *This is also true of some of the other southern markets.*"

"But South America is turning to the United States

(Concluded on page 8)

A Study of Race Influences and Immigration

Our "Firm Feeling Under Foot" Gone Because of Influx of Undesirables

By LEWIS WORTHINGTON SMITH
ENGLISH AND COMPARATIVE LITERATURE, DRAKE UNIVERSITY

WE ARE being told rather vociferously in some quarters that the pronouncement that all men are created equal, as we have it in the Declaration of Independence, is a pledge that America shall be the world's melting pot. The unity of the human family was not a thing that the fathers were quite sure of, even in their assertion of it. George Washington and Thomas Jefferson and John Adams could never have debated in any scientific fashion the problems of heredity and environment. The facts were not known. Indeed, they were hardly suspected. The problem is chiefly a problem of biology. To deal with it as question of political theory and the rights of man is more or less futile. If man were now one, if all the races of men were practically the same in their characteristics, the biological fact would be of no moment. The conditions of existence are so different in the different sections of the globe that the survival of the fittest, broadly speaking, has in one place favored the permanence of the cannibal and in the other the permanence of the enemy of the cannibal. This racial differentiation through the evolutionary process has been going on for thousands of years, and it is worse than foolish to think of undoing it by intermarriage within any period of time brief enough to be genuinely interesting to those of us who are making America today.

To open our gates to the entrance of anybody and everybody from all the four quarters of the earth, is to fly in the face of the facts.

Inasmuch as this is a scientist's question, not a demagogue's question, not a political doctrinaire's question, we shall have to listen to the word of the biologist for the conclusions upon which we must base our thinking. Michael E. Guyer, professor of zoology in the University of Wisconsin, in "Being Well-Born," reports that:

"By this (the biometric) method Professor (Karl) Pearson has shown that such mental and temperamental attributes as ability, vivacity, conscientiousness, temper, popularity, handwriting, and so on, are as essentially determined as are physical features through the hereditary endowment."

In "Heredity and Environment in the Development of Men," Edwin Grant Conklin, professor of biology in Princeton University, makes a statement of like character no less positively.

"All peculiarities which are characteristic of a race, species, genus, order, class and phylum are, of course, inherited, otherwise there would be no constant characteristics of these groups and no possibility of classifying organisms. The chief characters of every living thing are unalterably fixed by heredity. Men do not gather grapes of thorns nor figs of thistles. Every living thing produces offspring after its own kind."

In "Genetics and Eugenics," W. E. Castle, professor of zoology in Harvard University and research associate of the Carnegie Institution of Washington, adds to these conclusions a further conclusion that is of immediate moment in the present state of the immigration question in America.

"Offspring produced by crossing such races do not lack in vigor, size or reproductive capacity. But these are not the only qualities which we desire either our horses or our citizens to possess . . . . For such reasons wide racial crosses among men seem on the whole undesirable."

It Is Biological Judgment

THIS last sentence is, of course, the expression of a judgment only, but it is a biological judgment, a judgment based upon findings in that field of research from which the decisive results of investigations touching this subject must come. The theoretical wisdom of the fathers in the closing quarter of the eighteenth century, in the face of this wisdom of accumulated knowledge, is fairly negligible. It is merely, to quote the words of John Moffatt Mecklin, professor of philosophy in the University of Pittsburgh, in his "Democracy and Race Friction," "the uncritical humanitarianism which denies the existence of any race-problem except that of our own creation."

On the part of some of the disciples of this "uncritical humanitarianism" there is a disposition to assert that the man of one race is as capable and efficient as the man of another. The evidence brought forward in support of this position is the example of a relatively great man here and there in the ranks of those races that may possibly be supposed to be inferior. These examples do not reach the point of quantitative comparison as presented. They do not constitute a demonstrative showing of the equality of capability that is in question. Even were they sufficient for that end, however, they would not settle the real question at issue. Accepting them as final, we would merely have evaded the actual problem.

In his Message to Congress of October 1, 1888, President Cleveland said:

"The experiment of blending the social habits and mutual race idiosyncracies of the Chinese laboring classes with those of the great body of the people of the United States has been proved by the experience of 20 years, and ever since the Burlingame treaty in 1868, to be in every sense unwise, impolitic and injurious to both nations . . . .

". . . . This has induced me to . . . . answer the earnest popular demand for the absolute exclusion of Chinese laborers having objects and purposes unlike our own and wholly disconnected with American citizenship."

Here in a diplomatically guarded way President Cleveland brought to the attention of the American public the thing of most importance in the immigration problem. It is not difference in mental capacity that most certainly separates men racially and makes their free mingling together "unwise, impolitic and injurious." The trouble is deeper than that in "objects and purposes in life," in "social habits and idiosyncracies." The substantial basis for pleasant association together on the part of men and women is not equality of intellect. That should be existent in some degree, but the thing of first importance is a reasonably harmonious sense of human and social values. As the circle of association narrows, too, this bond of a common outlook must more or less include some agreement with relation to moral values. In spite of current clamor to the contrary, life cannot be intelligently discussed or measured in disregard of such considerations.

It is not necessarily a lowering of character alone to which we should be and must be unalterably opposed. As far as we feel that we have constituted ourselves a people and have developed a life and a spirit of our own, we must resist anything, not in the way of betterment, that tends to deflect that life from its general course and direction.

It is contended, of course, that mixed races have an advantage over pure races in the struggle for existence. In a degree the English race to which we belong is itself indeed a mixed race. It serves, therefore, as illustrative confirmation of that belief, but it is conjecturally illustrative only, not at all demonstrative. What Professor Mecklin, whom I have already quoted, says on this subject seems to me to be more than pertinent.

"The great contributors to culture and human progress have always had back of them the temperamental characteristics of a pronounced racial type. This is true, for example, of the art of Greece, the jurisprudence of Rome, the philosophy of Germany, or the poetry of England. The larger social self of the cultured modern may indeed present oftentimes a variegated appearance, but underneath it all one can still detect an ethnic background of race traits and temperament that alone harmonizes the complex elements as does the background of a picture and gives to the intangible thing we call personality 'a local habitation and a name.'"

Problem Is Ours Alone

THE problem of the mixing of races is a problem for Americans as it is a problem for no other equally large body of people on the globe. England is full of her own children. She needs not seriously concern herself about a possible influx of aliens. France is not in danger of being overrun by those who will divert the current of her social and national existence. Germany has enough to do to take care of the population she already has. Not many of other blood will go there to seek their fortunes. America is the lure for all the restless and the dispossessed of the world, and so great is that lure that more than a million immigrants came to the United States in 1910. Of that number nearly two-thirds came from Austria Hungary, Italy and Russia. The peoples of these countries are nearly all of them products of alien ways of living and of alien conditions that have been shaping their lives for centuries. The immigration from the countries where life is more nearly like our own, France, the Netherlands, and Great Britain, was less than one-sixth of that from these countries.

Whether the foreign-born and those born in this country of foreign parents are as law-abiding as the native-born of our older stocks is a question of importance. The problem is naturally a complex one, but the outstanding facts are significant. John R. Commons, professor of political economy in the University of Wisconsin, reports, in his "Races and Immigrants in America," that "the native-born children of immigrants show a proportion of criminality (5,886 per million) much greater than that of the foreign-born themselves (3,270 per million), and 70 per cent greater than that of the children of native parents."

In striking confirmation and accentuation of this, Professor Commons shows further that criminality of "male juveniles per million of male population 10 to 19 years of age, North Atlantic states," for the year 1890, was as in the following table:

Native white, native parents	1,744
Native white, foreign parents	3,923
Foreign white	3,316

These figures showing that the children of foreign parents have criminal tendencies more than twice as high as those of the children of native white parents are not to be explained away. Doubtless there are circumstances that make possible some minimizing of their significance, but they can be nothing less than an indubitable sign of a menace to American life in the presence of the stranger within the gates.

In the same book by Professor Commons from which quotation has been made there is a sentence that comes very close to the heart of the question.

"That the frenzied spirit of the mob, whether in strikes, panicky militia, Indian slaughter, or civil war, should so often have blackened the face of a nation sincerely dedicated to law and order is one of the penalties paid for experimenting on a problem of political and economic equality with material marked by extreme racial inequality."

There Should Be Unity of Aims

ONE of the methods of approach to this subject is that by the way of comparative literature. It is in literature that the characteristics of a people are most intimately and fully revealed. That all peoples have not produced literatures either of like quality or of like showing of human traits and modes of life is clear enough. None the less in a fairly recent book, Gustav Pollak's "International Perspective in Criticism," the author says in the introduction:

"'I am convinced,' says Lessing, 'that no nation on earth has a monopoly of intellect in any of its manifestations. I know very well that people talk of the profoundly serious Englishman and the witty Frenchman, but who has made this distinction. Surely not Nature, who impartially distributes all her gifts . . . .' We have in these words an implied declaration of his belief, borne out of all his teachings, that intellect recognizes no distinctions of nationality, race or religion.

"Chauvinistic criticism of foreign achievement is merely inability to criticize at all. Herder condemns the expression, 'races of mankind,' as ignoble words."

This has a pleasantly generous, idealistic, and humanitarian sound. It will easily deceive the thoughtless, but the pronouncement is sentimental and nothing more. It is not at all scientific. The author's effort to support his contention by quotation from Lessing and Herder is by nearly a century too late. On this subject, as perhaps in general, they were neither of them as wise as the man who was chiefly responsible for the writing of the Declaration of Independence.

In a democracy it is important that its constituent members should have some unity of social aims and purposes. Two men whose destinations are one east and one west from their common starting point will not reach those destinations most surely by journeying together. Disagreement with relation to methods of achieving common aims and common purposes is another matter. That is both inevitable and healthy. Decisions with regard to ways of bringing things about should come from an exercise of the judgment, not from the ebullition of antagonistic passions. In a country to which there is free entry for all the races of the globe, the maintenance of that social solidarity that is one of the finest fruits of national life is almost impossible. Already we have in no small degree lost the comfortable sense of having something firm under our feet. If we are not to lose that altogether we shall need to be wise in time. Before the rising tide of immigration, following the war, again approaches the million mark, we should arrange to stop on the other side of either ocean something like 99 per cent of the invading host.

More Weird Illusions of American Bankers

Concluded from page 7

for her financial needs. In the last 18 months more than $350,000,000 worth of Latin-American bonds have been floated in New York."

Here we get a glimpse of the truth of this matter. South America is buying German and English goods with the money she borrowed from New York. But it is not American-owned money that was borrowed. The bonds were taken by Kuhn, Loeb & Company, J. P. Morgan and foreign bankers. It is foreign-owned money that is financing the trade. In short, Germany is financing her South American trade with the gold she has been sending here and credits she earned on her investment in this market.

But a derrick wouldn't drive that simple fact into the head of Mr. Hoover, or any one of his aids.

The Argentine loan floated in this country prior to 1922, which Messrs. Hoover and Crissinger are relying upon to boom our foreign trade, *was really used to boom German trade.*

There has been much boasting about the great strides in our shipping industry on the Pacific Coast, and the great growth of the Harriman lines is cited as an instance. But Mr. W. A. Harriman is just as much an agent of Kuhn, Loeb & Company as was his father, the late E. H. Harriman, and the ships which he manages are just as much German, as is the Hamburg-American line.

In these articles in THE DEARBORN INDEPENDENT I have sought to prove that so far from being a creditor nation to the extent of $21,750,000,000, we are really a debtor nation to the extent of more than $15,000,000,000. *If my view of the matter is correct then the bankers who originated this creditor nation claim are guilty of having exploited a deliberate and dangerous falsehood.* And these bankers have thus far failed to answer the arguments advanced in these articles.

But the hour is at hand when they will have to answer. For it is the same bankers that have organized this campaign "for the education of 'economic illiterates' as to the dangers of printing press theories of money." At the very outset of this campaign they will be confronted with questions relating to the gold standard and our ability to maintain it. And one of the questions will be:

Does the stock of gold now in the United States actually belong to American citizens?

A second question will be: *Does the billion of gold that has come here in the past two years really belong to American citizens?*

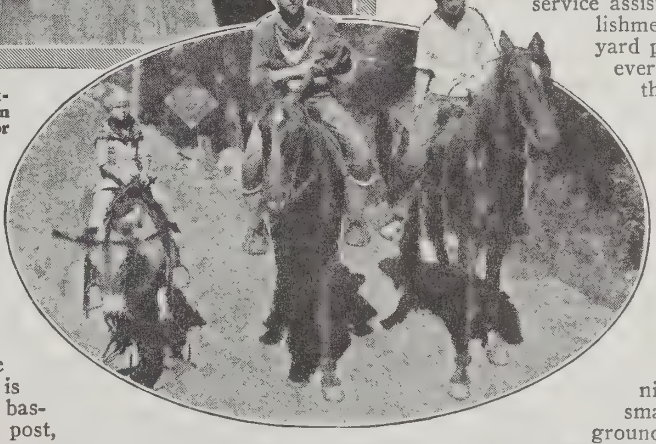
What answer will they make to these questions?

Taking the Playground into the Home

Interest, Enthusiasm and Assistance of Parents Obtained in Oakland, California

THE public playground, whether connected with a school or operated for the general benefit of all the children, has become an integral part of the life of a modern municipality. At first, the playground, then small and compact and not widely advertised, was heralded as the master attraction which would keep the children off the streets, reduce accidents, give the youngsters a place to work off their enthusiasm without getting into mischief, and help to bring to manhood and womanhood a healthier generation of human beings. All these things it has been proved the playground does—for children above a certain age—but the modern city has become too complex for the small child. Rapid transportation has monopolized the city's streets, making it dangerous for the child of less than 10 years of age to go to or come from the playground. What to do with the children of this age, too young to travel alone or even in groups to the public playgrounds, and too young in their games and recreations to enjoy association with the older children who have come to regard the playgrounds as their especial property, has become a problem of the parent and the home, rather than of the municipality, which cannot—or usually does not—offer aid in its solution, since it obviously cannot establish a playground in every residential block, or provide guardians for every child on his or her trip to or from the playground.

Here is a girls' club from one of Oakland's grammar schools working on beaded bags, embroidery and toys for Christmas presents for their small friends in one of the public school playgrounds.



JAY B. NASH,

Superintendent of recreation for the city of Oakland, who is the originator of the idea of the back yard playground, is shown here with Mrs. Nash and their little son, returning from a trip into the hills back of Oakland.

The city of Oakland, California, which has had some experience with playgrounds, their establishment and management, since it has 51 playgrounds, one lake recreation center, seven evening centers, four picnic grounds, an intown camp and a mountain camp, has met the playground problem of the small child, however, in a manner which has proved successful for its 400,000 inhabitants, and which, apparently, would work out as well in other communities, either larger or smaller than this. The plan is, briefly, to take the playground to the child who is too small to take himself to the playground. To do this it is essential that the interest, enthusiasm and assistance of the parents of the children be obtained. This has been done through the recreation department of Oakland, of which Jay B. Nash, a man who lives the wholesome outdoor life which he teaches to the children of his city, is superintendent, and which maintains a staff of 10 experts in recreational activities just to provide the children of Oakland with clean, healthful and abundant recreation.

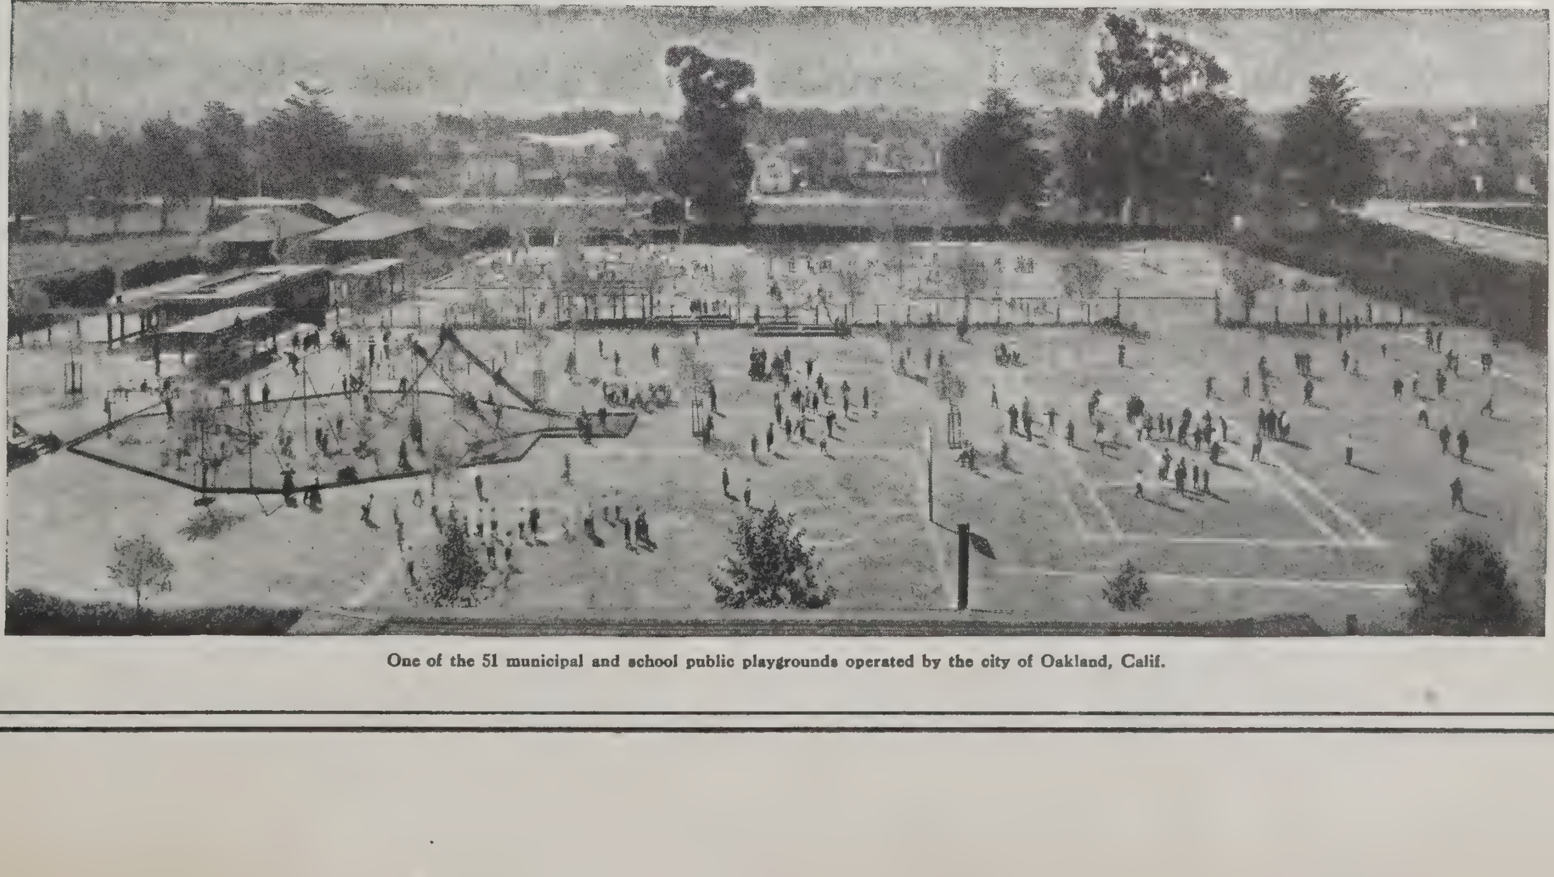
Mr. Nash is the originator of the plan to take the playground into the home. He tried it out first on his own children, in their own back yard, and it was so instantaneously successful that he persuaded other parents to try it, with the result that child accidents have been reduced, small children are kept off the street, even in the most congested parts of the city, parents are relieved of the worry of constant watchfulness as to the whereabouts of their small children, and the health of the children is steadily improved. The plan is simply stated, and simply executed at comparatively small expense. It comprehends the placing in the back yard of every home in which there are small children, of a playground, equipped with such apparatus as a slide, a turning pole, swings, sand box, hand ball court against the wall of the garage, if there be one, and, if there is room, a basket ball basket on the regulation post, where the children can practice throwing the ball.

Such a home playground can be installed in an area 40 by 20 feet, if there is no more space to be devoted to it; a still more complete equipment can be put in 40x40 feet, and so on up to the largest yard available. The majority of the lots in the residential sections of California cities are from 40 to 50 feet in width and from 125 to 150 feet deep. Deducting the space required for cottage and garage from even the smallest of these leaves abundant room for a back yard playground, and the complete equipment for either the 40x20 or the 40x40 foot space can be installed at an actual cost of $40, provided father does the work of setting up the equipment when it is delivered. Mr. Nash's own back yard playground, fitted up on a small area, both as an experiment and for his own children, cost him exactly $38, though he set up the swings, turning poles, slides and other equipment himself.

In cases in which there are a number of small children in the homes in a neighborhood, several families usually club together, in Oakland, and purchase the equipment, setting it up and allowing all their children to use it. This still further reduces the per capita cost, yet makes an even more effective back yard playground, because the children are more contented to play in it, and are better amused, when several play together. Experience has shown that it is inadvisable, however, to allow more than eight or ten as a maximum of small children to play in one such limited playground, since the equipment is not sufficient to accommodate more than this number.

The Oakland recreation department provides diagrams of yards, estimates of area which can be devoted to this purpose from any given yard, and lists of equipment suitable for the space to be used, as well as prices on that equipment, to all parents contemplating the establishment of a back yard playground. The city, of course, bears none of the expenses of installation or purchase of this equipment, since it belongs to the families interested and is installed on privately owned ground. All surveys, estimates and other service assisting in the establishment of the back yard playgrounds, however, are free, and the experts of the recreation department have made scores of visits to back yards in the residence district to advise on the installation of these miniature playgrounds.

Mr. Nash has laid out definite plans for the small yard playground, which have been approved by the recreation department of the Oakland city government, and which have been distributed to virtually all the parents in that city. A number of such playgrounds have been installed, and the result has been even more satisfactory than expected, in every instance. Without minimizing the value of small vegetable and flower gardens, or the raising of chickens and rabbits as methods of arousing and keeping the child's interest in the home, Mr. Nash, with the approval of the recreation department, has listed the simple equipment as essential for the back yard playground.



One of the 51 municipal and school public playgrounds operated by the city of Oakland, Calif.

Washington's Deathblow to Newspapermen

The Passing of the Reporter and With Him the Glory of Free Journalism

By "OBSERVER"

THE years that marked the decline of newspapers and magazines as voices and as mirrors are not many—perhaps an even dozen—and this decline has been accompanied by the commensurate squelching of reporters worth the title. "Reporter" is an honorable professional title, whose humble and even plebeian sound has caused it to fall into disfavor with that younger group of literary aspirants who prefer the pleasurable cadence of "journalist," although experience has taught that the journalist is the fellow who borrows four bits from a reporter. Correspondent and "newspaperman" are elastic variations and because they may mean anything, like journalist, it is only the tried and true professional who, being correspondent and journalist, does not mind describing himself a reporter.

When an inborn, ingrained and inveterate reporter discovers an editor and a periodical—the two go together—who give him a chance to go the limit of his discretion, ability, knowledge, experience and originality, for the sake of that public service to which journalism should ever dedicate itself, he out-Romeos Romeo in his devotion. He likes to consecrate his professional self to that trinity of reader, editor and journal. He enjoys his task as much as the mechanic loves the purr of machinery in motion, as much as the sailor likes a bit of wind at sea, as much as the priest likes his religious rites.

Articles about reporting, and how to be a reporter, and what the reporter must do, and what are his rewards, have been many. But this article exposes what has happened to the reporter and why. Unlike the others, this article may have the effect of discouraging reporting as a field of endeavor except for hardy souls who would not hesitate at anything requiring moral, mental and physical prowess, because all three are now necessary for the reporter's self-protection as a laborer.

The Real Reporters Suffer

BY REPORTER, to begin with, is not meant the beginner at the bottom of the literary ladder, whose professional future may be in his keeping and may not—likely not—nor the fellow who finds a niche at some intermediate point and settles there, whose chief task is to write up the various daily happenings, church socials, court proceedings, fires, crimes, accidents and other routine, some of which occasionally are events that call for brilliant reporting. It excludes, of course, the vast army of amateurs, who form one group, and of the hangers-on, half-baked Bohemians who peddle "pieces," and whose only claim to the profession is a more or less fleeting connection with some periodical. And last, but not least, it must ignore that growing shoal of "reporters" turned out by schools of journalism, the latest academic fashion like "foreign trade schools."

Mr. Chester S. Lord, writing recently about reporting, referred to the ambition of the cub reporter to see his name on the front page of a famous newspaper as its recognized correspondent. This achievement must engender satisfaction, and excite pride, but this is a new editorial fashion, in the newspaper world, impartially and even recklessly followed, judging by the vast acreage of signed material appearing today. Formerly the best work was all unsigned, the glory going to the paper. Then came the time when the chief political reporter was privileged to sign his name to his articles, because he traveled considerably. The sporting pages were first opened to the indiscriminate use of signatures, probably because it would lead to a personal following.

Oddly enough, this anomalous procedure has come at the very time when newspapers, more so even than magazines, have lost nearly all personal touch with their readers, and when readers, on their side, having lost a corresponding intimacy with their periodicals, care as much for names of writers as they do for the names of the paper manufacturers.

There are, needless to say, many good writers, political or diplomatic or both, whose natural skill suffers in the pot of "policy" which seasons the news or facts, whose *voice* is muted in favor of the policy's falsetto. Among these will be found the reporters who must write negatively of that which given newspapers or magazines proscribe, overtly or by sleight of hand. A few years of this sort of work will tend to atrophy the writer's independence of thought and analysis. Selfishness or partisanship thus impairs the reporter's chief treasure—impartiality.

War Didn't Help Some

EDITORIAL exigencies do not always conduce to a reporter's improvement even when this comes by way of promotion. Becoming "war correspondents" ruined countless good police reporters and a few middling-to-good local political writers. They were hustled first to Washington and thence abroad with little or no preparation. It was like putting them from a milk diet to a whisky diet. Europe has always been a tough bone for the American newspaper man, and prior to 1913 it was quite inhospitable to those who visited there professionally. The false democratizing influences born of the war, which enabled many a disorientated writer to be welcomed by quite prominent foreign officials as though he were the only pebble on the beach, led to many a sudden and meteoric rise in "diplomatic journalism." What this actually meant may be tearlessly examined after President Wilson, in Europe, did the best he could for the American newspapermen—a well-censored press headquarters. The war-time interview, like the present peace-time interview, was propaganda and nothing more. This propaganda, sometimes well disguised, was such that even editors failed to recognize; they played it up as news.

The status of the American correspondent abroad is hardly complimentary. A few have established a few friendships with "sources of information," but two-thirds of these may be discounted outright as further propaganda. Many an American correspondent abroad, and his editor here, have failed to realize that too many foreign officials have been playing politics and jockeying for official betterment through the columns of the American newspapers. Blame attachés, of course, to the editors or owners—for often these foreign jobs are endowments of the proprietors upon a favorite staff man.

So difficult has this foreign work been that it has stubbed the toes of two or three men who, having attained popularity in the magazines, proceeded to exploit it abroad, which led to having some of their reports repudiated officially through the press associations. This repudiation in no wise impugns their veracity, but it is a sad commentary in that they violated the first rule of national reporting—signed authentication of all quoted material.

Reportorial penetration of foreign lands is a laudable American enterprise, but so far it has failed because it has been both immature and injudicious. The writer of these facts anticipates publisher or editor who would protest against that statement by pointing to the popularity of their correspondents and even to the circulation of their newspaper, by declaring that this "popularity" exists only in those countries that *expect* something from the United States. Those countries laugh at the queer "European edition" of certain American newspapers, the chief function of its reporters being to print the name of every tourist from "back home," and some of the latter's quoted absurdities to boot.

As a matter of fact, the few American correspondents abroad, and more specifically in the chief Continental countries, are treated no better than they are treated in Washington. One might well suspect that the Washington idea today is the very pattern copied in other capitals. The reporter there, unhonored by the very men he has helped to make, cannot expect more from those who owe him nothing.

The reporter of national affairs was a power unto himself a few years ago. His stature was such that he exacted respect and this was accorded to him ungrudgingly. His dispatches at that time were not "publicity" of doubtful value and color, but they were the measure of co-operation which he, as a member of the Fourth Estate, could give. In proportion to the value of what he wrote and the importance of the newspaper employing him such a reporter meant something to the profession and to the editors and owners above him.

He's Been Squelched, That's All

BUT the Washington correspondent has been squelched.

No one has done it; but many have done it.

First, Taft's indifference; second, Wilson's intolerance, and now Harding's despotism.

Today nothing can be written by a Washington correspondent, even anonymously, that may be unpleasant to the administration that he will not hear of it, and soon. The same condition existed under the last administration, though its system was somewhat different. Taft ignored—and smiled, until the campaign.

At that time, in 1912, the newspaper correspondents in Washington could almost make or unmake a President. The reporters who belonged to this group were not many. There were a few Roosevelt cuckoos among them, and probably a few who did not mind encouraging a change for the sake of variety. Wilson managed to do without cuckoos because he trusted his more or less personal representatives for his "feelers," but Harding has made cuckoos of all of them. Roosevelt's Washington favorites were J. J. Dickinson, E. B. Clark, Lincoln Steffens and J. C. O'Laughlin, with a few others in the offing. Taft trusted to his smile. Wilson had John Lind, E. M. House, and in later days one newspaperman who frequently changed masters, whose latest group has been endeavoring to give him standing —with success unknown—with President Harding. But President Harding has no favorites; the entire press gallery he draws upon.

Mr. Harding represents for the first time in our history the newspaper profession as President of the United States. Editorially, the press foresaw a new day for the Fourth Estate as a result of it, especially after chafing so long under Wilsonian restrictions, some of which, in justice to President Wilson, were not his but gratuitous autocracy on the part of a political assistant.

Unfortunately, however, the wish did not father a fact. The majority of the administration leaders are not friendly to the press to the extent that they are willing to permit its Washington representatives to write freely, for or against. President Harding lauded reporters who gave friendly publicity to the abortive limitation of armament conference, but a few weeks afterward he was aroused, incensed and nettled because the newspapers printed Congressional proceedings in the course of which a Senator attacked a pet member of the administration. As if real news is not its own apologist—and as if Congressional debates were not news!

President Harding—this is fact as well as news—seems to have forgotten that in his Senatorial days he resented the "secrecy" surrounding administrative affairs of the Democratic administration. One may easily imagine what the occasionally emphatic publisher of the Marion *Star* would have said if President Wilson had ever scolded the Washington correspondents for criticizing him or his officials. Conversely, what would he have exclaimed had President Wilson resented the publication of some acrid aspersions uttered on the floor of the Senate, including a few of the Ohioan's own fluminations? This is not comparative criticism; it is fact. We are discussing neither administrations nor politics, but newspapers, their representatives, and their rights.

Secretary Mellon has the most natural disinclination for publicity and the newspaper men manage to leave him severely alone. Secretary Hoover is as silent as ever, personally, but releases reams of bulletins about foreign trade. Secretary Hughes (he concludes the group of important public sources of information) is exceedingly touchy about the press. His attitude is one of sufferance, despite his apparent cordiality. His conferences with the Washington correspondents may be calculated to make them feel important, for as to news they are worthless. If an item of news should appear —news about international relations—in any newspaper, whose tenor or inferences are not to the liking of the State Department, reporters bow their heads until nothing but the beflowered blue carpets will stare them in the face.

Thus far the squelching of the Washington correspondents may not seem apparent. To the journalistic profession has been done what no one has ever dreamed of doing to any other profession or trade—to equalize all its members so that, in effect, the worst shall be no better than the best, and because the best are few they are leveled with the worst.

Harding's Attitude Surprise

THAT President Wilson should have done that was unfortunate enough, but it was comprehensible, because he always had a middling-to-poor opinion of the press and was somewhat cynical about its importance and intelligence. But that President Harding should repeat the method is as unexpected as it is contradictory.

President Harding, like President Wilson, chided the newspaper correspondents for attempting to know too much. In theory they were both right. They were speaking to the mass—not to the individuals.

There are correspondents in Washington today who knew at the time more than President Wilson knew, and who kept pace with what he learned, so that, apart from the actual ability of Mr. Wilson to have access to the government's secrets, the odds at final accounting were in favor of the correspondents in question.

The same may be said of President Harding, and, collaterally, of his adjutants. What Mr. Harding did not know by actual contact and experience in Washington and foreign affairs when he marched down to Washington in 1914, but that half a dozen veteran correspondents knew, would fill an encyclopedia. What he learned in the Senate was not monopolized knowledge; writers worth their salt learned with him. What these, in turn, must have learned by travel, personal contact, digging and analysis, to say nothing of having talked with men of all breeds, creeds, and opinions, in their own habitats, as it were, exceeds anything that Mr. Harding as President and Mr. Hughes as Secretary of State could possibly learn in their official hermitage. Secondhand information from official representatives and observers—some of whom can hardly be bragged about—is comparable to first-hand information by good reporters as day is to night.

Of course, to make this statement so bluntly may not be very complimentary to Washington officials, but why disguise a fact? Unfortunately, even the correspondents have disguised it, in two ways; one, by submitting to the rules governing Washington reporting in executive circles—which is nothing but a routine and often futile formality—and the other by effacing themselves outright, silence meaning assent.

Scoop a Thing of the Past

TODAY, so far as freedom of writing goes, the Washington correspondents, taken as a job lot, are marked men. If they hesitated to admit it, or even denied it, parallel columns of their correspondence—today's and any of a decade or two ago—will settle all doubts. A further proof is to take a dozen average newspapers, each from a different city, say tomorrow's, and compare the Washington correspondence; it will vary just about as much as a dozen peas would. No such resemblance will mark more ancient correspondence by the same writers.

This because Washington has standardized news, and while it is free to all comers, so much as is available under permission, it has become a commodity in which the personal equation of correspondents who represent the public has been wholly obliterated by officials who prefer to represent themselves and their partisan interests.

The "beat" or "scoop" of ancient memory—which to a newspaper man is what the discovery of a new serum is to a chemist or an uncharted land to an explorer—is conspicuous by its absence. The "beat," which may be all news or may be an original way of presenting or interpreting a given item, could come but occasionally, yet its achievement is what gave the correspondent constantly increasing standing. No official some time back ever dreamed of questioning the one prerogative by which a newspaperman demonstrated that he "belonged," even when its publication might prove embarrassing or untimely. President Roosevelt, who made more news for the "boys" than any other

(Concluded on page 13)

The Stop-over City of the United States

By GEORGE H. DACY

The Lafayette Hotel, on fashionable Sixteenth street, is popular with visitors to Washington.

The Willard Hotel, just around the corner from the U. S. Treasury and within stone's throw of the White House, is one of the national capital's popular hotels.

If Sir Walter Raleigh could stop at the Washington hotel of his name, he would be pleased to find that it specializes in the courtesy for which that nobleman was famous.

The Shoreham Hotel is the exclusively fashionable and conservative hostelry of Washington. It is a headquarters for famous army and naval officers.

Wardman Park Inn, the largest hotel and apartment house in Washington. It is mammoth and moon-shaped—every room is an outside room.

The Powhatan Hotel, only two squares from the White House, can accommodate 600 guests and is a tourist center.

TO most of us the newspaper announcement that the National Shriners would hold their next convention in June, 1923, in Washington, did not suggest much other than to incite our desire to be on hand for the festivities and merrymaking. To the District of Columbia—that little tract of land 10 miles square which is denied the right of franchise and yet at this time is the international center of everything that is important—this potential event is epochal. It marks the crowning of the national capital as the convention center of the United States.

Other cities may raise huge convention funds to tempt this and that association to select it as the meeting place of their big annual "round-ups," but Washington as a convention center offers historical settings, beautiful environments and peace and contentment unmarred by the smoke, dirt, bustle and confusion of a manufacturing center. It is the nucleus of our national history. It is the one city that every American blessed with a grain of patriotism and love of country hopes some day to visit.

The big conclave of the Shriners will develop more hotel congestion and will more thoroughly test the capacities of our capital city as an entertaining host than have any of the most important inauguration celebrations. Even at this early date, many months before the Shriner congress is scheduled on the calendar, practically every available bed has been rented and every eating place has been warned to prepare for the reception of the largest crowd which ever thronged the streets and boulevards of the City of Presidents. It is probable that more than 300,000 visitors will be attracted to Washington for the mammoth convention. Automobile caravans to start at Pacific Coast cities and pick up other cars en route will probably include 10,000 machines by the time they reach Washington. Already, the leading railroads are making arrangements at the Union Station for the parking of more than 3,000 Pullman cars, which will be used as headquarters during convention week by various groups of visitors who have decided that the best plan is to procure board and lodging with the railroad company during their visitation to Washington. An idea of the importance of a Shriner's convention to a city may be had from the fact that the bank deposits in San Francisco increased exactly $22,000,000 during the week that 1922 Shriner's "get-together" party was held in that city.

It takes a city with a remarkable reserve of hotel accommodations to satisfy the demands of a host of visitors such as usually are part and parcel of national conventions. Were it not that Washingtonians have long been grooming their city as the convention center of the country, the District of Columbia would be under-hotelized and inadequate to accommodate a 65 per cent increase in its number of temporary residents overnight. However, with its 162 big and small, good and medium hotels which provide more than 15,000 rooms for the use of transients, with its many hundred boarding houses that always handle the hotel overflow, with the cities of Alexandria, Virginia, and Baltimore, Maryland, but short distances away, Washington is well equipped to accommodate large crowds. In fact, for many years, the District of Columbia has been accustomed to staging so many annual conventions that it would wear out an adding machine to compute the total. Suffice it to mention that during a certain two weeks of the current summer, 36 conventions were held in Washington. There is scarcely a week in the year—even during the unfavorable winter seasons—but that there are anywhere from two to 10 important conventions holding forth at the national capital. Recently, the convention of the United States Chamber of Commerce, which brought more than 4,000 visitors to Washington, has been important. A year or so ago, the Southern Baptists, 9,000 strong, held their annual conclave in the capital city. Just a little before that the American Bankers' Association filled Washington with guests from all parts of the country. The Daughters of the American Revolution, the League of American Pen Women, the Sons of the Confederacy and many other organizations annually convene within rifle range of the White House.

At present, there are more than 300 national associations and organizations that maintain official headquarters in Washington. This means that the majority of these institutions hold their yearly meetings in the heart of our most beautiful city. The research activities of the different government bureaus also attract many scientific and industrial conferences to the northern banks of the picturesque Potomac. It is conservative to estimate that more than 600 conventions are held each year in Washington. This rise in popularity of the city as a convention center and the fact that Washington surpasses all rivals as the most important stop-over city in the United States has led to the development of a peculiar condition in the number and management of the local hotels.

At this time, Washington probably holds more unique records as an unusual metropolis than any other city. Peculiarly enough, it now has more hotel space per thousand of population than any other city of its size in the world. During the war, the population of Washington increased by rapid jumps, just as a barometer rises and indicates the approach of stormy weather. Practically all available boarding house, apartment and hotel accommodations were ultimately utilized. Uncle Sam had to get busy and go into the hotel business himself to provide living facilities for the thousands of girl workers who rushed to the aid of the government.

Despite the many hotels in Washington previous to the war, adapted for housing the crowds of tourists and motorists who annually flock to the capital city, and despite the high cost of building, work on several new hotels was begun. These structures have since been completed and yet more are being built.

At least a score of very large apartment hotels are being built while plans are being contemplated to break ground for a couple more hotels. The recently completed Grace Dodge Hotel caters exclusively to girls and women. The population of Washington is 438,000 and is increasing. The restrictions against the establishment of manufacturing in the District of Columbia are all that oppose the boom development. However, to preserve Washington as the most beautiful city these bars against manufacturing and industry must remain.

Because you and I and most everyone of the 105,000,000 other Americans hope some time or other to visit Washington, because hundreds of thousands of foreigners have similar intentions, the number of hotels in Washington steadily increases and the hotel business, although different from that of other cities, is a modern Golconda which returns attractive revenues.

"Marry in Haste—and Repent at Leisure" Lax Laws Make U. S. Appear Decadent

Twelve Thousand Girls of 15 Years of Age Are Married; Legislation Provided for Marriage and Divorce as Varied as There Are States

By CARL SCHURZ LOWDEN

HALF of the first line above is a dead letter. There was a time when mortals that married in haste did "repent at leisure" if at all, but "them days is gone forever." Now they fly to the divorce court and get the binding tie broken forthwith. This whole miserable situation menaces the security of our social unit, the family. And the family, be it said here and now, certainly is the corner stone of our boasted civilization.

Is the United States already a decadent nation? This question may be seriously asked. Rome was more than four centuries dying; but Rome did not realize its fate, or that each year brought it ever nearer. Immorality, a wild disregard of the social contract, led to its slow but inevitable downfall.

And what of us? Whither are we tending? What will some historian, as yet unborn, record of us in other years? Perhaps he will write:

"Each of the 48 states had a marriage law of its own, but practically all of them were lax; easy marriage with easy divorce undermined the morals of the nation, and, therefore, it fell an easy victim of the conscienceless invader."

The future is a closed book to all of us; we can only guess at its contents and chapter headings. I do not wish to qualify as an alarmist. But what will our children and our children's children be doing 20 or 30 or 50 years hence? Let us hope that they will not be blaming us with the sin of omission or saying, "Of all sad words of tongue or pen the saddest are these, 'It might have been.'"

41,000 Girls of 16 Wed

NOW let's proceed to inquire into "Marry in haste." Latest figures reveal startling facts; they are such unless we have become too blasé to be startled. Twelve thousand girls living in our beloved and cherished America are wives at 15 years of age. Clearly they ought to be misses still; instead they are misfits with each legally entitled to write "Mrs." before her name at a time when she should be helping mother rather than being a mother. And what of the boys? Sixteen hundred of our youths, mere striplings of 15, are husbands and heads of families. Think of these facts. Ponder them well.

The foregoing facts are official. They were gathered by the Census Bureau, analyzed and given out by the Department of Commerce. Therefore they are absolutely authentic and irrefutable.

In the United States 41,000 girls of "sweet sixteen" are married; the number is constantly changing however, as during the same year more than 1,200 of them will obtain divorces with others meanwhile rushing into wedlock. Of 3,222 boys that became husbands at the tender age of 16, just 144 of them were divorced within a year afterward.

There are brides of 12 and bridegrooms of 14 years; for two states, Louisiana and Kentucky, permit such unions when the consent of the parent has been obtained. Seven other states have also recognized these ages. Seventeen of our commonwealths do not name a minimum age with the parents' consent given. New Hampshire specifies 13 and 14, with the lad having the higher limit. Kansas has fixed 12 and 15. South Carolina considers 14 and 18 adequate. The District of Columbia together with four states agree on 14 and 16 as marriageable ages.

Don't Have to Consult Parents

IF THE parents refuse their consent, setting sail upon the sea of matrimony may not be accomplished with the ease that would prevail if they approved. Maryland, New Hampshire and Tennessee show a liberality of a degree decidedly distressing to those persons who believe that restrictions should be imposed. In any and all of these states a maid of 16 is her own law and she may contract marriage without parental restraint; she needs to do nothing more than capture the male of the species. If she happens to be a Tennessee miss, she may take a lad of her own age; for the law says that matrimonially he is a man and may wed as he pleases without whispering a single word to "Pa" or "Ma" about his intentions. The would-be groom of Idaho, New Hampshire, North or South Carolina cannot act with the same freedom; he must wait until he has reached 18 before he slips from beneath the old parental wing.

A majority of the states permit a young man to use his own judgment after he becomes 21 years old and to marry at 18 if his father and mother are willing. That reads very well and is very well in so far as it goes. But there happens a loophole which qualifies as truly a "nigger in the woodpile." A full score of the states name the limits mentioned and then nullify them by failing to specify any fine or punishment for the licensing official who disregards the provision which requires parental consent. This is indeed a pretty spectacle of glaringly inexcusable laxness.

Undoubtedly a large proportion of early unions are necessary to legitimatize children. There will always be a certain percentage of such cases, but those that are not of this character certainly should not be permitted and those that are should be lessened in number from year to year.

"Many marriages," says Judge O. B. Ratcliff, of Indiana, "are partly due to the present tendency toward the eradication of bashfulness which is a providential safeguard for keeping the sexes separated until the right mating time. Shyness protects our boys and girls.

"Now Providence has kindly provided this bashful spirit during the growing period to assist the human race in the proper rearing of its young; if carefully cultivated rather than destroyed, it will bring about such protection. I most seriously criticize the practice among parents and among educators of letting boys and girls associate in their adolescent period to the extent that they are utterly devoid of the bashful feeling in each other's company. I am arguing that familiarity and the fondling of one sex by the other through dances, play parties and auto rides are evils that spell disaster."

Is it possible to marry without a license? It is if you reside in Alaska; also if you live in Georgia, Ohio or Maryland and an announcement has been made by means of bans. Licenses are required in all of the other states and territories. New York, New Jersey, Rhode Island, Arkansas and Ohio insist upon the appearance of both parties in person. New Mexico and California have laws that demand the appearance of both parties for an examination under oath, or the submission of affidavits in lieu of this requirement. The Oregon statute provides that the principals must undergo a physical examination before the license may be granted. New Hampshire and New Jersey have legislated against communicable diseases.

Let Feeble-minded Unite

SO FAR, so good; but the "half has not been told." Almost a score of our states let the feeble in mind unite and thereby propagate their kind to crowd our asylums and penitentiaries. The other states say that the feeble-minded shall not marry, but most of them undo the potential good by stipulating that the party or parties seeking the license may obtain it by testifying under oath that they are mentally capable. It thus becomes largely a matter of individual honesty. No corporation or private enterprise would countenance such acts in the conduct of its affairs. Why does the state?

Miscegenetic marriages, those between the races, are forbidden in slightly more than half of the states. Intermarriage of Negroes with whites is prohibited and punishable in 29 states; but there have been evasions. Indians and whites may not wed in Arizona, Oregon, North or South Carolina. Chinese and whites feel the stern arm of the law in Utah, California, Arizona, Oregon, Idaho and Mississippi. There can be no adequate prohibition of such nuptial contracts until our 48 "little principalities" and the District of Columbia all agree.

May paupers marry? You answer instinctively "No." That is easier said than done, however. Who can draw the line between poverty and prosperity, and who can know that marriage of one poor person to another will not tend toward an improvement of their financial condition? Four states have legislated against paupers; three refuse drunkards the right to wed.

Hasty marriages lead often to the divorce court. Ordinary common sense will tell the observing person that infatuation rather than true love causes the procurement of the license and the subsequent visit to the minister. An enforced delay would give the parties time to think before making the leap which is hazardous enough even with all possible precautions taken. New Jersey and Delaware prescribe an interval before the ceremony may occur while eight states slow the process of granting the license. Illinois and Montana will not permit divorcees to wed until one and two years respectively have elapsed after the legal separation. The movement for the giving of these interlocutory decrees seems to be gaining much impetus; the restriction may become comparatively general within the present decade.

Relatives are forbidden to marry in a majority of our commonwealths; yet in 27 states first cousins may take each other as man and wife, and in 21 the step-relatives may do likewise. These unions cause such a mix-up of relationships that an income tax expert would suffer a brain storm if he should endeavor to figure them out.

In some states a license shall not be issued if the woman does not reside in the county where the application is made, but clerks often wink at this regulation. They practice a little graft, said graft consisting of selling lithographed certificates bedecked with Cupids and gorgeous wedding wreaths. No one must buy; but the impression that they are required can be subtly conveyed, and often is. Now the money paid for these certificates goes into the pocket of the clerk; thus whenever he says "No" to a love-smitten pair he denies himself the chance of obtaining a neat profit. The legal license has the official certificate attached to it. There is no real need for any other, but for sentimental reasons the contracting parties like to possess one that they can keep, have it framed to hang on the wall of their home; the attached form must be returned to the clerk and entered into the county records after the ceremony has been performed. A law prohibiting the issuance of unauthorized blanks with their accompanying personal profit would go a long way toward the eradication of certain evasions now frequent.

Returns Not Required

EVERY state provides for the recording of its marriages by the filing of the official certificates. Some states insist upon their return within three days after the minister has pronounced the pair man and wife, but others take a lackadaisical attitude with two months specified as the limit. This divergence is bad enough in itself, but listen to this: failure to comply with the law goes utterly unpunished in 21 states. Can you expect it to be strictly observed there? It would be foolish to expect anything of the kind.

There is a certain phase of marriage that many of us do not like to discuss, but it is of such seriousness that it absolutely cannot be overlooked. Dr. Howard A. Johnson, president of the Chicago Church Federation, declares: "The fight that is being made against the appalling increase of communicable diseases is a matter of infinite importance." Churches are officially taking cognizance of the deplorable situation. I might quote the resolution of the Episcopalians. Passed at a conference held in the autumn of 1922, it reads:

"Resolved, That the clergy of the round table recommend to all the clergy of the diocese of Chicago that every person seeking to be married be requested to present a certificate of health from a reputable physician that he or she is free from social or other types of communicable disease."

Figures Are Appalling

"WE ARE apt to shut our eyes to conditions and think they are not as bad as they really are," says Dr. Herman Bundensen, Chicago's health commissioner. "The statistics of social disease of the country are absolutely appalling."

"Inadequacy of our 48 states' contradictory marriage and divorce laws," declared the General Federation of Women's Clubs in a resolution approved at its last biennial session, "threatens the stability of our national family life."

We deprecate the prevalence of divorce, but it is the result rather than the cause of our far-reaching social problem. Seek the cause in bad marriages; there you will find it. Eliminate the bad marriages, give to matrimony a greater degree of substantiality and the divorce evil will very largely disappear.

The ill-considered, hasty, leap-before-looking marriages frequently lead straight to divorce which is the official wrecker of homes, creator of stepchildren and filler of orphan asylums. Approximately 12 per cent of all connubial adventures end in that sad fashion sooner or later. And what happens to the 88? An honest facing of the facts will reveal that probably a majority of these are characterized by wrangling and various evidences of mismating.

It is a serious matter, this growing disintegration of our family life. We should do something, do it not later than the present year, to prevent such a truly woeful catastrophe.

In a Bolshevik-controlled City of France

Just a Bit of "Neglected Truth" That Came to Us in a Letter

EDITOR'S NOTE—*This extract from the letter of a French woman gives more insight into the state of affairs in France than many dispatches do. It is written from a city in Southern France.*

Newspaper readers know next to nothing of what transpires in Europe. What officials SAY, what governments PROPOSE, is all we are told. But what actually is the condition, Americans do not know. Americans are today perhaps the most blinded people in the world, due to the veils of deliberate deception drawn over their eyes. People of long sojourn in Europe arrive on our shores amazed at our ignorance. Italy broke down industrially eight years ago. France broke down industrially five years ago. Great Britain has trembled on the verge of industrial collapse for four years. Germany, alone of all the nations, has never had one hour of industrial collapse. Yet Europeans, visiting America, discover that we talk only of the need of Germany, the distress of Germany, the sad condition of Germany. Germany in all her history never saw as much suffering as Italy and Switzerland have endured the last year.

By letters, by personal observation, by private uncensored reports, the truth gradually comes out. This very interesting letter contains more illumination than the press or the special propagandists give.

THINGS have come to a pretty pass. Here I cannot get Fabre's books, for the library is kept closed by Bolshevik orders. You see, this town is controlled by the ultra-liberal government.

Those in America who believe France is imperialistic would change their minds if they could spend some time in this city. I take it as an example because I thoroughly know it, but there are hundreds and hundreds of cities and villages just like this one scattered all over France; big cities, too, as Limoges, Lyon.

It began about four years ago with a strike at the railroad shop, which is one of the most important in France. The strike with all its excitement, syndicate meetings, violent proclamations, parades downtown preceded by red banners, lasted one month. If the laborers wanted a vacation, they certainly got it, and are still having it.

At that time came the election period. Mayor and municipal council had to be chosen and the effervescence of the hour caused them to be chosen by "red" among "red." "Red" was the mayor and "red" were members of the municipal council; "red" they still are.

After the election the first thing done by the new committee was to turn over to the strikers and their families an immense building, which had been a Catholic seminary, whence the priests-to-be were expelled at the time of the separation of Church and State in France. At that time the seminary had been turned into an artillery barracks, and during the war it served as a hospital. Its third transformation made it a Phalanstere." As in Owen's and Fourier's dreams, it came to be a house where people lived according to communists' ideas, and communists' slogan: "To every one according to one's needs." They ate the same soup at the same hour and slept in the same house. Rooms were divided according to the number of children in the family. And outside the gate an imposing red flag was waving over the iron fence.

This was a little too much, and the prefect who superintends the department applied the law, "None except the tricolor flag can be hoisted on public buildings." The next morning the flag had disappeared, but hung along the fence was a long wide strip of red cloth with two infinitesimally small white letters, M.P.; not military police, but Maison du Peuple—House of the People—and this no law could take down.

Today strikers and families are still living in the Maison du Peuple, although it is far from being Maison de la Paix, House of Peace. French character does not get along very well in the "heaping up" sort of living. It was not long before discussions and fights came, a-splitting such ideal harmony. But of course as work is still scarce and houses without rent still more scarce, people stay in the Maison du Peuple, though reluctantly.

Work is scarce, but one must admit the mayor's ingenuity in the matter of finding work for his faithful electors. Thousands of odd jobs were created around the town. Each tree on the promenade has its private gardener, each lawn a skillful "raker." The system of city lighting has been so arranged that it requires a man to switch on the electricity at each street corner. Every single night one may see the "electrician" go by, riding his bicycle, with a ladder across his back. He stops every 50 yards, puts his ladder against the wall, and up he goes, as dignified as an astronomer who could make the sun rise by pressing a "button." Why worry? The "dirty bourgeois" are made to pay taxes.

The mayor is active, he is important! Because he is in correspondence with Trotsky, and even visits him, he is "somebody"! By his orders, there is no illumination nor hoisting of flags on the Fourth and the Fourteenth of July, nor on Armistice Day. New streets take the names of famous Communists, Socialists, Bolsheviks, and whenever there is a "red" parade, the mayor leads it with the red banner.

The public library is closed, for the librarian named by the municipal council was quite incompetent to hold such a position. The prefect pronounced his veto, once more applying the law, "Librarians for Public Libraries must be graduates from the School of Chartes" (a department in the faculty of letters, Paris). As the municipal council refuses to vote more than 5,000 francs a year for the librarian's salary, and as no scholar from the School of Chartes will accept such ridiculous pay, the library will remain closed "vitam eternam."

But, yes, of course, there is at least one library open. That is the Communist Library. There you may read Marx, Roppoport, Trotsky, and Lenin's lucubrations to your heart's content. There boys from 13 to 18 are initiated to the intricacies of the "War between Classes," dear to their conscientious leaders. Didn't I hear one of those young "reds," who was carrying a "white" flag in a strikers' parade, shout on his way, "I'll paint it red in the 'bourgeois' blood!" The boy was a 14-year-old apprentice in the shop.

The other night I went to the movies. Really I should have liked very much to have had the presence of some Americans there, for they would have witnessed two things which are in America seen under a rather false light: the interest the French people take in sports, and the ideas of this same French people about imperialism, militarism.

The room was full, and it was neither Saturday nor Sunday. Should you know the slight taste the French have for motion pictures, that would surprise you. On Saturday or Sunday nights, the mass of laborers go to the movies for a change, after a week of hard work. Few go there by taste, and during the week the show is given before a rarefied audience. Yes, to have been twice to the movies in one month, one is taken for "terribly Americanized," you know.

But that night the room was full because the fight, Carpentier-Battling Siki, was on the program. Yes, people don't have time for sports, nor the money sports require, but they wax enthusiastic about them and "live" with sports, although they don't practice them. While the white champion and the colored giant were fighting, on the screen, shouts and exclamations sprang from the audience as if they could change the unavoidable conclusion of the match, that is, Battling Siki's victory. And when the end came, and with it the knocking out of Carpentier, it must be admitted that cheers and sympathy were not for the victor.

The other play on the program was an American film. I don't remember its title, but it treated of the United States' entry into the war. Doughboys marching along Broadway got some applause, but, as the theme unfolded, a cold silence reigned over the theater. An American manufacturer turns his factory over to the government for the making of shells. Then he wants his young brother to enlist and during the dramatic discussion he has with their own old mother, the audience got terribly excited. Did our French audience want the young brother to go? No, indeed, they cursed the manufacturer: "Blood-thirsty murderer! Let him remain with his mother, you wretch!" Other imprecations were untranslatable. I began to feel quite uneasy, for the excitement was growing every minute, and it reached its paroxysm in a tremendous tempest of fierce shouting when, in the play, a foreman of the factory, of German extraction, went to the director to declare that, being German, he couldn't work any longer on the manufacture of shells destined to kill his own brothers. As the director tried to persuade him to the contrary, the audience yelled hundreds of: "The German is right! Down with war! We don't want to be butchered again!" so violently that part of the spectators went out, and the curtain went down leaving the play unended.

Washington's Deathblow to Newspapermen

Concluded from page 12

President before or after him, often learned of events of official interest to him through the newspapers, and he was never above admitting that the periodical was the place for news, old and new.

Thus by a slow and somewhat hazy evolution the corps of Washington correspondents has lost out. One of the habitual distinctions attaching to it is that it represents the most brilliant and successful representatives of newspaperdom, but that distinction, not even applicable in its heyday, is a burlesque.

From this it will be seen that willingly or not the Washington correspondent, professionally, must be a good boy and follow the rules that have chained him to a task wholly devoid of thrills and expectations. His routine is as fixed as the earth's orbit. White House, State Department, Congressmen from his own state, Capitol—these are his chief daily ports of call; then the subordinate news gathering. Foreign visitors and other events occasionally break the monotony.

One shudders to think what would happen to him—and perhaps the correspondent has shuddered himself into effacement—if he disregarded the mandates that now fetter him. Yet it is pleasurable to recall to mind the few colorful breaks between high officials and correspondents a few years ago, in which a newspaper, having implicit faith in its representative, backed him to the limit.

Naturally, a little occurrence like the one that led President Wilson to cancel the "conferences"—this was in 1914—because of a correspondent's belief that those conferences were to be thorough, was enough to take the starch out of his colleagues. They have lost that starch, and in confessing this the writer does it with the realization and understanding that he is not questioning their attitude but only championing the cause of the press and, ultimately, of the reader, who seems to have been lost in the shuffle.

The many reporters who a few years ago wrote not always complimentarily about some of the men now in office, upon whom they wait, have since hastened to remedy their alleged fault, with the unescapable result that such fawning lost them their one advantage. Silhouettes and personalia are the most difficult branch of reporting, especially when it is done impartially, truthfully, officially. Moral: do not appraise unless you know your ground; having appraised stand by.

Take the case of Samuel G. Blythe. He has changed some of his piquant biographies, but he has never reversed himself. What he has done has been to discover some hitherto concealed and occasionally add some imaginary merit, but the old work has not been tampered with.

Yet "Sam" has found Washington anything but a bed of roses, lately. Because some of his recent writings have not been to the liking of those concerned, officials say that "he is getting old," or that "he has hallucinations." What worries them is that he has the advantage over them and is not relinquishing it. Yet he has been unusually moderate and temperate, and has not rushed into print to commercialize some very valuable information under his hat.

The prevailing idea by some officials, notably President Harding's, is to have a public-spirited press, whatever that means, but which is calculated to magnify pretty and pleasant incidents and shrink or even ignore what is otherwise. This, of course, is not journalism.

Frankly, what is needed in Washington today, for the sake of millions of readers, is the realization that the chief reporters—all the others are unnecessary—have rights and duties that no official can afford to disregard. It is the realization, too, that fact-gathering is a dignified task that must yield to none.

It is time for fewer loving cups and gold scissors, which butter no parsnips for those who make the presentation.

Fascism as a New Cure for Demagogy

Concluded from page 2

for idle labor and to aid the nation in making up for the years lost during the war;

Dissolution of the General Labor Association, organized in 1850, ostensibly for mutual benefit, but in reality political, which of late had assumed a revolutionary anti-state attitude;

The standing request that all workers not satisfied with the conditions shall resign and not strike, and that strikers will have nothing to fear "so long as their activities do not endanger the welfare of their communities and the nation';

The open decision of the Mussolini government that "Capital cannot prosper without Labor and Labor cannot thrive without Capital; no privileges for the first and no privileges for the second, but justice for all"; that all honest debts must be "debts of honor," that "contracts and property are inviolable";

A decision to augment the production of grain and to curtail the production of wine, which is excessive;

The reduction of duties upon imported cereals and flours, and the plan to give Italy a customs system like England's, which is not far removed from free trade;

No secret or unilateral diplomatic agreements, and a policy of "all cards on the table" in international affairs;

The threat of censorship against the press, or that section of the press which has been using, or has been made the organ of, propaganda which is dangerous to the nation, with special reference to inspired articles traced to semi-financial sources, which intend to speculate upon losses caused by rumors, with the probability—as was the case during the Ruhr occupation by France—of severe penalties for exchange speculators;

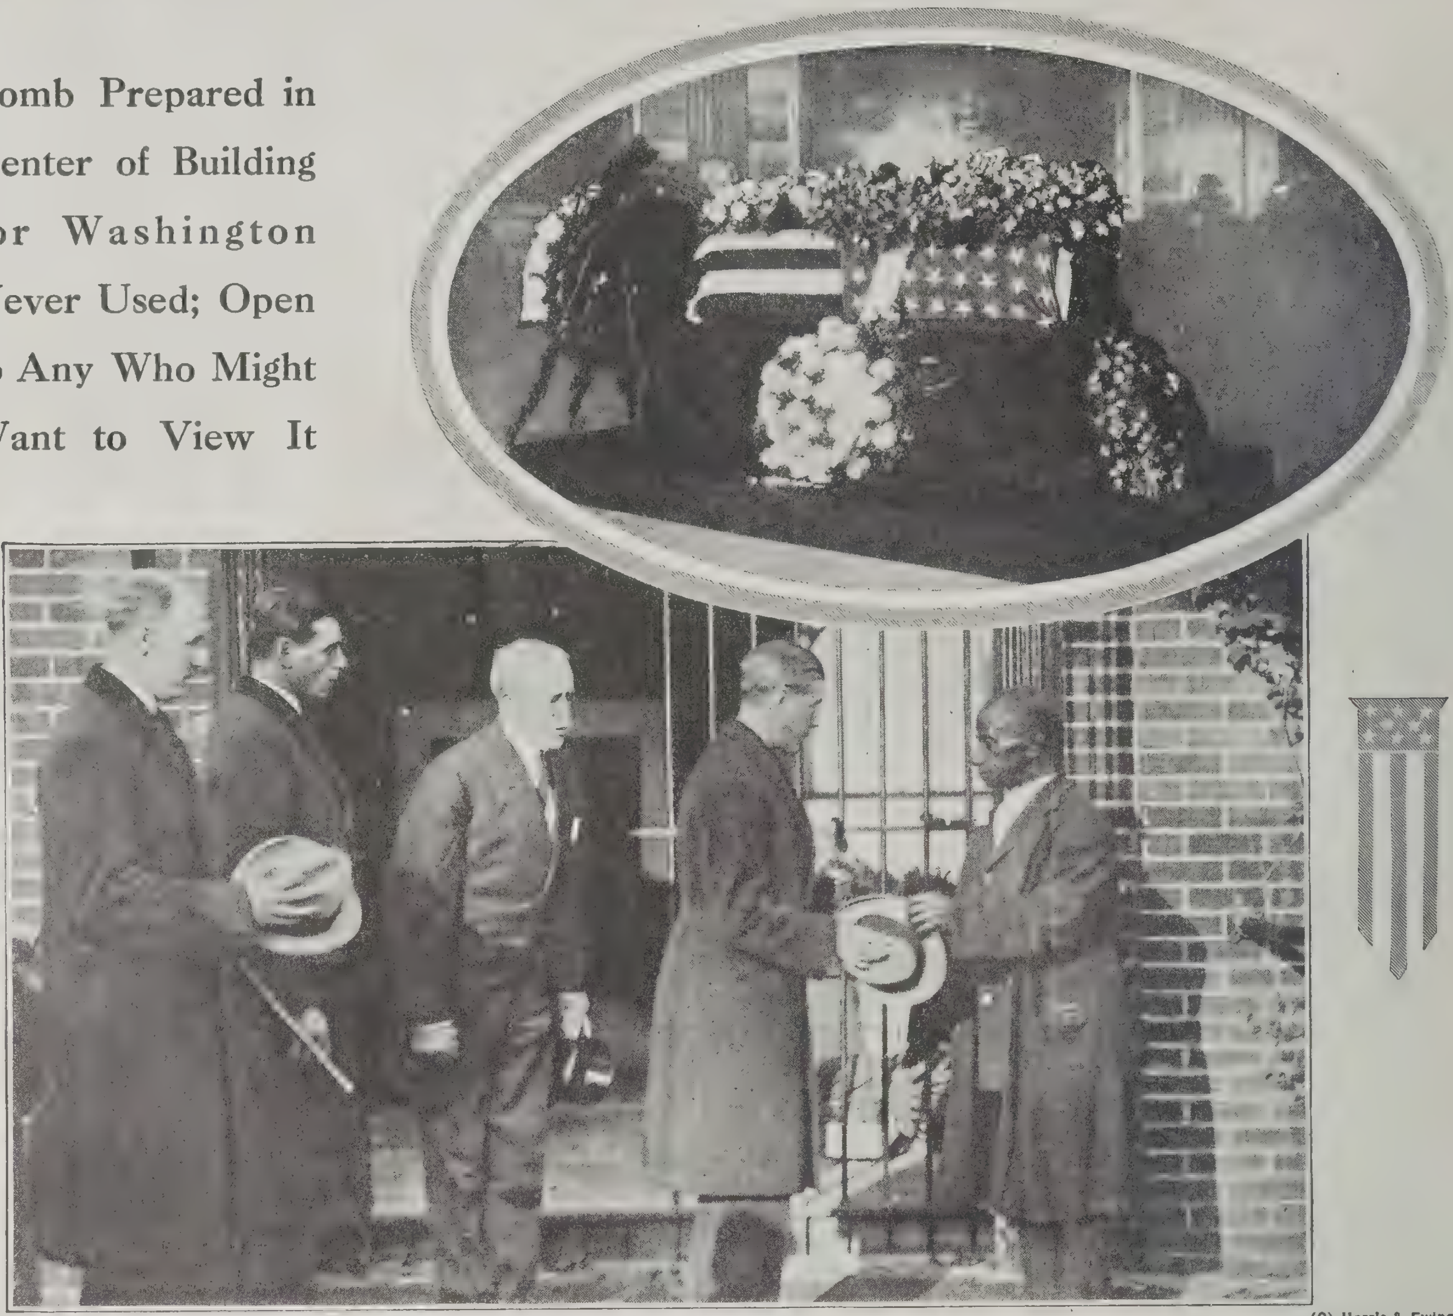
The wish—spoken in jest but with the evident intention that it should be heeded—that the ministers and other public officials shall abandon the custom of uniting as a reception committee every time the premier returns from out of the city, which Signor Mussolini considers a grave loss of time.

These are the more important changes ordered or about to be ordered by the Fascist Government in Italy. They are the changes which have changed the Italian spirit from one of hopelessness to one of self-help. Self-help is the doctrine which Mussolini wishes to propagate.

There may not be very much in all of the foregoing which is very promising to privileged classes, foreign or Italian, who have hitherto known the code which would open Italy's doors irrespective of the nation's interests. If Fascism can stand firm against speculators—who are not capitalists although they use this name; and against labor kings—who have nothing in common with the workingman; and against politicians and the voting classes, it will be a proof that the existing subjection of statesmanship, such as it is, the world over, has been imaginary and that there is no excuse for its continuation.

Why Father of Country Was Not Buried in Capitol

Tomb Prepared in Center of Building for Washington Never Used; Open to Any Who Might Want to View It



(C) Harris & Ewing

Oval—The bier of the Unknown Soldier was in the rotunda of the Capitol. In the other photograph the Prince of Wales is shown visiting Washington's resting place at Mount Vernon.

WHY was George Washington never buried in the national Capitol? It is easier to ask the question than to answer it. But, in the question lies a bit of interesting American history about which but few Americans know anything. Annually, thousands upon thousands of sightseers visit Washington and go through the vast corridors of the Capitol and stand in the center of the huge rotunda and gaze upward toward the dome; few, however, are aware that under that rotunda is a tomb that was prepared for the immortal George Washington.

They visit the Capitol to see, and they have pointed out to them, the frieze which circles the walls of the rotunda about 75 feet from the floor; they see the four historical paintings by John Trumbull and the numerous other famous paintings, they look upon the massive bronze doors, they see the memorials to the nation's great in impressive Statuary Hall, they visit the rooms of the President, the Vice-President and the Speaker, the Senate chamber and that of the House of Representatives, but few ever know that a tomb for Washington had been prepared in the Capitol building. They see the beautiful and the interesting and pass up one of the most interesting, sentimental and historic spots in Washington.

The tomb prepared for Washington lies directly under the dome of the Capitol; it is below the crypt, which is on the first-floor level. While the entrance to the tomb remains locked, any visitor who desires to do so can see by simply making known his wants at the office of the architect of the Capitol. When the doors are unlocked and you enter the circular chamber, broken by concrete supports, somehow you feel thankful that the body of Washington was not placed there. It does not seem to be an appropriate place for it. Adding to the dismal appearance of this vault, this tomb, is a scattering accumulation of old furniture, papers, dust—because the room has been used as a kind of a storage room.

In the center of this chamber, under the arching concrete, cut off by heavy iron grate doors is the tomb that was prepared for Washington. But the body of the immortal Father of our Country is not in that tomb; there is a simple black bier and on this simple bier first rested in state, in the rotunda of the Capitol, the body of the martyred Lincoln. Since that time on its black surface have rested the remains of Thaddeus Stevens, President Garfield, General John A. Logan, Chief Justice Chase, Charles Sumner, President McKinley, Admiral Dewey, and more recently, that of the Unknown Soldier. What a list of illustrious dead—but, it has never supported the remains of George Washington and probably never will.

On first impression one would naturally think that the appropriate and logical place for the remains of Washington would be in the capital of the country which he fathered, in the city he took so much pride in having properly surveyed and mapped out, which bears his name. A great many persons on first and last impression have thought so. The majority of those who know anything about the history of the discussion as to his burial place think that he was not buried in Washington because he expressed in his will his desire to be buried at Mount Vernon. That doubtless had a great deal of influence, but was by no means the sole consideration in determining his final resting place.

Just a few days before his death, Washington remarked that the old family vault was in bad condition and that a new one would have to be built, also suggesting that other things should be put aside and the vault attended to at once, as he would soon need it himself. In his will was this provision:

> *"The family vault at Mount Vernon requiring repairs, and being improperly situated besides, I desire that a new one of brick, and upon a larger scale, may be built at the foot of what is commonly called the Vineyard Inclosure—in which my remains, with those of my deceased relatives (now in the old vault) and such others of my family as may CHUSE to be entombed there, may be deposited. And it is my express desire that my corpse may be interred in a private manner, without parade or fueral oration."*

Undoubtedly, Washington expressed his desire in this provision of his will, but, it is not at all unlikely that he foresaw that there would be some popular demand as to the disposition of his body and as to the ceremonies attending his death. This may have been responsible for the language he used in his will when he said that it was his "express desire" that his corpse "be interred in a private manner, without parade or funeral oration," and that he "desired" that the new vault "may be built" so that his remains "may be deposited" therein. There was no express direction, but simply an expression of preference in reference to funeral parade and oration.

At any rate, his preference was not long respected. Washington died December 14, 1799, and was buried at Mount Vernon on December 18. On December 23, 1799, Congress passed the following resolution:

"Resolved, by the Senate and House of Representatives of the United States of America in Congress assembled, That a marble monument be erected by the United States in the Capitol at the city of Washington; and that the family of General Washington be requested to permit his body to be deposited under it; and that the monument be so designed as to commemorate the great events of his military and political life.

"And be it further Resolved, That there be a funeral procession from Congress Hall to the German Lutheran church, in honor of the memory of General George Washington, on Thursday, the 26th instant; and that an oration be prepared at the request of Congress, to be delivered before both Houses on that day; and that the president of the Senate and Speaker of the House of Representatives be desired to request one of the members of Congress to prepare and deliver the same.

"And be it further Resolved, That it be recommended to the people of the United States to wear crepe on the left arm as mourning for 30 days.

"And be it further Resolved, That the President of the United States be requested to direct

a copy of these resolutions to be transmitted to Mrs. Washington, assuring her of the profound respect Congress will ever bear to her person and character, of their condolence on the late afflicting dispensation of Providence, and entreating her assent to the interment of the remains of General George Washington in the manner expressed in the first resolution.

"*And be it further Resolved,* That the President of the United States be requested to issue a proclamation, notifying the people throughout the United States the recommendation contained in the third resolution."

While technically complying with the desire of Washington as expressed in his will, yet, within a few days, on December 26, pursuant to a resolution of Congress a great parade took place and a funeral oration was delivered before a joint session. This is said, not in criticism or suggesting that such was not fitting, but rather to show that the spirit of Washington's expressed desire was not complied with, which, to a degree, should have lessened the strength of that argument in the following discussions.

It was unnecessary to suggest to the American people that they should wear crepe on their arms for 30 days, for truly, "the death of Washington made every dwelling place in the land a house of mourning."

Through his secretary, President Adams conveyed to Mrs. Martha Washington a copy of the resolutions requesting her permission for the removal of the remains of her illustrious husband. The original letter which Mrs. Washington wrote in reply has recently come into the possession of the Manuscript Division of the Congressional Library. The letter reveals the high character and quality of the first "First Lady of the Land," as well worthy of the beloved name she bore. The letter reads:

Mount Vernon,
Dec. 31, 1799.

Sir:

While I feel, with keenest anguish, the late dispensation of Divine Providence, I cannot be insensible to the mournful tributes of respect and veneration which are paid to the memory of my dear deceased husband; and as his best services and most anxious wishes were always devoted to the welfare and happiness of his country, to know that they were truly appreciated and gratefully remembered, affords no inconsiderable consolation.

Taught by that great example which I have so long had before me never to oppose my private wishes to the public will, I must consent to the request made by Congress, which you have had the goodness to transmit to me; and, in doing this, I need not, I cannot say, what a sacrifice of individual feeling I make to a sense of public duty.

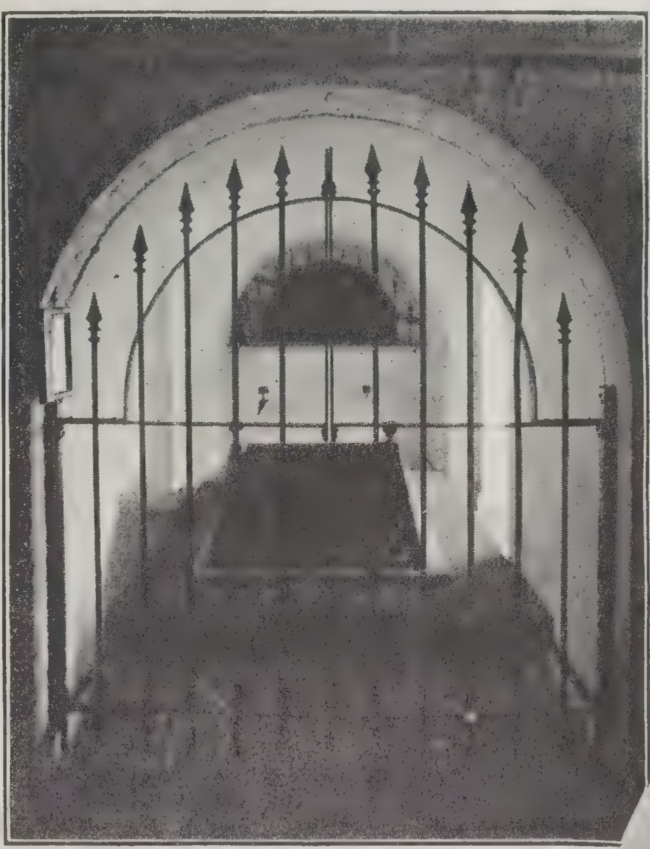
With grateful acknowledgments, and unfeigned thanks for the personal respect and evidences of condolence expressed by Congress and yourself,

I remain, very respectfully, Sir,
Your most obedient humble servant,
MARTHA WASHINGTON.

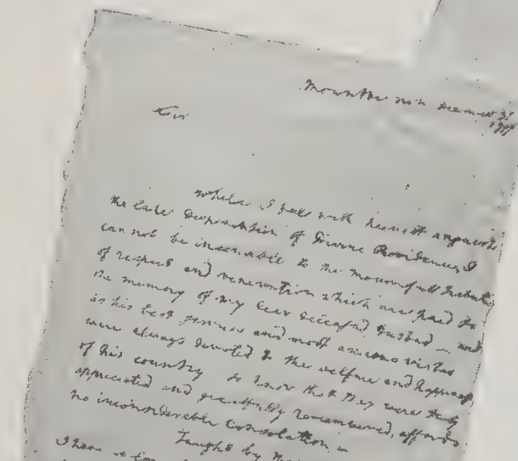
On the 8th day of January, 1800, President John Adams transmitted this letter to Congress in a message in which he, in part, said: "As the sentiments of that virtuous lady, not less beloved by this nation than she is at present greatly afflicted, can never be so well expressed as in her own words, I transmit to Congress her original letter. It would be an attempt of too much delicacy to make any comments upon it; but there can be no doubt that the nation at large, as well as all the branches of the government, will be highly gratified by any arrangement which may diminish the sacrifice she makes of her individual feelings."

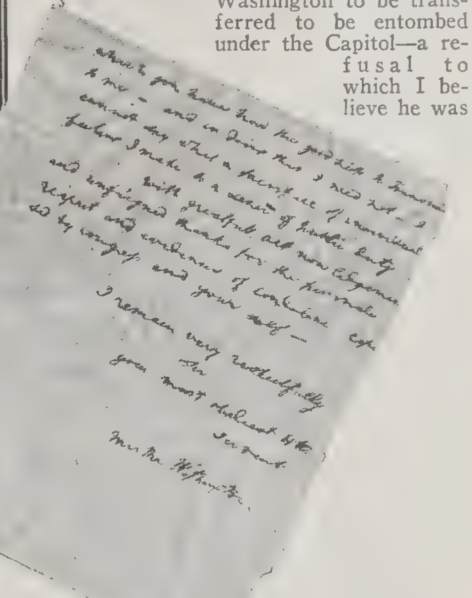
This left the matter up to Congress. The necessary consent had been obtained for the removal of the body, but there was doubt among some as to the propriety of so doing, and a still greater difficulty arose, that of deciding as to the nature of the monument or memorial, and the burial place.

May 8, 1800, Henry Lee made a report which was read and referred to a committee of the whole House. This report brought up the general discussion. The report recommended an appropriation of $100,000, and that an equestrian statue, which had been authorized by Congress in 1783, be completed, and that a marble monument be erected in the Capitol at the city of Washington. Various amendments were offered, but no definite decision could be reached. Through the succeeding Congresses various resolutions were offered, and various plans suggested, the matter dragging along indefinitely until 1832.



The tomb prepared for Gen. Washington in the Capitol.





The letter Martha Washington wrote to President Adams.

In that year the state of Virginia interposed by passing a resolution against the removal of the body from Virginia soil. Mrs. Washington had died in the meantime, and in the midst of the agitation for the removal, George W. P. Custis wrote a letter to the chairman of the committee in which he said that "Mrs. Washington yielded to the request of the government only in the firm and fond belief that, upon her decease, her remains would be permitted to rest by the side of those of her beloved husband," and that the first President Adams, through correspondence with Mr. Lear, had given Mrs. Washington to understand that the "government could do no other than comply with her just and honored expectations." This gave a new angle to the situation and it was necessary to modify the plans so as to consider both bodies. John Quincy Adams could not "imagine that there should be any question among those who incline to perform the promise of Congress at all, in what manner they ought to perform it. The request of Congress was not that *one-half* of General Washington's remains should be transferred to the Capitol." Lawrence Lewis intimated his objection to a separation of the bodies and wrote George W. P. Custis that "I think this committee ought to be informed that the family of Washington will not consent to a separation of the bodies."

It was, therefore, decided to remove both bodies. This made it necessary to obtain the consent of John A. Washington, then custodian of Mount Vernon, and of George W. P. Custis. The matter was taken up with them and Custis gave his consent, but in a letter dated February 15, 1832, John Washington refused. The letter read as follows:

Mount Vernon, February 15, 1832.

To the Hon. The President of the Senate,
And the Speaker of the House of Representatives of the United States.

Gentlemen:

I have to acknowledge the receipt of your letter, and the resolutions of Congress to carry into complete effect that which was adopted in December, 1799, for the removal of the remains of General Washington to the seat of government.

I have received with profound sensibility this expression of the desire of Congress, representing the whole nation, to have the custody and care of the remains of my revered relative; and the struggle which it has produced in my mind between a sense of duty to the highest authorities of my country and private feelings, has been greatly embarrassing. But when I recollect that his will, in respect to the disposition of his remains, has been recently carried into full effect, and that they now repose in perfect tranquillity surrounded by those of other endeared members of the family, I hope Congress will do justice to the motives which seem to me to require that I should not consent to their separation.

I pray you, gentlemen, to communicate these sentiments and feelings to Congress, with the grateful acknowledgments of the whole of the relatives of my grand-uncle for the distinguished honor which was intended to his memory, and to accept for yourselves assurances of my gratitude and esteem.

JOHN A. WASHINGTON.

February 22, 1832, a week later, the centennial birthday of Washington, John Quincy Adams wrote in his diary:

"The solemnities intended for this day at this place lost all their interest for me by the refusal of John A. Washington to permit the remains of George Washington to be transferred to be entombed under the Capitol—a refusal to which I believe he was not competent, and into the real operative motives to which I wish not to inquire."

Adams considered that the question was settled upon the refusal of John A. Washington. It has been reported that John A. Washington's refusal was purely on a selfish basis, as he was then the proprietor of Mount Vernon, and the removal of Washington's remains would have seriously affected the value of that place.

This seems to have settled, for all time, the question of the removal of Washington's body. Out of the original resolution, passed right after his death, grew the Washington Monument—for a while carried on by a national society, but finally completed by an appropriation of Congress.

But the settlement of the question as to the removal of the remains of Washington left open another question that has been much agitated since that time, and that is, who is to control Mount Vernon? There has been a considerable movement to get Congress to take over the property and make of it a great national shrine. But, after all is said, it is probably best that it be left as it is, unless Congress is willing to make sufficient appropriations to maintain it in a dignified manner after taking it over.

Mount Vernon is maintained in the simple and dignified manner that prevailed in Washington's day. Arrangements of house and grounds are as exact historically as it is possible to make them, and the quiet, restful spirit that pervades the place provides imagination and memory with a perfect setting for characters and scenes of colonial days.

BRIEFLY TOLD

Chinese, and other Oriental peoples, have lower blood pressure than the people of western nations, according to a writer in a prominent medical journal.

A model type farmhouse consisting of eight rooms and all modern city conveniences—intended to keep the young folks on the farm—has been built at the South Dakota Agricultural College at a cost of $5 000. Its most important feature consists of an electric light system generated by a gasoline engine, contributing to the operation of a vacuum sweeper, a cream separator, a churn, a washing machine, floor lamps, flatirons and other electric contrivances. The house contains large, comfortable rooms, summer kitchen with sink and drains, septic tank for sewage disposal, bathroom, furnace and laundry.

More than 3 300 persons were killed by wild animals in India during the past year.

A new form of life belt which supports the head of the wearer clear of the water is a great improvement over the old form of belt. Women of hysterical tendencies and old people sometimes collapse the minute they find themselves in the water. In this case the head falls forward or backward, the mouth is opened, and they drown at once. The new type of belt would prevent their drowning while unconscious.

Chinese stores and restaurants have become common in every street of Tokyo. They were rare a few years ago.

The swastika symbol, according to a writer in the *Journal* of the Asiatic Society, Bengal, is a modification of the mode of expressing the ancient Hindu syllable Om, which is used in religious rites. The earliest example known is on a spindle whorl from the third city of Troy, about 1800 B. C. It has been found in the ancient Swiss lake dwellings, in Japan, Korea, China, Italy, France, Germany, Russia, Great Britain and in the mounds of North America and South America.

The site of ancient Carthage, destroyed by the Romans, is in the hands of speculators and lots are being sold. The hills surrounding the ancient site are being slowly covered with residential villas.

Deterioration of cement stored in bulk is less than that stored in bags, owing to the smaller area exposed.

Although she had killed an elephant and a lion and faced the perils of the African jungles for eight months, a young woman, a member of the staff of the Museum of Natural History in New York, fainted from stage fright while addressing an audience in New York City.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Ur of the Chaldees, the home of the Patriarch Abraham, is to be explored by archeologists down through the dust of centuries to the earliest records. The work will be undertaken by experts of the University of Pennsylvania Museum and of the British Museum. No systematic digging has been done at Ur, but great libraries of cuneiform texts have been gathered at the two museums from material picked up near Ur by passing explorers and Arabs.

The Swiss Government, it is understood, is undertaking to assist in transporting 1,000 Swiss farmers to Canada, provided the Canadian Government can guarantee them employment for one year. The proposition is being considered by the Canadian Department of Immigration.

The American Society for the Prevention of Cruelty to Animals at Madison avenue and Twenty-sixth street, New York City, is offering a cash prize of $10,000 for a device which will render wholly unconscious all sheep, cattle and swine to be slaughtered, before they are jerked into the air or bled. It must be a mechanically operated invention, safe, sure, rapid and economical.

The president of Harvard University, A. Lawrence Lowell, said in his annual report: "The aim of the American college should be, not to give its students the technical training and tools of their future occupation, but rather to fit them to be citizens to develop those qualities that lead to the better life, both for themselves and for the community." The report made no reference to requirements for admission to Harvard. He urged students to enter colleges at an earlier age.

The most powerful radio plant operated by the Marconi Company is to be built in Vancouver, British Columbia. This plant will give direct service to England and Australia.

The Farmers' Co-operative Creamery, of Payette, Idaho, not only paid all expenses and wiped out its debt, but in addition paid its farmer patrons a dividend on last year's business amounting to $11,428. The creamery pays the farmers nearly 20 per cent more for butter fat than most of the Idaho farmers receive. It also distributed a five per cent bonus to all employes except the manager.

A biologist of the Vienna University has succeeded in transplanting heads from one insect to another and making them grow on the new body without fatal effects. Our black water bugs thrive and eat with as much gusto after exchanging heads as before.

Cactus is fed to cattle after the spines have been removed by burning, in certain sections of the Southwest.

Electric railways in many sections of the country are turning to the motor bus as an economical means for extending their service and better serving the public. They use the buses for use as feeder lines and experiments have proved successful. A commuter may now step from his door into a waiting motor bus and be taken to the nearest transfer point on the electric line. It is hoped this will relieve the congested housing conditions of the cities.

The new edition of the French Academy dictionary, which was begun in 1878, is now advanced as far as the letter J. At this rate the work will be completed in 1993.

Planters of the Tulare Lake, California, district are planting their grain from airplane. The theory is that if the grain is dropped from a distance of 100 feet it will automatically bury itself sufficiently for sprouting. It is costing about $1 an acre by the new method, compared to $1.50 an acre as previously planted.

Montreal is the fifth largest city in North America.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

By ROBERT MORGAN

The Electronic Theory—As Devised and Stated by Dr. Albert Abrams.

ELECTRONS and not cells are the units of the body. Electrons are charges of electricity and the basis of the material universe, including man. Electrons have invariably uniform vibrations, and it is only in the rate of vibrations that we can distinguish one object from another object. * * * * During the revolutions of electrons, thousands of billions of times per second, their vibrations (Radiations) escape. Many are perceived as light, heat, electricity, and so on, but most of them are unrecognized, because they have thus far eluded all scientific instruments.

Vibrations can destroy disease. Every object has a natural period of vibration. If one approaches an object with a source of vibration of the same vibratory rate as itself, the object will be set in vibration. This forced vibration of the object may attain such a magnitude as to fracture and utterly destroy it. Caruso could take a wine glass and determine its tone (vibratory rate) by tapping it. Then, by singing that tone in the glass would shatter it. This is exactly what happens when you impose on a disease its own vibratory rate by the oscilloclast.—From Abrams' "Catechism of the Electronic Methods of Dr. Albert Abrams."

WITHIN the past two years there has spread over the United States a new and very dangerous cult, originated, developed and kept alive by a physician of Jewish parentage, now located in San Francisco. He is Dr. Albert Abrams, and from his new doctrines, with their hundreds of deluded followers, together with the electrically driven "apparatus" which he sells at five to seven times its original cost, this man is extracting a fortune estimated at $5,000 to $10,000 a month. The so-called "school of medicine" of which he is the founder, preys upon the three most dreaded and most deadly diseases known to man—syphilis, cancer and tuberculosis. With the wisdom gained through a complete knowledge of medicine, and with a number of years of honest medical practice to his credit, Abrams has selected these three bearers of terror to the human heart as his specialties. To them men and women respond most quickly; to be rid of them, or to evade even the fear of them, men and women will pay everything but their lives, and with this new cult—whose octopus-like arms reach from the Pacific to the Atlantic—"the pay's the thing."

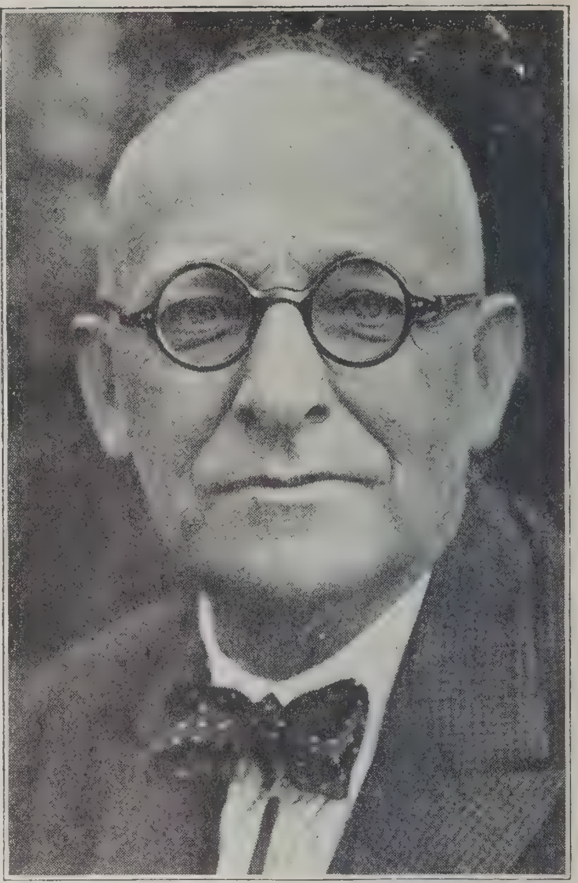
The writer has just completed a thorough investigation of the most important, the most dangerous, and the most expensive of all the machines with which Abrams and his followers claim to diagnose and cure disease.

So far as two of the leading independent electrical engineers of the Pacific Coast could learn from demonstrations, tests and dissection of this machine, it has not the slightest effect on the patient who is "treated" with it.

So far as the most delicate of galvanometers could tell, not one iota of the electric current which is put into this machine passes on to the patient.

So delicate was the galvanometer used in this test that the writer, by taking the two terminals in his hands, was able to supply from his own body, without any electrical connection, sufficient electricity to move the needle; yet the Abrams machine, sold as a cure-all for the three deadliest diseases known to man, was unable to produce a single movement of the galvanometer needle.

Of this test—complete official report of which is published herewith—more later. Let us first consider the claims of Dr. Abrams and the "ERA Cult." The mysterious ERA, it should be said, stands for the "Electronic Reactions of Abrams," and were the thing not so deadly dangerous and so damnably insidious, it would be ridiculous. There are various stories of Abrams' age, the manner in which he obtained his medical training and degrees, and of his career prior to his discovery of "Electronic Reactions." His own claims, as published in "Who's Who in America," for 1922, are that he was born in San Francisco, December 8, 1863, the son of Marcus and Rachel (Leavy) Abrams, and that he received his degree of Doctor of Medicine at Heidelberg University (Germany) in 1882. This would mean, if true, that he was only 19 years of age when he was intrusted with the degree of M.D., by that university, a statement which becomes more credible when it is remembered that more than one degree has been obtained from certain German universities without the formality of long study, and that Jews have been for centuries famous for obtaining things, including university titles, by unusual methods. Abrams also claims the Master of Arts degree from Portland University, an educational institution which has been closed for some years, and the degree of Doctor of Laws the source of which is not made public.



(C) Underwood & Underwood

DR. ALBERT ABRAMS, of San Francisco.

Abrams also describes himself as "founder of Spondylotherapy, and honorary president of the American Association for the Study of Spondylotherapy," which is the treatment of disease through manipulation of the vertebrae of the backbone. He is also "president of the American Association for the Study of Psycho-Physical Research; discoverer of Abrams' Reflexes, and of the Electronic Reactions of Abrams," from which last-named "discovery" has grown the cult now known as the International Association for the Advancement of Electronic Medicine, of which Dr. J. Goodwin Thompson is president, **and of which Alexander Markey, editor of *Pearson's Magazine*, is—according to Abrams—"the champion and fearless exponent of justice."**

To put Abrams' claims briefly, so that the layman may understand the better the astounding results of the investigation of Abrams' machine, it should be said that he claims to have discovered that every illness to which man is heir is due to erroneous vibrations of the electrons, which, as commonly believed by scientists, are the ultimate divisions of which matter is capable. Their size is beyond the microscope; their vibratory rate is unknown, and there is no way of measuring it—yet Abrams claims to have discovered, not only that matter is composed of electrons, but the rate at which these electrons vibrate. Based on this amazing discovery, which, **were Abrams able or willing to prove it,** would upset the entire scientific world and possibly reverse our conception of matter, the versatile doctor has devised a system of contrari-wise vibrations, by which the electrons may be convinced of the error of their ways, set back on the proper vibratory rate, and the disease thereby cured.

Incidental to this is his further discovery that by taking the rate of the vibrations of the electrons in a drop of blood, he not only can diagnose the disease from which the owner of the blood is suffering, but he can also fix the parentage of the person from whom the blood was drawn. Abrams has been able to have himself called into court as an expert in deciding the parentage of a child—and received therefore reams of money-getting publicity, **although it is not of record that the court accepted the test as final.**

Abrams has refused at all times to submit this machine—which he calls the "sphygmobiometer"—to tests, the results of which were to be published in the California *State Journal of Medicine*. It was proposed to take blood from several hundred patients in the clinics at the University of California and at Stanford University who were known to be suffering from the diseases which Abrams claims to be able to diagnose through this machine by means of the vibrations of the electrons in the blood. These patients were to be numbered, the numbers corresponding with those on the blood samples furnished Abrams, and the correct diagnosis of each case was to be sealed, in an envelope bearing the corresponding

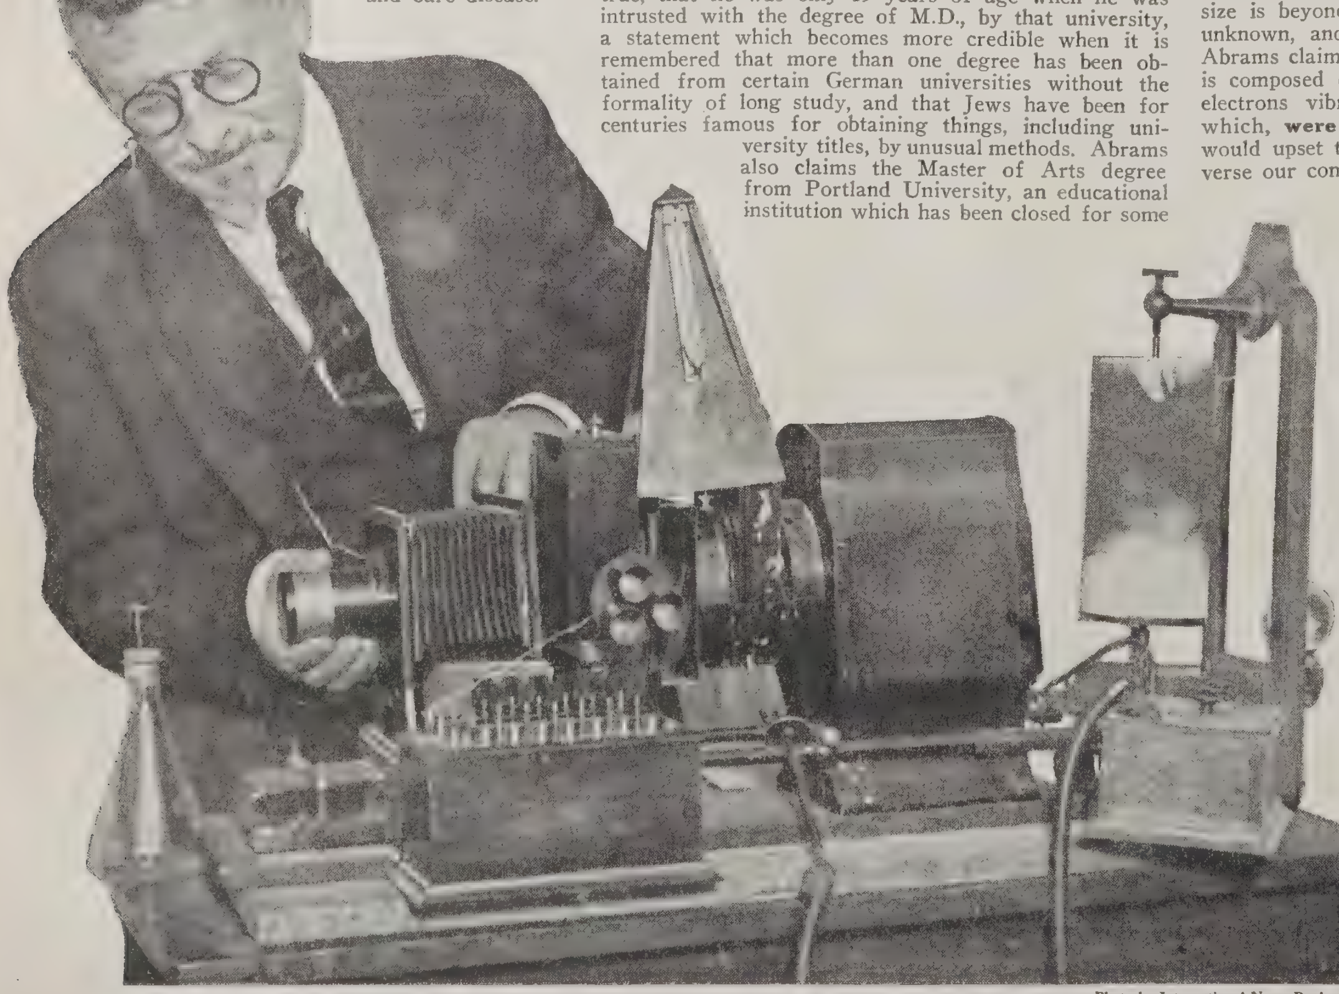


Photo by International News Reel.

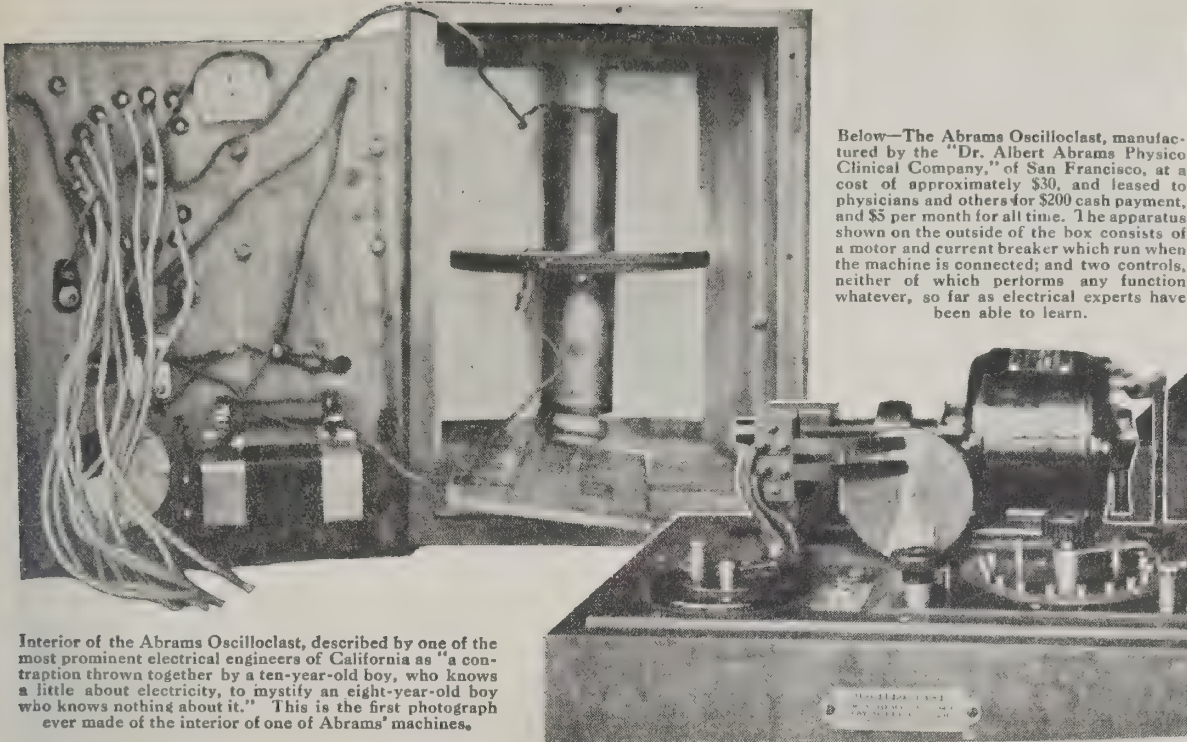
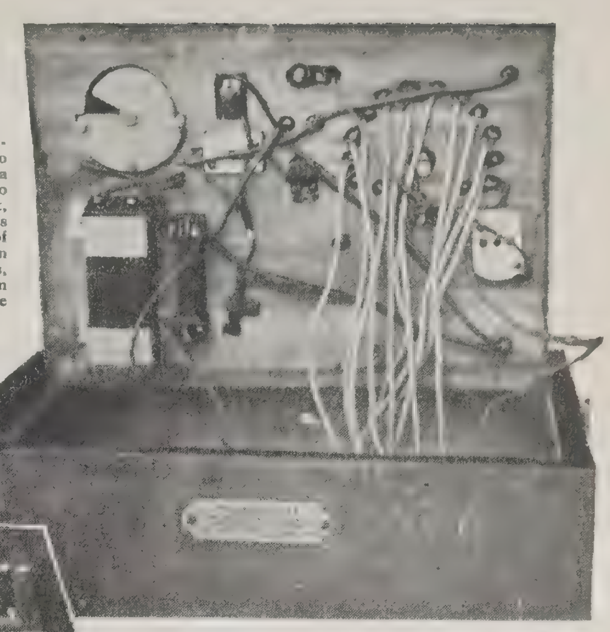
Abrams' most celebrated instrument, the "sphygmobiometer," by which he pretends to establish the parentage of a child through comparison of the vibrations of a drop of the child's blood with those of a drop of the blood of the supposed father. This instrument in the hands of an unprincipled operator could be productive of more harm than an electric chair. Reputable physicians of California declare the machine to be a "bunch of junk."

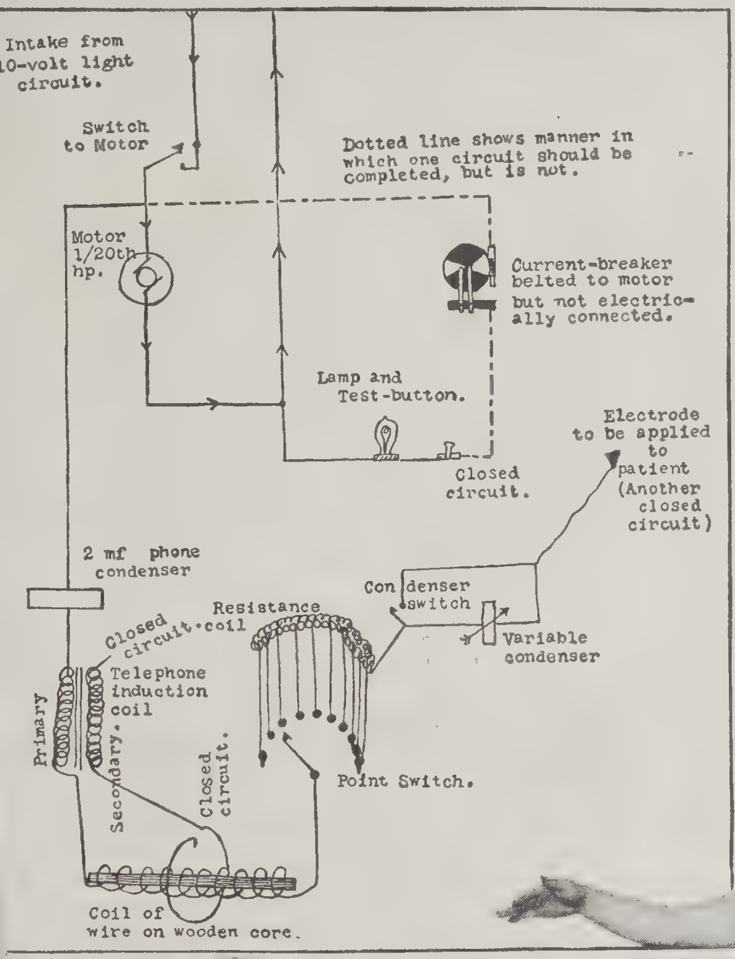


Below—The Abrams Oscilloclast, manufactured by the "Dr. Albert Abrams Physico Clinical Company," of San Francisco, at a cost of approximately $30, and leased to physicians and others for $200 cash payment, and $5 per month for all time. The apparatus shown on the outside of the box consists of a motor and current breaker which run when the machine is connected; and two controls, neither of which performs any function whatever, so far as electrical experts have been able to learn.

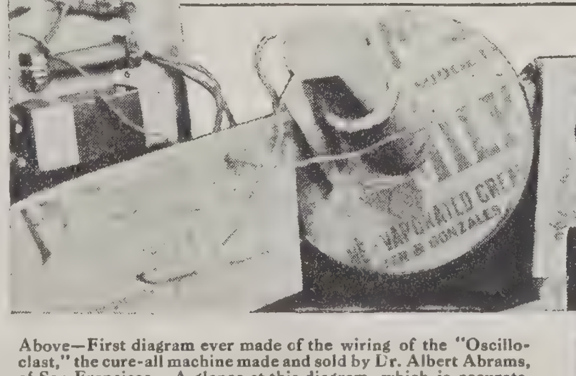
Interior of the Abrams Oscilloclast, described by one of the most prominent electrical engineers of California as "a contraption thrown together by a ten-year-old boy, who knows a little about electricity, to mystify an eight-year-old boy who knows nothing about it." This is the first photograph ever made of the interior of one of Abrams' machines.



The under-side of the top of the Abrams Oscilloclast, showing the wiring, a jumble of wires, the most of which begin nowhere and end nowhere. The motor, current-breaker and controls shown in another photo are on the opposite side of the upright board, the top of the box.



Intake from 110-volt light circuit.
Switch to Motor
Dotted line shows manner in which one circuit should be completed, but is not.
Motor 1/20th hp.
Current-breaker belted to motor but not electrically connected.
Lamp and Test-button.
Closed circuit.
Electrode to be applied to patient (Another closed circuit)
2 mf phone condenser
Condenser switch
Resistance coil
Closed circuit.
Variable condenser
Telephone induction coil
Primary
Secondary.
Closed circuit.
Point Switch.
Coil of wire on wooden core.



Above—First diagram ever made of the wiring of the "Oscilloclast," the cure-all machine made and sold by Dr. Albert Abrams, of San Francisco. A glance at this diagram, which is accurate, will show even to those untrained in electricity, that it is impossible for any electric current in any form to pass from the intake at the top, to the patient on the right. Below—"Apparatus" from the interior of the Abrams Oscilloclast, made, as will be noted by the lettering, from the ends of discarded packing boxes which once contained condensed milk! At the extreme left are shown a 2-mf. telephone condenser and a telephone induction coil. Below is a shelf which separates the upper half of the box from the lower. In the center is a so-called "induction coil," consisting of one wire, wound around a wooden core, and covered with parafine and a pasteboard tube, the whole thrust through a wooden wheel around which is wound one strand of wire, which is then cut off, completely closing the circuit and insulating the two wires by means of some four inches of wood. This coil is, of course, worthless so far as the conduct or transmission or induction of electricity is concerned.

Photo by International Newsreel

Dr. Albert Abrams demonstrating his "electronic reaction" instrument for the diagnosis of disease. The patient is holding what is supposed to be an electrode to his head, and Abrams claims to diagnose the disease by thumping on the patient's abdomen. The terminal in the electrode *does not touch the patient*, but that seems to make no difference with Abrams or his diagnosis.

number. ,Abrams was to know nothing of the cases, and his diagnoses, made with the "sphygmobiometer," were to be compared with the known facts in each case, and the results published. Although—or possibly because—the results of this test would have established Abrams as the greatest medical expert and inventor of the century, or as the greatest medical charlatan since the Jew Friedman and his T.B.C. serum, **the San Francisco discoverer of electronic reactions refused to make the test.** He, however, continues to sell, or lease, this machine to all who have the money to pay for it.

In fact, there seems to be no limit to the "discoveries" of Abrams. He can tell a mother-to-be whether her child will be a boy or a girl, merely from the examination of a drop of the mother's blood. From handwriting he can tell just where the writer is, or was, when he wrote the letter; whether the writer is alive or dead, and from what disease the writer is suffering. In all these diagnoses, nine times out of 10, the answer from Abrams is either syphilis, cancer, or tuberculosis. Rather oddly, **these are the three diseases for the cure of which man will pay the most money most readily.** He also has discovered that, with a tuning fork, he can record the "pitch" (possibly he means rate) of vibration of the light waves from colors. It is rather generally conceded that the maximum vibration of the tuning fork is about 16 000, while that of the light waves from some of the colors is far up in the hundreds of millions; just how the vibrations of the color orange, for example, could be measured by a tuning fork is a little difficult to comprehend. But, in reaching his conclusions, in making his discoveries and in building his apparatus, **Abrams quite ignores such things as the laws of physics, electricity or light, so that one cannot expect to hold him to facts, comparative tests or even workable theories by any known laws of science.**

An outgrowth of his "study" of colors and vibrations and tuning forks and things has been the "discovery" that certain kinds of paints—**made and sold by Abrams**—will cure certain diseases. Suppose you have a lot of bacteria in any part of your anatomy. If you haven't them, trust Dr. Abrams to find them! He "percusses" you, while one of his instruments is attached to you, until he finds the colony of microbes. Other physicians find them by analysis and the use of the microscope; not so the man who received at 19 a degree from Heidelberg. He finds them with the Electro-Concussor ("$120, f.o.b, San Francisco; no apparatus sold on credit; terms cash"). Then he "percusses" them, drives them by hand all into one place, say the spleen, or the liver, or one kidney. Then he paints the exterior of the patient's anatomy, over the internal organ in which the "bugs" are gathered, with a paint which has a vibration equal to or stronger than that of the disease he has diagnosed. Just how the vibrations of the pink, blue, green or other-colored paint set up those deadly Electronic Reactions of Abrams (ERA) among the microbes buried five or six inches beneath the skin, is not made clear, but they just do it somehow, and presently the patient has the paint and Dr. Abrams the pay, and there you are.

Abrams has several machines, of which he is the inventor, and of which the "Dr. Abrams Physico Clinical Company," of 2151 Sacramento street, San Francisco, is the vendor. The builder is a young man, about 20 years of age, who has some slight electrical knowledge and who was formerly employed as a workman by a company which makes electrical apparatus in the California city. This boy builds according to Abrams' plans; he is in no way concerned in the medical, ethical, moral, or "business" results obtained. Abrams also has other machines, aside from the "sphygmobiometer," and the "electro-concussor," but the greatest of his inventions, and the one which has spread its sphere of malevolent influence over the offices of more than 500 physicians in this country alone, is known as the "Oscilloclast"—a machine intended to cure disease by oscillation, or, more plainly, by vibration. There are, all told, about 1,200 of the various "inventions" of Abrams, in the form of diagnostic and curative machines, in use by physicians in this country. All except the Oscilloclast are sold outright, at prices varying from $60 to $200. The Oscilloclast is not sold, but rented for life, at $200 cash down and $5 a month as long as the physician leasing the contraption keeps it. The first payment of $200 is not a deposit, but a payment which goes direct into Abrams' pocket and stays there. **The complete machine costs Abrams about $30.**

The writer, with one of the foremost and best electrical experts of the Pacific Coast, has just completed a thorough investigation of the Abrams Oscilloclast. This is the first time that any one of the Abrams machines has been subjected to analysis by an unbiased observer whose technical training is adequate to enable him to make such an investigation and to reduce the results to a statement of fact. For the first time, also, the exterior and interior, with all the details of one of the Abrams machines was photographed. The results of the investigation follow; the photographic results are presented herewith.

The Oscilloclast was not submitted for investigation by Dr. Abrams; far from it, but came into the hands of still another electrical expert in San Francisco, from one of the many physicians who have been lured by the extravagant promises of cures effected by this machine into obtaining one of them. This physician, getting no results from the Oscilloclast, and becoming suspicious as to its capabilities, asked the electrical expert to give him a report on the machine. This electrician made his own "diagnosis" and then, for confirmation or disproval of the correctness of his results, turned it over to Frank Rieber, head of the Roentgen Appliance Corporation of San Francisco. Mr. Rieber is the inventor of the

An American Found on Manhattan

The Dearborn Independent regrets that it has not the honor of a personal acquaintance with an American citizen residing in New York, whose name is Henry A. Wise Wood. It is so delightful to have an expression of Americanism emanating from New York that we are naturally curious about the individual whose alertness to see and whose courage to speak distinguish him from the soul-bound and tongue-tied hordes of our modern Babylon. We had almost begun to fear that in that monster nest of alienism, the American voice had been stilled forever. But at a luncheon an American spoke out, and he said things that 500 important Americans should be saying in New York and every pulpit and platform should be echoing in the midst of what Mr. Wood calls "an un-American and alien-hearted city."

New York is not "the American metropolis" because it is not American. New York is the Island of Manhattan lying to the eastward of the United States. Severed from the United States, a polyglot anarchy, it could not be more separate from us than it is. One thinks of the Americans marooned there as "the lost Battalion" whom it would be only duty to rescue, either by carrying them out of the midst of the Manhattan wilderness, or by occupying Manhattan by a sufficient number of Americans to give it an American mandate.

Nevertheless there has been sounded one voice in New York. There may be others. Doubtless there are others. Speaking in unison, what might they not accomplish!

Mr. Wood said many things. He said that the school teachers of New York should be required, like other important public officials, to take the oath of loyalty.

"I was born in New York City. My ancestors lived in it more than one hundred years ago, and my wife's ancestors three hundred years. We both feel ourselves to be aliens here, or rather we feel ourselves to be Americans in an alien city. When the local authorities will not protect the nation, the nation must protect itself. It cannot depend on the States, since the States are filled, as in this State, with anti-American groups. Your children are now being Sovietized in the public schools because the authorities haven't the courage to suppress the teachers who are teaching disloyalty, and you sit by and do nothing."

The last seven words of the quoted sentence is the answer to What's wrong with America?

Alien groups are simply following their nature. It is quite to be expected that they should do everything we see them do. But are Americans naturally cowards?

The Cost of Coal

ABOUT two centuries ago, before the value of anthracite for fuel purposes was known, Stephen Girard acquired title to a lot of land in Pennsylvania. The cost to him was trifling, for there was little apparent value in the land except the timber with which it was covered. But as timber was enormously in excess of demand, and much more accessible than Girard's lands, it was really a dormant investment until accident developed that anthracite underlaid the tract and revealed the fuel properties of the coal.

In 1921 three million tons of hard coal were extracted from the Girard properties at a labor cost of about $1.73 a ton. The consumer paid for this an average of $14 a ton, the spread being absorbed by royalties, operators' profit, jobbers' charges, wholesale and retail handling costs, and transportation.

Of these additions to the labor cost of less than two dollars at the mouth of the mine, the royalty amounted to $1.33 a ton. That is, every consumer of anthracite paid tribute to the heirs of old Stephen Girard at the rate of 77.1 per cent of the labor cost of mining. Inasmuch as subsequent profits passed on to the consumer included a percentage on the royalty as well as the labor cost, it is reasonable to estimate that the latter was taxed at least TWO DOLLARS FOR EVERY TON OF HARD COAL BURNED for the benefit of an estate which never produced an ounce of coal, or assisted in the development of this important natural resource.

Of course, the system of private production is controlled so as to secure the greatest profit the public will submit to. Indeed, the profiteering has been such as to bring into competition with anthracite, bituminous coals, from the best to the dirty, health-endangering, sulphur-hiding shale, coke and even coal gas itself, but it is only this phase of the problem that needs emphasis just now. Its legality is not in question, for the laws of private property and of inheritance are such as to protect the estate from any demands save those of the taxgatherer, and these the estate is permitted to recoup at the hands of the consumer.

But there is a higher law, which denies the moral right of individuals as such to take unto themselves private and exclusive control of a natural resource that they may profit at the expense of their fellows. The exaction of any *tribute* at all on anthracite coal, whether by royalty or *excessive* charges, is theft, pure and simple. The two dollars royalty morally belongs to the man who burns the coal. Excessive charges of any kind, by railroads, brokers or anybody else, shares the character of the theft.

The Girard estate is used only to illustrate. Thousands of acres of coal lands are owned by big rail corporations, which in turn are owned by that group of financial magnates best known as "Big Business" and "Wall Street."

A Warning

YOU as a newspaper reader do not know, frequently the editor of the newspaper which you read does not know, that much of the stuff he prints and you read is often prepared—not in the newspaper office, but in a distant propaganda headquarters—to mislead you. The purpose is to plant certain ideas in your mind which will enable far-seeing and selfish interests to perform certain acts without exciting your suspicion or disapproval.

No newspaper staff knows enough about the subjects which its columns discuss, to judge whether the public is being deceived or not. There is a certain number of columns to be filled every day, and outside "service" is bought to fill those columns. There is one honest news service in the country; if there are two, we are luckier than informed persons now believe.

Just now you are reading daily screeds about the "labor shortage" in this country. The papers tell us that the shortage of men is so great that the industries of the country are endangered.

As a newspaper reader, clip out all such articles and see if they bear any clue of a responsible source. See if a name is attached to them.

And then look round the streets of your city, look over the farm districts, and see if it is true that there is a "labor shortage." It is a matter which can be decided by common observation on the streets, or by common acquaintance with the situation of the city dwellers and the farmers.

The motive behind the daily injection of this false idea is palpable.

As to "the shortage of skilled labor," that is due to an industrial system which has been built up by unskilled labor and has made no provision for the training of skilled labor for the future.

Unrestricted immigration will not supply skilled labor, and of the kind of labor that unrestricted immigration could supply, we already have enough.

This is not to say that the United States cannot support more people. The United States can support many times its present population. But not under the system which now dominates its present population.

One Woman Speaks

Dear Mr. Editor:

As you say you stand for the truth and uphold all that is good and clean I want to ask you a few questions. Every newspaper you pick up nowadays has some kind of a cash prize offered for most anything under the sun from the prettiest girl in the state to naming a picture puzzle; but, say, did you ever pick up one and find a prize offered for the rearing of children, or—say—to the youngest appearing mother of four or more children? You have not. And that is one great mistake the American people are making today. Who have the large families in this country? Look around and see if 75 per cent are not foreign-born people. And how are their children reared? I'll tell you. To love the old mother country first and the good old U. S. A. second. Or, if it is a family of American-born they are people without ambition and who are very poor, who let their children run the streets—and what kind of men and women do those children grow up to be?

Even take it, for instance, in our places where a man seeks employment; the first thing they ask a man is how many children he has, and if he says more than two his services are not required. Yet if the clean, right-thinking class of Americans do not rear children what will our country be in the next hundred years?

I am only 27, but I'm the mother of four husky 100-per-cent American boys and one baby girl. Their ages are 9, 7, 5, 3 and baby Mary 16 months old. Now, many of my friends think it a shame I have so many children at such an early age but I'm proud of every one of them and expect to rear them to be clean-minded, right-thinking 100-per-cent Americans for America.

I am neither highly educated nor poorly so. Just the average American and my husband is 31 and the same type. He neither gambles nor drinks "white mule." How could he with a family of five children and only receiving $20 a week? Yet he has the ability to have charge of a grain elevator but good jobs he cannot hold, as I said before, on account of our having a family. My husband approached one man for a position and the first thing he asked was, "How many children?" And when husband said four—nothing doing. He hired a man who had no children and paid him $40 a week. Just the same, somehow, we are going to manage to rear and educate our children the way all children should be reared and I'm sure when they are all grown to manhood and womanhood we will be amply repaid. Remember what Christ said, "A good tree cannot bring forth corrupt fruit," and so it is with us people also.

Many people have asked how I kept so young looking and had five children, and I tell them that is why I'm young looking. I've led a clean, wholesome life, never indulged in real late hours nor any of the things in life which tear down the body. I never was really ill a day in my life and can do as much work as some men although I only weigh 134 pounds. Then others have asked why I had children when so young. That is because I'm young with them and I can better understand their moods and attitudes than I could if I was old and then, too, I will still be young when they are grown. Others have said, why deprive yourself of so many things when you are young that you might have children? I do what work I can to help along, such as dressmaking, baking for other people, and so on, but I can say this much: When I've grown old I have not wasted my life and my children will be living monuments of my life's work.

The Same Old World

THE nineteen hundred and twenty-third cycle in the Era of Our Lord came, and with it the grace and power of governors to pardon prisoners.

In better times than these, pardon was always granted to a limited number of prisoners at the Christmas season of peace and good will to men. The season came as a golden opportunity to undo part of the wrong begun during the heat of the war; for 60 political prisoners are still awaiting their freedom; they are still suffering for expressing during the war opinions, many of which have since become well recognized and authenticated facts.

Many persons waited with high hope to see how our President should use this, one of the greatest of powers conferred on a single man. It was a sad disillusionment, therefore, to learn that these are the three men President Harding chose to grant Christmas pardons: John Carl, convicted in Alaska of murder in the second degree; Thomas Parker, convicted in Texas for manslaughter and John Willard Delaney, convicted in California of forgery.

Mr. Ford's Page

THE only possible use of objection to what IS, is that it may lead the mind to discover why it IS. There are causes for every condition that hinders or affrights us. Some of these causes are curable, others are far past cure by anything we may undertake and will have to run their course, as does a fever. But nothing comes upon society without cause, and certain conditions among us will continue to exist as long as the favoring causes exist.

No one can be certain that the very bad results of certain social courses are not in themselves good. As much of the discomfort of disease is not caused by disease but by the forces of health combating the disease, so many of the things of which we complain are really the result of the *good law* interjecting itself to fight the tendencies of the bad cause.

"The way of the transgressor is hard" for the reason that natural law seems to have placed barriers across every path of transgression, and the individual or the nation or society, as the case may be, must actually strive to make progress on the wrong course.

We have been transgressing the law of living together, as social beings, as citizens, as servants of society in our labor. And it has not been easy. There are signs that it is so very hard to do so, that we shall not be able to continue on the present course very long. It has exhausted the energy of society to get as far as it has on the wrong course. There have been so many obstacles to surmount, that it has not been easy. The downward course is not merely a drift, it is an effort. The way is hard and requires hard efforts to make it.

What daunts society is that the greatest efforts are yet ahead if this present course is to be maintained, and society is not equal to maintaining the present course against any additional obstacles. Heretofore the course has lain along territory in which we have the most freedom. It has lain in the region of intangible things—rights, duties, spiritual obligations, the finer implications of whatever moral stature we has reached. These are easily brushed aside. We can strip men of their rights; we can break all the obligations of honor; we can push aside the old aspirations as unattainable ideals; we can forego our duties. In the great task of building an industrial civilization we have found nothing easier than to brush aside the principles which two generations ago held the public mind with stronger grip than any political regulation. Like boys, when they find they can break all the commandments without the skies falling or the thunders of wrath bursting upon them, our generation has revelled in its freedom and has gained a very superior feeling to the whole urge of moral idealism.

IN ONE region man is free; when he plays the fool there, he gravitates to the region where he is no longer free, but in the grip of law. The nations have passed out of the region where they can play fast and loose, into the region where necessity grips them. It is always the result of abusing freedom. The world is passing through its correction chamber, squaring accounts with all the moralities it has blasted and all the obligations it has denied. In that chamber it will be stripped of all its old leadership and delusions, all of its superior-mindedness, all of its impudence against the law. The cries heard now are not the cries of peoples who fear to be unloaded of their burdens, but the cries of old systems which are inexorably being pushed over the precipice of judgment.

In that province we were free to do pretty much as we liked. But there is another province where we are never free unless we are obedient to its laws, and we have already entered into that province and are feeling the pinch of its correction. In the region of natural law the rule of Obedience is never suspended. It is in that region that the world now finds itself.

The fact is, the world is now up against something with which it cannot play fast and loose. It has plunged down through the region of its freedom into the region where it must obey or suffer. We have brought all our new tendencies down with us into this region of unbroken law and the result is that much of what we brought is being broken against the law. After having abused our freedom we have come into the correction of the universe.

It is all very simple and apparent, yet a failure to see this is at the base of most of the confusion of mind today. Society can have its fling in its own region of moral freedom, but that fling brings it down to a region where accounts are squared, and where speeches and laws and elections can do nothing at all—where even the power of the Congress stops! The course we have adopted in the sphere of our moral freedom has thrown us down into the region of inexorable economic law, from which neither our cleverness nor our crying can extricate us. Like the son who wasted his patrimony, we are now at work for a stranger in a far country, and the situation is not pleasant.

That is the meaning of the lack of leadership in the world. The old leadership is still here; the old leaders are still stamping on top of the earth; and still the world cries for leadership. Why is it? Inarticulate as humanity is, it has the instinct to know that the old leadership is just what it does not want at this crisis. The leadership that for the last half century has steadily led down into the present situation is not capable of leading back again. That leadership, by the way, was not leadership in the absolute sense, it was only the incarnation of the people's willingness to be led in the wrong direction.

And now the world is looking to America. Nothing is more pathetic than to hear the recent confessions of Europe that the hope of the world is American leadership. The confessions of Europe have become more and more humiliating as time has passed. First it was force she asked—confessing that her own force was inadequate. Next it was money she asked—confessing that her wealth was not great. Now it is leadership—bitterest confession of all.

The confession has had the shameful effect on America of puffing us up. We have even boasted about our being able to pull Europe out of the hole, if we would. How far we ourselves have fallen, when this can be true!

But Europe is grasping at a straw, and one fears what may occur when she at last lays hold and finds it only a straw. American leadership! Where is it? "The moral leadership of America!" Europe cries. Where is that? Have we transgressed less than Europe that we should be worthy of "moral leadership"?—or is there still behind this cry the lurking belief that with our "moral leadership" our money and force would also be available.

When Americans look at their Government, scrutinize the men who have the affairs of this Republic in charge, and then think of setting them to handle the affairs of Europe—those men who have failed to handle the coal situation, or the railroad situation—it is at that moment, as never before, that Americans realize the depths into which Europe has fallen.

Government will remain, but the present governments will not —they will go. Their going will not mean much change, if any, in the form of governments, but in the spirit of them. The present governments of Europe—the premiers and the parliaments—are not able even to agree or collaborate in the salvation of Europe. Too many things must go with which the personnel of these governments is entangled. "Sell all that thou hast and serve the poor" is an injunction these governments will not obey, and yet it is the only principle upon which any government can stand.

Just now the cry is from governments for the salvation of personnel, of aristocracies and armies and privileges and oppressions. The cry is from government to government across the world. Presently it will be from people to people—and *then* we shall know that the period of correction has taken a turn toward restoration. The people have not spoken yet.

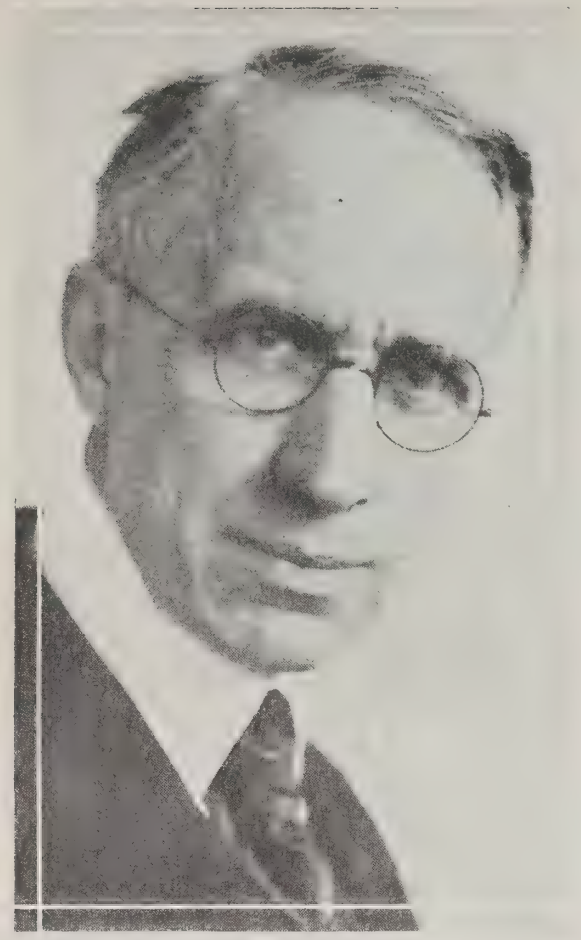
This is why America is silent. It has heard Clemenceau and Stinnes and Lloyd George and the others; but it does not trust these voices. Nor did France, Germany and England trust them. When America hears the voice of the people across the seas, then the world shall know that the tide has taken a turn.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Dumping Cleveland Bosses on the Scrap Heap

Manager Plan Soon to Go Into Effect Gives City Back to People

By ALBERT SIDNEY GREGG



PROF. A. R. HATTON,
Western Reserve University, leader for the city manager plan in Cleveland.

A DISTINGUISHED political writer, whose name I cannot now recall, once defined a political boss as a man "who bought votes and sold privileges." That definition holds good regardless of the crudities or refinements of the game. It matters little whether the voters are acquired at a certain price per head, or by the manipulation of influences that herd voters up to the polls like sheep. Details do not count for much. The big idea is that voters are often controlled by a boss in the interest of the Gas Company, the Street Railway Company, the Allies of the underworld, or other special interests, who are glad to pay well for services rendered.

A successful boss controls a small army of officeholders who owe their jobs to him, plus another group who willingly do his dirty work in the hope of a reward. The interests who wish to plunder the public supply the boss with an expense fund which he uses as he pleases, and "no questions asked." He manages to keep a large share of this money, and pays his henchmen out of the public treasury by having them appointed to city jobs regardless of their fitness for the work they are expected to do. Thus the taxpayers cheerfully pay the bill for allowing the boss and his gang to deceive and rob them. Obviously the ability of the boss to collect depends upon his ability to deliver what his employers want, but he is careful to collect before he delivers. The well-trained boss understands perfectly that there is no such thing as honor among thieves, so he gets his money in advance.

There is nothing new in the foregoing statements. The people have been either king-ridden or boss-ridden for so long that it is difficult for them to think in any other terms. Every tyro in politics knows how the "machine" operates, and realizes that very few men are able to master the "organization" and the boss. Therefore it is very refreshing for a long-suffering people to learn that a way has been found to dethrone bosses and put them on the scrap heap, along with other junk. A new way of doing things is in operation in a hundred or more cities much to the satisfaction of all, save those who have fattened on the spoils of politics.

Cleveland to Try It

THIS system is known as the Manager Plan of City Government. Thus far Cleveland is the largest city that has adopted the manager plan. The new form of government goes into effect on January 1, 1924. In November, 1923, a council of 25 members will be chosen under a new system of districting the city, and by a voting method commonly known as proportional representation. This council will choose a city manager, who will in turn appoint department heads, and serve as chief executive officer of the municipality. His position will correspond to the position of a general manager of a large industrial organization, the council being the board of directors and the voters the stockholders. He will operate under the regulations of the new charter and his authority in executive matters will be supreme. The council may engage a man for manager who lives in another city, but after his selection he must become a resident of Cleveland. If the council wishes to make a change it has the power to discharge the manager at any time and hire another man. Business and executive ability are the chief qualities demanded of a city manager. He is expected to run the city purely as a business organization, in the interest of economy, efficiency, and service and not for profit. For ceremonial occasions the president of the council will serve as "mayor."

Like other large American cities Cleveland has suffered from the domination of political bosses. No man who has a particle of political sense would think of trying to get anything from the Republicans in Cleveland or Ohio, without first arranging matters with *Maurice Maschke*, the recognized Republican boss. He is a power in both city and state affairs. On the other hand when the Democrats are on the throne, Burr Gongwer is the man who must be "seen."

When bosses are threatened with extermination they combine for mutual protection, just as kings sometimes form alliances. It is common talk in Cleveland that Maschke and Gongwer are back of the court attacks against the manager plan. Enemies of the new system are trying to have it declared unconstitutional because of the alleged confusion that would result from the proportional representation method of voting. That is the part of the plan that has caused the bosses to sit up of nights in a vain effort to find a way either to control the manager plan or destroy it in a perfectly legal and respectable manner. Bosses in other cities, where the manager plan is in operation, have tried to break the combination and have failed. Proportional representation is both fool-proof and knave-proof. It is so arranged that no man or group of men can defeat an honest expression of public opinion at an election held under this plan.

Fred Kohler, mayor of Cleveland, occupies a unique relation to the situation that is being analyzed. Eight years ago he was expelled from the high and honorable position of chief of police by the Civil Service Commission, on the charge of gross immorality and conduct unbecoming an officer. Newton D. Baker, who was mayor at that time, preferred the charges. Kohler was stunned at first by the verdict, for he had been riding on a high wave of popularity as the "best chief of police" for 10 years, but he rallied and doggedly set out to win his way back into public confidence.

How Kohler Worked

AT THE time of his dismissal Kohler announced that he would some day be mayor of Cleveland. All who heard the declaration regarded it as a boast. He was the last man anybody thought of for that position. For a year or two he dropped out of sight. What he did for a living nobody seemed to know or care. His name had all but disappeared from the city newspapers, and in the thought of many he was a "dead one." Then he bobbed up as a possible delegate to the National Republican Convention, but he was not selected. However, his name got into the papers again, and he began to develop a following. Finally the word went around that "Kohler had been punished enough." Quite a group wanted him back as chief of police, because of his ability as an officer.

Little by little Kohler "grew on the public" until he was mentioned as a possible candidate for mayor. He was slowly, but steadily "coming back." His little boomlet was squelched, but Kohler gained by the agitation. Finally Kohler sought election as county commissioner and won. Some of his opponents voted for him on the score that as "commissioner he could not do much harm." He was commissioner when the city election came on in November, 1921.

Kohler declared himself as a candidate for mayor. Half a dozen other candidates were in the field, and about all they did was to call each other names and sling mud. There was not a man among them strong enough to dominate the situation. Voters were generally disgusted. Kohler did not call names, sling mud or abuse anybody. He did not make any speeches, or announce a platform, except the general statement that if elected he would enforce the law. His campaign method was to run display advertisements in the papers, with his picture in uniform as chief of police, in which he asked for the votes of the people. He went from house to house and store to store, and announced himself thus:

"I am Fred Kohler, and I want you to vote for me for mayor."

The papers had a good deal to say about him. He refused to get mixed up in controversies with other candidates. Enemies dug up the old charge against him and scattered it broadcast. But Kohler ignored all such attacks.

Kohler, as an independent candidate for mayor, running without a party and no platform, was quite a different man from Kohler as chief of police. In former days he talked a good deal, and was free with his attacks and criticisms. Everybody expected him to "open his mouth and put his foot in it," but in that respect he fooled all the wiseacres by a steadfast policy of good-natured silence and refusal to talk. The explanation of the change in his character is that he was being guided by a small group of very shrewd men, and he had the good sense to act upon their suggestions. One of the admonitions persistently hurled at him was: "Now, Fred, whatever you do, keep your mouth shut," and Fred obeyed. It is greatly to his credit that he listened to somebody else. He was guided by a very rare order of political sagacity all through the campaign. The net result was that he made votes without making enemies, which is the supreme art of political management. At first he was not taken seriously, but a week or ten days before the election, straw ballots in the newspapers disclosed that he had developed surprising strength. Then the word went around: "Vote for Kohler and give him a chance to make good."

Meanwhile, Professor A. R. Hatton, leader of the city manager movement, whose home is in Cleveland, had been busy. A committee of one hundred representative citizens, headed by Peter Witt, kept the manager issue before the public with speakers and newspaper publicity. They capitalized the popular disgust with mud-slinging politics, and urged the manager plan as a remedy. Then Kohler and his little coterie of secret advisers "cashed in" on the manager plan publicity by putting out a fine portrait of Kohler bearing the legend: "Vote for Fred Kohler for mayor and you will have a city manager." That put Kohler in a class by himself and created the impression that a vote for Kohler was a vote against the bosses. It was all very clever. A strong argument for the manager plan was that it would not go into effect for two years, and therefore had no bearing on the immediate election. When the votes were counted it was found that Kohler and the manager plan had carried by large majorities.

Kohler, rejected as chief of police, had "come back" within eight years, and been chosen mayor, without a party and minus a platform. It is one of the most striking instances of a "come back" anywhere in American politics. Since his election he has had an absolutely free hand, and in the estimation of many is making a success of his job.

Kohler owes his election to a revulsion against boss rule, which was intensified by the mud-slinging tactics of the other candidates, and shrewd manipulation on the part of his intimate advisers, who evidently understood mob psychology. And the same hurricane of public resentment that sent Kohler to the mayor's chair, also carried the manager plan. While Kohler and his associates took advantage of popular feeling at every turn, the city manager people were doing likewise. They centered their activities on making the manager plan clear to the man in the street, and in this invaluable help was given by the city papers.

My reason for saying so much about Kohler is that he is still a factor in the situation. The office of mayor will terminate when the manager plan goes into effect. Kohler is the leading candidate for the job of city manager.

Depends on Councilmen

THE success of the manager plan depends entirely upon the kind of councilmen who are chosen. Anybody eligible to public office can become a candidate. Nominations are made by petition in each district, only 500 signatures being required. There is no pre-election primary. Any number of persons may run, and the electors may make as many choices as they please. Under the new plan a councilman holds office for two years, and receives a salary of $1,800 a year. He may be recalled by the voters of his district. Members of the council, as well as all city officers and employes, are prohibited from being officers in any political organization. City employes are also exempt from political assessments.

In place of the usual 32 wards with 32 councilmen, the city has been divided into four general divisions, each with a group of councilmen to be elected at large within the district. The new council consists of 25 members divided as follows: District No. 1, "West Side" business and residence section, seven; No. 2, "South End," manufacturing, five; No. 3, "central business section," six; No. 4, "East End residence section," seven. This elimination of old ward lines has destroyed the power of the ward politicians, for their mastery depended largely upon controlling voters within certain narrow limits, which no longer exist.

The method of proceeding with the count is thus set forth in the new city charter:

"The whole number of valid ballots cast in the district shall then be divided by a number greater by one than the number of seats to be filled in the district. The next whole number larger than the resulting quotient is the quota, or constituency, that suffices to elect the member. All candidates, the number of whose votes on the first count equals or exceeds the quota, shall be declared elected. All votes obtained by any candidate in excess of his quota shall be termed his surplus."

Surplus votes are then transferred to the other candidates in the order designated by the voters in marking their ballots. In case the quota is 8,000 and a candidate receives 10,000 votes he would be given just enough to elect him, namely, 8,000. His surplus of 2,000 would be distributed among the other candidates, according to the next available choice as indicated on each ballot by the voter. After the distribution of the surpluses, if enough candidates have not been elected, the candidate having the lowest number of votes is declared defeated, and his ballots are transferred in the same manner as the surpluses. As soon as another candidate gets 8,000 votes under this method of redistribution, he is declared elected. The process of declaring the low candidate defeated is kept up until all the seats have been filled, or the number of candidates has been reduced to the number of men to be chosen, in which event they are all declared elected.

Gastronomic Journeyings Through Europe

Including Story of Maid Who Wept When Wife Darned Hubby's Socks

By WILLIAM ATHERTON DU PUY

I MET Eddy Rickenbacker on Avenue de l'Opera in Paris and Eddy was in the midst of emitting chuckles as the old car rattles when you do a bad job in shifting the gears. He had just met four former pals of the Flying Corps, he explained, American lads back to see how France looked when there was no war. These lads had been in Paris for five days and had gone the way of youth and unrestraint, the result being that their appearance was much that of bouquets on their way to the garbage can.

"Eddy, help us," they called in chorus, with business of leaning heavily on his shoulder.

"Write the specifications," said Eddy.

"We want a French bootlegger," they lamented.

"Weird and inexplicable request," surmised Eddy. "What, may I ask, do you want with a French bootlegger?"

Then in unison came the response.

"We want him to get us a drink of water."

Which goes to show that there is a bit of difference in viewpoint and in the methods of supplying the inner man on the two sides of the big, salty, and at times quite upsettingly unquiet aqueous waste, that separates the blond-bearing continents. No, they don't serve water in Europe. You can buy the carbonated kind that gnaws around inside but just plain water from the hydrant you cannot get. And as for ice water! Well what do you mean "l'eau glasse?"

A little while earlier I had encountered an experience which sort of stands out as a headland in a modern and roll-nicking world, pathetically in contrast to post-war America, for I had encountered once in a lifetime conditions under which one could buy and buy and still remain practically as affluent as before.

Can't Get a Breakfast

I HAD crossed the Swiss border at Basel and was journeying up through Germany with intent to skirt down through the Rhineland where all the castles grow. I bought my breakfast on the train. To be sure it was not much of a breakfast. I had long since quit trying to get breakfasts in Europe like we eat back home. I well remember our first Continental breakfast. We had come up on the boat train the day before and had tarried a while at Hotel Continental, in Paris. It was a mistake. When you are in certain hotels in Europe like the Continental in Paris or the Savoy in London you are really back in New York so what is the use having bought all your seasickness. Then the next morning with my wife and little girls I caught a before-breakfast train to Switzerland. It was late and we were hungry when we got into the diner.

"Grape fruit, breakfast food, bacon and eggs," the family began to clamor noisily, enhancing the American reputation for high and penetrating voices.

"La, la," exclaimed Garson, gesticulating palms outward and hurrying away for one who spoke English and understood American.

Deferentially the head waiter explained to us that only the Continental breakfast was being served. At luncheon we might get the eggs but now there was available only rolls, coffee, butter and jam. So is it done in Europe.

So on this train in Germany I ate my rolls and jam. When time for payment came I handed the waiter a five-franc Swiss note which has a value a little less than that of an American one dollar bill. The result was almost as bad as that obtained by the tourist who dined in Dresden and paid with an American $10 gold piece.

"How much change do I get?" he asked. The waiter consulted with the proprietor and came back. He said: "How much do you want?"

His Tip—One Penny

WELL, my waiter brought back a handful of German marks and left them with me. In my profligate American way I pushed him back a 50-mark piece, worth $10 before the war. I had actually tipped him a penny.

I put this German money in my outside coat pocket. It felt all fluffy and abundant there and I got the itch to spend it. I called for the best cigars and got nicked two cents for three of them. I bought chocolates, cigarets, postal cards, guide books, bottles of beer. I ate lavishly at the noonday meal, had the most expensive wine, tipped like a millionaire. The change from my dollar bill seemed little affected. I became desperate. I was determined that I should spend a dollar in Germany. I bought a quart of *Mosel* wine, prime vintage of the Rhineland, and cached it in the bottom of my bag with the intent of smuggling it over the four national boundaries that intervened between me and home. There was nothing more to buy. Ten hours was not enough in which to spend a dollar on a German train.

Yet there are sharp contrasts to this possibility of economy in Europe. I shared a room at the Savoy Hotel in London with that commuter between the United States and Europe, Ernest Greenwood, of the International Labor Office. It only cost us $12 a day. We got our grapefruit, bacon and eggs, coffee with surenuff cream just as you can at any marbletop back home for 60 cents and it set us back $3 apiece. Dinner cost us $6 each. We walked into the cabaret restaurant afterward just because we were lonesome there in a big foreign city and thinking of our wives back home, like travelers always do, and wanted to hear some music. We sat down at a table. We were immediately surrounded by a group of Jessie Jameses. What would we have for dinner, they wanted to know, deadly like. We said we would not have a durn thing because we had just paid $12 to the Younger Brothers in the dining room. They said yes we would. We had to if we sat there and thought of home. We said we were guests of the hotel and we kinda thought we ought to be able to sit around as we pleased. They said no, that eating food went with sitting at those tables and it was four dollars a throw, wine extra. Could we pay the $4 and get a check that entitled us to do the eating some other time, Greenwood wanted to know. Could we pay it and not do any eating at all? No, we had to have food. So they brought it along and we stirred it up nasty like so they couldn't sell it to anybody else and talked loud about never staying at that hotel again, and the marvelous influence we could wield on the currents of travel from overseas, but the Wop waiters didn't know what it was all about and that was all there was to it.

Nothing in all the world could possibly contrast more strongly with the garish London hotels maintained for the purpose of harvesting American dollars, less English than a round-up mess in Wyoming, than does a visit to "Ye Olde Cheshire Cheese," musty and bedraggled there in Fleet Street. Shakespeare and the Elizabethans rolicked here before the great London Fire. The place was rebuilt one hundred years before the Revolution and had come into its glory in the days of Dr. Sam Johnson and Oliver Goldsmith. Not a detail has been changed. There is their table over in the corner and here on the window sill where you sit is a table which informs you that Charles Dickens sat here to write certain of the chapters of "The Tale of Two Cities." Upstairs is the room in which the coterie of Dr. Johnson used to gather on special occasions and the chair in which the dominant spirit sat. Here is served on Wednesday and Saturday the famous lark pie which was long ago put down as "a dainty dish to set before the king." By a secret process is it manufactured, six stone of it in a single baking. There is incased in its crusts succulent treasures of beefsteak, kidneys, oysters, mushrooms, larks, all spiced and gravied in such a way as to make it more nearly the masterpiece of English cookery than any other dish beneath the fog.

You sit there and argue with your English hosts. "Why," Greenwood wants to know, "don't they wear coat shirts?" Yes they still pull them on over their heads. "And why," I ask, "don't they throw away their suspenders?" "What would hold up your bally stockings?" they respond. Yes. Suspenders means garters in England. What you really meant to protest against was the British loyalty to braces. "Braces." That is their name for galluses and they all still wear them. They explain carefully to you that they would never think of stopping pulling their shirts over their heads or wearing braces for the very good reason that they had always done it. It is the English way.

With the Wine Steward

AND then one of them tells the story at the expense of an American which is more satisfaction to them than any other. It is of the overseas, hurry-up millionaire who asked the old gardener out at Cambridge how his wonderful lawn was developed. The American had a new place out on Long Island and would like a lawn just like this one. To develop a lawn like this, the gardener said the soil must be got into just the right condition. It must be properly sodded. Then it must be carefully tended and watered for four hundred years.

Then when the lunch was over you went with Pike, the venerable wine steward, Pike who had lived 40 years underground with his vintages, into the subcellars where myraids of bottles were laid away to add to their authority with the passing of the decades. Pike so maneuvered the situation that you must regard yourself as being placed under endless obligation to him if he condescended to decanter for you, being liberally recompensed, a bottle of his 23-year-old port. And when the ceremony was over you were under obligations, for it was a work of art there beneath the charred rafters of this basement, charred by the great London fire so many centuries ago that time is too weary to check them.

This wine has laid here for these reposeful 23 years, as Pike tells you. He put it here himself and has watched over it every day since. Look at this bottle here between you and the light. It has lain all the time on one side. After five years of quietude a heavy deposit is formed on the bottle. You can see it there, smoky and opaque. Then, when another five years has passed a different appearance is to be noticed. The deposit of the first half decade has been "cemented." The wine is 10 years old. The experts can tell. But the port is still young and should remain undisturbed. In five years more the "bee's wings" appear. Wait and you shall see them.

Pike proceeds to open the bottle, crudely as would the waiters upstairs. He uses a corkscrew. These venerable corks tear to pieces, of course. It is a bungler's job. Now here is the way he proceeds with the bottles that are sent down to him for opening. He takes a heavy knife, a butcher knife. This he runs up the neck of the bottle in such a way that the collar which encloses the cork is gently tapped. There are four or five such strokes on different sides of the neck. Then there is a final stroke more vigorous than the others. The neck comes off smoothly at the collar.

You are about to see the bee's wings. Pike pours out a glass of this heavy wine, transparent, live, moving oxblood. You hold it between your eye and the light. There they are, the bee's wings, born in its fifteenth year. They shimmer lacily through its somber depths as the honey gather's propellers might wag idly in the summer sun with a scarlet poppy as a background.

Or in London one may buy an Italian table d'hôte for three bob. You remember that the dollar table d'hôte in New York used to be the best gastronomic buy on the island for a man with much appetite and little money. Well, here you get the same dinner for 65 cents.

Which reminds me of a search I made in Genoa, where Columbus came from, for this same sort of meal. One is foolish when wandering about, I always feel, to do his eating in his hotel which is likely to be conventionally standardized and in no way to reflect the peculiarities of the community which he is visiting. In Genoa, for example, your hotel was likely to be on the fringe of that mile-square area which was the ancient town in which Columbus played as a boy. It is an odd, congested area into which no wagon can penetrate, so narrow are its streets. They were built so at the time when the commercial towns of the Mediterranean were principalities and each was prone to attack and attempt to destroy its rival. These narrow streets were easy of barricade and defense.

Into Heart of Old Italy

WELL, you go down one of these steep, narrow streets into the heart of old Italy. Here you dine as do the Italians. You begin with a plate of soup, vegetable soup, containing about a quart of liquid afloat in which is the succulent yield of all the gardens of the land of Mussolini. A plate of grated cheese is thrust upon you for purposes of sprinkling over this soup. This alone is nourishment for a day to the American appetite. You begin to get an idea which grows on you as you travel farther into Europe. These people eat much heavier meals than do Americans. Despite our prosperity we dine much more frugally than do Europeans.

Next you get in this Genoa restaurant, a large plate of spaghetti, likewise with the grated cheese. Then there is petifish, finger size, white, delicious. And veal. It is not profitable to allow the child of the bull to mature in Italy. You eat them while they are little. It is always veal. Then the cheese course is inevitable. After we had got to know the waiter he conferred a great favor on us one day. He had for us a treat. It was American cheese he served us. It is true. They are importing American cheese into Italy. One finishes with great pyramids of fruit, just shaken from the tree in the back yard. Your coffee is brewed and dripped into your individual glass while you wait. It takes 10 minutes for it to drip. Americans at home would never wait so long but in Europe there is no end of time. With it all you have had "wine of the country." Once you refused wine but the waiter was so hurt that you never had the heart to do it again.

But all of this was à la carte. It cost as much as a dollar and a half. You began to wonder about those Italian table d'hôte of New York and London. They would be wonderful in the land of their nativity. You hunted all over Genoa for a table d'hôte. It was not to be found. There is no chop suey in China and in Italy no table d'hôte meals such as we know.

Another culinary venture in Europe is the experience in getting oneself fed in a modest little apartment with a Swiss maid in Geneva. There was the problem of the maid, for instance. It cost 14 whole dollars to hire a maid for a month in Geneva. Then she messed things up by insisting on going to work at five o'clock in the morning. If you hadn't put out your boots (called shoes in America) to be cleaned she would sneak in and steal them. (There is one lone bootblack in all Europe, installed for the American trade in the Continental Hotel in Paris.) And if your wife attempted to darn a sock this maid was so hurt she wept. And she polished the floor every day and wouldn't go away until 11 at night.

Find American Breakfast Food

BUT, despite the reputed poverty of Switzerland, she gave you twice as much food as you got at home. If you declined her cheese course, for instance, she bought more cheeses for the next day on the theory that you didn't like the varieties presented. The roll call on cheeses at our house once mounted to 12 offered at a single meal.

Then one day we found a store with cartons of American breakfast food. Joy. Cereals for breakfast are unknown in Europe as also is the succulent grape fruit. Home with the package of shredded shavings. To the maid passed the message that they are to be served at breakfast with cream. This doesn't mean the same thing to her Swiss consciousness that it would to Mandy back home so your flaked wheat appears in the morning rampant in a seat of whipped cream.

If you are fiddling around at what Europeans regard as work you find that there are two hours for lunch which is a lot of time to kill right there in the middle of the day. Then at 4 p. m., your employer sends tea to your desk all paid for and everything.

There are those who hold that better food is procurable in the United States than anywhere in Europe. If this is true, and it may be true in certain fringes of epicurean America, it is because the Yankees have kidnapped the master cooks of *ma belle* France.

How We Are Passing the Buck to the Babies

Bond Issues Now Being Piled Up Will Be Burden in Years to Come

By J. V. NASH

EVERYBODY who has read Dickens' "David Copperfield" remembers Wilkins Micawber, whose chronic financial difficulties kept him forever in hot water. For years he went gaily on, contracting obligations and giving notes in payment, which he was unable to meet when due. Finally, with creditors keeping his house in a state of siege, he found himself at his wits' end.

Suddenly a brilliant idea struck him. He would negotiate a big new note, and with the proceeds of the note he would clean up all his old outstanding I. O. U's. A philanthropic money lender, in consideration of a heavy interest charge, agreed to put the transaction through. As Micawber arose from signing the note, he smiled happily and exclaimed: "Thank God! My debts are paid at last. Now I can look the world in the face!"

Dickens' satire may without exaggeration be applied today to the financial methods of the United States Government and of the various political units within the nation. The only difference is that Micawber did not try to pass the buck of his financial indebtedness on to his little children, to be saddled upon them when they became of age. In his rational moments, he must have realized that eventually bankruptcy and the debtors' jail would overtake him, as they did, but he knew that his children would start life with a clean slate.

Of course, any government which forced children to pay, by the sweat of their brow, the debts piled up by wasteful and incompetent parents and grandparents, would be considered barbarous. Yet the United States Government today, by its own financial policies and the financial policies which it is encouraging in the state and municipal governments, is doing what it would not permit a citizen to do individually—to pledge the earning power of his children to secure money to pay his current bills.

Our Federal and local governments are piling up vast debts, and when they fall due adopting the Micawber system of "refunding," by issuing new notes. These new notes, euphemistically called *bonds*, generally have so long a time to run that the debt is in reality passed on to coming generations, which never contracted nor benefited from the loan.

Only last autumn the United States Government announced a new issue of half a billion dollars' worth of bonds, payable in THIRTY YEARS—October 15, 1952, when babies now unborn will be paying taxes. On that date the big bondholders and bankers of Wall Street who hold the bonds will present their bill for the vast principal on which interest shall have been accumulating while the generation of that day has been growing up from childhood. Meanwhile, the generation of 1952 will have its own debts to pay in addition to those of its fathers and grandfathers. It will accordingly face the alternative of going into bankruptcy, or refunding the old debts again, at a higher rate of interest, and so passing the buck on again to its own children. But as long as the Wall Street bankers and bondholders can collect the interest from each generation, and live off it, "they should worry."

How U. S. Is "in Hock"

IN ORDER that I might not be mistaken as to the purpose of the recent Half-Billion Bond Issue, I wrote to a banker friend in Chicago for confirmation of my understanding, and received the following reply:

"You are correct in your assumption that the new issue of Government Certificates is to retire a portion of the Victory Liberty Loan 4-3/4s and to refund certain Certificates of Indebtedness which are maturing. I am enclosing a circular which we have recently printed in connection with the loan and it may be of interest to you. I have noticed recently in the papers that on the basis of present budget estimates there will be a shortage for next year of approximately $700,000,000, and I wouldn't be surprised if there would be a very substantial issue of like government securities at this time next year."

The extent to which the United States is "in hock" to the Great Money Power seems to the ordinary layman almost incredible. The figures, however, can easily be verified at any public library.

Moody's Investors' Service, of 35 Nassau street, New York City, publishes a series of rating books, setting forth particulars regarding various classes of securities. Government and municipal securities occupy a separate book. The volume for the year 1922, which merely lists the current outstanding issues, is a book rivaling in size Webster's Unabridged Dictionary.

In this book the outstanding bond issues of the state of New York require more than 130 pages for mere listing. Besides the bond issues of the state government, there are listed the bonds of some *two hundred* different cities, towns, villages, school districts, and counties. The grand total of public debt for this *one state* is in the neighborhood of *two billions of dollars.* It is the same story with all the other states.

How much the total indebtedness represented by government bond issues throughout the country amounts to, is difficult to determine. It is so vast, that apparently no one has attempted to compute it. I wrote to the publishers of Moody's Rating Books, asking for a rough estimate of the total amount of outstanding governmental bond issues, but they were not prepared to venture an estimate. Mr. M. N. Blakemore, vice-president of the company, in a very courteous letter, said: "It is very difficult for us to make an estimate of the grand total of all government bond issues as you request."

The statement has been made elsewhere, however, that the domestic bonds of our various governmental units, now outstanding, total between *Thirty Billions* and *Forty Billions* of dollars.

The great majority of these bonds have many years to run. Looking through the pages of the Moody Rating Book, one encounters again and again maturity dates of 1950, 1960, and even later.

According to this authority, the domestic debt of the United States Government, covered by interest-bearing bonds, amounted on April 30, 1922, to the stupendous total of $22,954,730,525.

The Bank of North America, located in New York City, has recently sent me a copy of its booklet entitled, "A National Survey of State Debts and Securities." An examination of this booklet shows that all our states are in hock in varying degrees, with the exception of Kansas and Nebraska. It is probable that soldier bonus legislation in various states has materially increased the outstanding indebtedness as shown by this survey. Illinois, for instance, is about to borrow $55,000,000 to provide funds to pay the bonus which was authorized last December. This will increase the indebtedness of Illinois five times the amount now outstanding.

Billion Owed by States Alone

THIS survey shows the various states in debt, as of 1922, to the amount of $1,071,506,981.28. This sum represents debts owed by the state governments only.

All this indebtedness is represented by interest-bearing bonds, with the exception of that of Kentucky and Wisconsin.

Even little Hawaii has got into the swim, with a bonded debt of $13,299,000, with Porto Rico as a close second, boasting a bonded debt of $12,146,000. The Philippine Islands, however, have them both badly beaten, the little brown men having run up a debt of $46,625,000.

The District of Columbia, containing the National Capitol and the White House, was, on December 31, 1921, in hock to the tune of $4,874,700.

It should be remembered that the tremendous and appalling indebtedness of the municipal government is quite exclusive of school districts, park districts, and other independent taxing bodies. For instance, the Chicago Park Districts have a separate indebtedness of $12,800 250, while Cook County, with which Chicago is merely coterminous, has an indebtedness of $11,785,000. In Pittsburgh, Pennsylvania, the school district is responsible for a bonded debt of nearly $10,000,000, in addition to the municipal indebtedness. Various other cities have a separate "water debt."

It is indeed a poor burg nowadays that cannot boast a debt of at least $1,000,000.

When it is recalled that many states, such as Illinois, contain more than 100 counties, and that each county has the right to float bonds, it may easily be conceived that the bonded indebtedness of the counties throughout the country totals an appalling amount.

There is not time to discuss in this article the fiscal, economic, and political problems and controversies which the issuance of vast quantities of tax-exempt public securities has called forth. Suffice it to say that an individual may enjoy an income of millions a year, but if it is derived from interest on tax-exempt securities he need not pay a penny of income tax to the government. The question has lurking in it ominous possibilities. *One of the most potent factors precipitating the French Revolution was the presence of tax-free classes in the nation.*

And What Have Banks Given?

IT IS only within the past few years that this bond-issuing mania started and every year now sees another immense flood of such securites.

The vast majority of these bond issues are marketed through the great banking and bond brokerage institutions of the East.

Taking thirty billions of dollars as a conservative estimate of the issues now outstanding, we may quite naturally ask ourselves the question:

What did the banks give in exchange for the bonds?

Before answering this question, let us turn to one of the leading Year Books just issued for the year 1923.

Quoting from the report of the Director of the Mint, it says that the entire world's production of gold, from 1492 to 1920, inclusive (a period of more than 425 years), amounted to $18,100,874,536.

The total production of gold in the United States, from 1792 to 1921, inclusive, was $4,141,980,400.

The stocks of gold and silver in the United States, *including both coin and bullion,* in the year 1921, were as follows:

Gold.	Silver.
$3,294,909,763.	$619,725,982.

A grand total of *less than four billions.*

Yet the gold of the whole world had been flowing into this country ever since the war began.

An examination of the banking statistics in the Year Book shows some equally surprising results.

We are informed that the "resources" of all banks in the United States in 1921 totaled $49,671,390,000.

Nearly 50 billions.

"Individual deposits" in all banks, we are told, amounted to $35,459,155,000.

In other words, the "resources" of the United States banks amounted to nearly THREE TIMES the amount of gold produced in the whole world since Columbus planted his banner on San Salvador!

Again, "individual deposits" in these banks totaled about ELEVEN TIMES the total stock of gold coin and bullion in actual existence in the country.

Yet we brag that the country is firmly planted on the GOLD STANDARD, we profess to believe that there is no REAL MONEY but Gold, and we try to make ourselves think that somehow or other all our legal tender represents and could at once be converted into Gold, even with facts staring us in the face to convict us of our error.

From the same Year Book we learn that last year (1922) the total amount of all kinds of money in circulation in the United States was $8,178,602,408.

This was nearly THREE TIMES the amount of gold coin and bullion in the country, but only ONE QUARTER of the individual deposits in the banks, and less than ONE SIXTH of the total resources of the banks!

What, then, are the banks using as money?

There is but one answer—PAPER.

It has been shown from the clearing house returns that $1,000 in checks and drafts is in circulation for every $1 in currency.

The resources and deposits of the banks do not represent gold, except to a comparatively small extent. In a much larger measure they represent LOANS AND DISCOUNTS.

Then, too, banks that purchase United States Government bonds are privileged to issue national bank notes, which circulate as money. By means of this peculiar arrangement, the bigger the debt of the government, the more "money" for the banks. The government bonds are made the security for the banks' notes, for the benefit not of the government or of the people, but of the banks. The banks own both the interest-bearing bonds and the money based on them. Of course, no such privilege was extended to the little private owners of Liberty Bonds.

The Year Book already quoted gives the total of national bank notes in circulation as $758,202,027.

With these notes, a bank can buy state and municipal bonds, thus making one set of bonds pay for the other, without parting with the title to the first set, and so two bonds are made to grow in its vault where only one grew before!

The Ponzis, apparently, are not all outside of the banks.

Gold Standard—a Fiscal Farce

THE Constitution of the United States gives Congress the power to "lay and collect taxes . . . . to pay the debts and provide for the common defense and general welfare of the United States."

The Federal Constitution likewise gives Congress the right to issue money which shall be legal tender. It is estimated that the total physical wealth of the United States is at the present time approximately $250,000,000,000.

With such immense natural wealth at its back, it is difficult to understand why the country should have to go into hock to Wall Street to raise the money to pay its current expenses of government.

When our national and local governments go to the big New York banks to borrow money, they pledge the tax-yielding wealth of the country or of its political subdivisions, as security.

We have shown, however, that the "money" that the banks loan is mainly PAPER.

In return for the loan of this PAPER, the unborn generation is taxed to pay interest, and the annual interest charge on these loans is already mounting to staggering figures. Posterity will have to pay the big end of the bill.

Surely, if there was ever a case of TAXATION WITHOUT REPRESENTATION, we have it here.

This floating of government interest-bearing bond issues through the banks is a direct result of the maintenance of the fiscal farce known as the GOLD STANDARD, for the profit of Wall Street.

The fact is that the country is not doing business on GOLD, but on PAPER, as any standard textbook of credit will prove. It is only by an economic hocus-pocus that the myth of the Gold Standard is kept alive.

We have shown (1) the magnitude of the physical wealth of the nation, and (2) that the Constitution gives Congress the right both to lay taxes and to issue legal tender money.

Why, then, should the national government, or any state, county, municipality or school district, crawl upon its knees to Wall Street to borrow gold—and get paper—for the use of which the present and future generations must be grievously taxed to pay interest?

Let the national government issue a currency broadly based on the splendid physical wealth of the country, instead of a sham currency resting like an inverted pyramid on a small bar of yellow metal and in constant danger of toppling over on our heads. Then there will be enough real money in circulation among the people to enable this generation to pay its own taxes and not sell its children into government bond-age to the Gold Kings of Wall Street for "a scrap of paper."

If Pizarro and His Band Were to Return

Centuries That Have Passed Have Left Few Marks in Land of Incas

By CARROLL K. MICHENER

This is the third of a series of travel stories by Mr. Michener.

PIZARRO and his men took pioneer toll of Peru's treasure and romance. They were the first tourists from overseas, and their predatory tread wore thin the Inca trails. They stripped the bloom of adventure from that remarkable domain.

A journey into the high Andes in those turbulent times—four centuries ago—was by no means a pleasure trip; and it is something of the same tale today, despite the rosy language of steamship folders. Notwithstanding Pizarro's early breaking of the way, the land is one of comparatively rude and unbeaten paths. Much history was written there subsequent to the Spanish Conquest, but it was of such a character as to repel rather than to invite the leisurely footsteps of holiday-makers from abroad. And not until the opening of the Panama Canal did the tide of tourist and commercial travel set strongly along South America's West Coast. Such traffic has been less voluminous than the more enthusiastic of the Pan-American folk were glib in predicting, but there is at least enough of it to promise this Egypt of the Western Hemisphere an increasing *turista* harvest.

The Plaza de Armas, Arequipa, Peru.

Before the full crop of such business can be reaped, however, it will be necessary to soften some of the asperities that now contribute so largely to the adventurous and somewhat pathfinding nature of West Coast travel. Recollection of the hotels, the cobblestones, the aromas, and some of the means of transport—such details of existence as most magnify themselves to the unaccustomed—is sufficient to convince at least one of a certain two of us that any wayfarer through the old land of the Incas, even at this present day, well merits the title of conquistador.

Sea captains and seasoned commercial travelers, as might be expected, are blasé concerning this West Coast. There is nothing to be seen, they say, between Panama and Valparaiso. When land is visible at all from a steamer's deck it is only an undulating smudge of bare foothills, with rarely a glimpse of the white-garbed Andean giants behind. And as for the ports, they are described as dingy, iron-roofed abiding places of desiccation and ennui, hardly worth the inconvenience of going ashore to see.

This is an external and unimaginative estimate. Sea captains and commercial travelers are not likely to paint such a scene with the color of fancy. But it was easy for us to agree with them, at least, that the avarice of Francisco Pizarro and his mates must have been great, indeed, and the tales of Inca gold fabulous, to have led them inland beyond Peru's genuinely inhospitable front door.

It is not recorded, of course, that Pizarro gave much attention to the beauties of land or sea, during his turbulent struggle for Inca treasure. At any rate there was little choice in the matter of a pleasing site for his capital. The coast everywhere was the same monotony of gravelly wastes and brown, twisted hills, rarely refreshed by the green of vegetation. The mountain plateaus were frigid and remote.

Inauspicious in its setting, great, nevertheless, must have been the splendors of Lima, Pizarro's "City of the Kings." Prescott, the historian, whose "Conquest of Peru" gave renown at once both to himself and the Incas, had it so though his portrayal, from the distant observation post of his Boston library, has deserved some discounting. Many of these splendors remain, but they are poorly heralded by squalid Callao, the seaport, with its unkempt Chinese shops in garbage-littered streets.

Dust assailed us fetidly from its lurking places among Callao's cobblestones, defying the feeble efforts of the city's street sprinklers—Standard Oil tins strapped to the backs of burros. Dairies peripatetic—cows and goats driven to a customer's door and there milked—gave the place some of the primitive quality of a Chinese village. Street merchants added to this similitude with their germ-sugared cakes and their sheaves of lottery tickets. On guard, with a lugubrious significance, was a police force of vultures, perched upon housetops, church towers and garden walls, nodding over their self-appointed business as the city's scavengers.

An electric street car line leads from the unpleasant human odors of Callao and the pervasive bird odors of the neighboring islands, through a flat, ascending valley. Dust-smirched trees and vegetation do their best to relieve the surface desiccation, and give evidence of the soil's fertility when subjected to irrigation. Lack of rainfall along the whole of the Peruvian coast is legendary and formed a subject for dining-salon conversation all the way down from Panama. Next to the Southern Cross, Panama hats, the mountain sickness, and the prevention of and remedy for fleabite, it is one of the most pungent of the little subjects that have power to charm the tourist breast.

Lima's mud-and-bamboo Cathedral is venerable with its 400 years, and the University dozes proudly under its consciousness of being the oldest seat of learning in America. Still, the city is peculiarly lacking in such majesty and circumstance as would befit an ancient repository of pomp and power. Houses are low, streets straight and narrow, and the shops unpretentious. The central *plaza,* flanked by the Cathedral and the old Spanish palace of colonial days, exhales something of an air of departed glory, but such a conjunction of established Iberian institutions—a square, a church and a public building—can be claimed alike by almost every hamlet in the Spanish world. There are rewards, however, for the patient inquisitor: glimpses of old colonial mansions wearing the airs of cloaked viceroys, cloistered walls exuding the monastic chill of the Middle Ages, and long vistas of Moorish balconies still retaining the impression of romantic charms.

Old Spanish balconies that hint of the traditional splendor of Lima.

A member of the street-sprinkling department of Arequipa.

A modern aspect of the business section of Lima.

One thing we missed, as will most others who have read overmuch of "cloaked shapes, the twanging of guitars, a rush of feet, and rapiers clashing"; we saw no *novio,* garbed like a Spanish troubadour in tight black velvet and red sash, singing his love songs before a grated window half revealing the dusky beauties of a shy *Limeña.* Such romantics appear to be almost as near extinction as South America's fawn-like vicuña, first cousin of the llama.

Neither were we startled by the sudden sound of revolutionary muskets, nor the news of an assassinated president. These excitements, too, are rarefying, as the state of society gradually changes politics from a professional sport to a popular pastime with rules better understood and better observed.

Old as the city is in both years and events, Lima has little historical atmosphere. There is a startling possibility, of course, that this is because of an almost total absence of that individual, at once malefactor and benefactor—the tourist guide. The city, at any rate, does not exploit its past. In a sense, it is still of the past, proud yet negligent of its renown.

No municipal signposts seduced us into the legendary footsteps of Almagro, Alvarado and the Pizarro brothers. Neither were we inspired by the ballyhoo of a sight-seeing bus to engage in pious pilgrimage to the spot where Atahuallpa, the last of the Incas, after ransoming himself with a pyramid of gold stripped from the nation's altars, was executed—for Spanish expediency—upon the convenient charge of conspiring to effect his own liberty.

A certain species of guide we encountered in the Cathedral, a shifty, mumbling creature—member of the International Order of Shrine Parasites—who showed us the mummy of Francisco Pizarro, conveniently exposed within a glass case. He had not the enterprise, however, to lead us to the white marble slab, upon a pavement in one of the government buildings, marking the spot where this master freebooter, the "swineherd of Estremadura," was cut down by the swords making the sign of the cross of his jealous countrymen, with his own blood as he relinquished the ghost.

The old trains to the high Andean plateau, which was the Inca stronghold, were overland from Lima. Today the easiest route is by rail from Mollendo, an uninspiring, drooping huddle of gray houses clinging to a brown foothill along a shelterless coast.

One of us spent anxious and almost backsliding moments over the report that steamer passengers at Mollendo were frequently hoisted out of the ship by means of block and tackle. The sea was mild, however, and no such heroics were required. It was only a matter of convenience, rather than one of necessity, that led to our being lifted ashore "in a basket" when we arrived at the landing. A careless donkey engine and an irritable derrick whisked us aloft in a rude chair and set us breathless amid heaps of baggage, merchandise and Peruvians.

When the dull delights of Mollendo had been exhausted we struggled into the daily train for the interior, together with flat-hatted priests, *mestizo* persons of mixed ancestry who were dignified for the moment by shoes and shirts, and perspiring *hidalgos* on their modern knight-errantry of politics and business.

A dust storm sped us over the flats that lead between sea and hills into an ascending valley. Then a thinly green, checkered bowl of fertility uncovered itself in the midst of the desert, remaining visible as a refreshment to the eye until the train had curved and counter-curved over the first foothills. Frequent stops to revive the engine, and to traffic in Peruvian and aboriginal passengers, gave us an opportunity of inspecting the small villages along the way, each an oasis of greenery in the midst of general desolation, exhibiting no particular reason for existence.

One of us succumbed to the tempting, conical baskets of grapes, strawberries, peaches and figs offered at the

(Concluded on page 15)

Divorce Statutes Veritable Joseph's Coat

As Many Varieties of Regulatory Legislation as There Are States; Laws Make It Possible to Become Married "With Reservations"

By CARL SCHURZ LOWDEN

This is the second of three stories by Mr. Lowden. The third will appear in an early issue.

TWO persons, a man and a woman, sat in a room of a lawyer's office in one of our big cities—it really does not matter whether it was San Francisco, St. Louis, Baltimore or elsewhere. They were at ease, that is, not agitated yet fully determined. The attorney twirled his thumbs, perhaps without being aware of the act.

"Now, George," said the man, "can you help us? We came to you because you and I were both in the line of our college team and because she watched us from the big stand. We've tried getting along for six years, and we haven't made a 'go' of it. There isn't any serious trouble, but we want to quit. We were not intended for each other. We made a mistake. Neither of us is infatuated with anybody else, but each of us has just one life to make or mar and we want to stop the marring process."

"Well," answered the man in the swivel chair as he swung around, "have you ever struck Ethel?"

"Never."

"Been unfaithful?"

"No."

"Deserted her or failed to provide?"

"No."

"Well," the attorney concluded, "I know that you have not committed a crime, and I know that you do not drink and therefore could not be guilty of habitual drunkenness for two years. Ethel has no grounds for a divorce. As for you, if Ethel has not offended as suggested by the questions, you are out of luck, too. I'm pretty sure I can't represent either of you without exposing myself to disbarment proceedings."

So She Alleged Cruelty

WHAT could they do? The attorney, old friend that he was, proved evasive because he believed in the ethics his profession is supposed to have. However, the dissatisfied couple ascertained that they might stage a cruelty scene on three occasions with an ample number of witnesses present, or they might manufacture the evidence out of whole cloth; in either case the use of money would make the way easier. Desertion would entail a delay of two years. They might do as they do in England where only one ground for divorce is recognized, and stage scenes of unfaithfulness; but that method can never appeal to any one with culture. Now, which did they use? She alleged cruelty; and so it happened that the divorce was granted eight months afterward.

In a western state there lived a minister who seemed single, but he was not. No one ever saw him with his wife; and none of his parishioners ever saw her. In fact she lived apart from him in a certain hospital or asylum for the incurable insane. His state did not permit divorce on the ground of insanity and, as a matter of fact, he had never contemplated applying for it with any charges whatsoever.

At a convention in the East the minister met a woman who could bring brightness into his life. Hers had been dull and dreary, too. It seemed that together they might have achieved a wonderful happiness had they found each other sooner. He had a standard of ethics whereby he would not consider establishing a residence in some other state for the purpose of freeing himself. Many years passed. John waited. Mary waited. Then one fateful day Mary received a telegram announcing John's death from heart failure. That was the darkest day she ever experienced; the world fell down about her ears. Mary is a matronly sort, she loves children; and yet it is not likely that she will ever wed.

Wed 50 Years, Seek Divorce

RECENTLY a woman who had reached the age of 72, and lived with her husband more than half a century, filed suit for divorce. She charged cruel and inhuman treatment, also that her husband was too lazy to provide a sufficient living. The case has not yet come up for a hearing.

Why should this aged couple fall out after celebrating their golden wedding? Psychologists could explain it all. They had come to their second childhood; as children are more sensitive than their elders to their environment, so were these "children." Through the years the wife had suppressed her resentment to the habits of her husband; but at last her long pent-up emotion broke out of its hiding place to manifest itself in the filing of the suit.

Thousands of married persons are smoldering volcanoes. Slights, little injuries, pile up; certain antipathies develop, and some day the family finds itself imperiled by a Mt. Vesuvius. Peacemakers rarely accomplish anything of a permanent nature in this kind of a deplorable situation.

Now there are two general views that may be taken regarding divorce: it is a great blessing, or it is a great evil. Assuredly the evil consists of its abuse. The blessing comes when divorce serves to untie mismated persons bound together and thereby provides to them another opportunity to locate the "just meant for each other" for whom every man and woman is searching or has searched. The personal equation is everything in determining whether divorce should be held a curse or a blessing; the right-thinking man or woman will be conscientious invariably, but the other sort will prove otherwise just as invariably. However, divorce as an institution is not an evil.

I could go on presenting "case reports," as a physician would call them; but I shall not. They would be too disheartening to a world already too sordid. Let us look for the good instead.

Our states regard insanity in a varying light. Most of them do not consider it a sufficient reason for ending marriage; only nine, and the District of Columbia, do. New Jersey mentions idiocy as a proper cause. Of the states that do recognize insanity, some specify that no divorce may be obtained on grounds arising in another unless they constitute cause for divorce in the state where they arose; this regulation prevents all evasions.

A veritable hodgepodge are our state laws on divorce, so much so that Uncle Sam might well be thought of as arrayed in Joseph's Coat which comprised a medley of colors. Take cruelty, for example. Some of our commonwealths aver that the cruelty must be of the extreme type; others couple it with "inhuman treatment" as if "cruelty" is not broad enough to include the longer term. One employs the phrase, "violent temper," while two others produce variations with "ungovernable temper" and "vicious conduct." A total of 45 states and territories admit cruelty as a proper justification of an action for divorce; but in only a few of them would rasping, nagging or fault-finding, little in each incident but big in general effect, be considered as a good and sufficient cause.

There are certain grounds that may be classed with cruelty or as akin to it. Eight states have legislated against "indignities" which others include under "cruelty and inhuman treatment." Texas names "outrages rendering life together insupportable" and New Hampshire uses the wording, "treatment endangering health or reason." Louisiana lists "public defamation," perhaps better known as slander. Exactly one-sixth of our total of states have written "neglect" into their statutes; and four or possibly five of these specify that it shall have continued through one year or more.

Declare Against Drunkenness

FORTY states have declared against "habitual drunkenness" and some of them put narcotics and habit-forming drugs under the ban. If we ever get to the point of classifying tea and coffee as drugs, we may expect the divorce courts to be overwhelmed; and if we include tobacco, there will certainly be an increase in wifeless husbands. In 20 years we have been going at a rapid rate; and I recently noticed the statement of an expert in figures that in 10 or 15 years the divorces and legal separations will equal the number of marriages. But I don't really believe that a whit more than you do.

Seriously, however, drunkenness is no laughing matter. Picture the brute of a man who thinks more of his own satisfaction and appeasing his own appetite than he does of providing for his wife and children. He squanders his money on himself. He is a degenerate because he is willfully ignoring his marriage vows.

"Failure to provide" is mentioned by nearly a score of states as a proper cause for the institution of a suit. Though a majority of the states ignore it as a cause, more divorces are granted for this reason than for any other. The action will invariably be based on something else which is, in fact, the effect.

Consider the situation. A young man and a young woman, both of whom have been working, marry. He has been supporting himself and saving a little, and she may have been doing the same. She gives up her job and they try to make ends meet with his wages alone. Meanwhile they will not lower their tastes or make any material retrenchment; bankruptcy of the home is the natural result, the thing that might have been expected if their love was not deep enough for sacrifices.

You have seen advertisements of hair tonics with heads showing "Before" and "After." Well, the wife who finds her dresses and hats getting shabby and no new ones being added to her wardrobe contemplates the "Before" and "After" of her wedding day. She becomes discontented with her lot, and then it is that temper manifests its presence. Quarreling ensues. She probably goes back to her parents. Sooner or later she brings suit, charging cruelty and perhaps not mentioning her mate's failure to provide adequately for her.

The wife may nag. The husband will grow disgusted with her lack of sportsmanship or palship. When he married her, he may have thought they would win together or go down together if hardships were their lot. He does not find the unswerving loyalty he expected; so he ceases to care, and he leaves her society for that of a woman who does not scold everlastingly. She has made no effort to keep his love.

Seeing herself forsaken, she may do likewise; and there may be both "another man" and "another woman," a mutual unfaithfulness.

Now, strange as it may seem, only a few of our states recognize adultery as a just cause. New York will grant a divorce on that ground alone and on no other except that the marriage may be annulled for causes that rendered the relationship void from the beginning. Thinking persons quite generally agree that this law is much too narrow and that a state, so progressive otherwise, should not be so antiquated with regard to its statute upon divorce. Virginia says that a husband may institute action on the ground of prostitution. West Virginia declares for the single standard by mentioning prostitution and also the licentiousness of the husband.

We may not relish conditions here in our own enlightened United States, but they are better than those prevailing with our neighbor on the north. There in Canada the laws are patterned after those of old England which, like New York, can conceive of only one justifiable cause.

"Women in this country," says Justice Galt, of Winnipeg, "have been placed in many respects on the same footing as men. They have been given the franchise. It is difficult to see why any different rule should be applied to a husband than that applied to his wife in deciding upon the question of misconduct.

No Divorces in South Carolina

"WHY a woman should be obliged to consort with a husband who has committed adultery while the husband can get rid of his wife on that ground alone, is a peculiarity of law which does not seem creditable in a civilized country. But these are matters which should more properly be decided after full argument by both parties to the proceeding."

The divorce law of Manitoba makes it necessary for a wife to name both adultery and cruelty in her application and to prove each of them before it can be successful. A husband, however, fares much better; he is required to prove either of the grounds but not both.

New York may seem severe, but its severity is nothing alongside that of South Carolina. There is only one state where no divorces whatsoever are granted, and South Carolina happens to be it. Evidently the state aspired to be strictly moral; but too much strictness usually defeats its own end. Human nature is human nature, and neither a state nor a nation can force people to ignore their instincts. The severity of the restriction leads to badness rather than to goodness.

Nearly all our states and territories give cognizance to abandonment; but their comparative unanimity in that respect does not extend to the duration or length of the offense. Twenty-two deem one year as sufficient, 12 think the time should be doubled and 11 triple it. North Carolina says a divorce may be applied for if the parties have lived apart 10 years and had no issue; and I might mention here that in 41 states childlessness is a valid ground.

"Try It," Their Reservation

THE matter of residence qualifies as a moot point almost as universally as abandonment. Three states and the District of Columbia specify three or more years, 11 have declared for two while 33 name one year. Idaho and Nevada, particularly the latter, continue to be divorce meccas because they require the shortest residence, only six months; it has become fashionable, however, for wealthy couples to go to Paris where they can spend money faster and have to stay no longer than in Reno whose social advantages are not all that they might be.

An even two score of our states incorporate crime or felony in their list of causes; eight include imprisonment and specify various lengths of sentences under which this action may be taken, but Connecticut will not allow divorces on this ground unless the defendant is a "lifer." Virginia has legislated in favor of the person whose mate has been throughout two years a fugitive from justice.

Annulment or divorce is permissible in half a dozen states upon the submission of proof of consanguinity or marriage within the restricted degrees of relationship. Nine states break the marriage tie in cases covered by "want of age." In Kentucky the wedded person who joins a religious sect that believes marriage unlawful, exposes himself to divorce action.

The fault of our present divorce hodgepodge lies in the comparative ease of obtaining dissolution of the marriage bond. Men and women enter marriage with reservations. "If I don't like my mate," they tell themselves, "I'll get another."

Declares America Building Literature of Her Own

Hugh Walpole, English Novelist, Finds Distinct School of Fictionists

By FRED L. HOLMES

"NATHANIEL HAWTHORNE is the greatest novelist America has produced. Even though he followed the tone of the English writers of his time, there is much that makes his works stand out significantly in American literature."

Sitting on a little wooden chair in a cramped hotel room, with clippings from press services spread over the counterpane of his narrow mahogany bed, Hugh Walpole started to tell some of his impressions of America and American literature. The first bouquet went to Nathaniel Hawthorne. So much had been told of Mr. Walpole in magazines that the reporters from college papers and daily publications crowded his room as if to see some new curiosity.

Despite the entertaining stories which he has related of his own timidity and awkardness as a youth and in college, Hugh Walpole, now 39 years old, looks like a driving, resourceful football star, of 20 years ago, grown to manhood. Tall, strongly built, square-shouldered, clean-shaven, there is every mark about him of a powerful physique. He has the mannerisms of a college man, rather than a philosopher. The prominence of his forehead, a determined lower jaw, a zest of life, and optimism of speech and a boyishness of smile, make him a captivating personality.

Most of all, he seems to enjoy American life. He relished the questions fired at him by immature college interviewers, as if he were engaged in a game of chess. He carried them into a labyrinth of philosophy and then came back with homely comparisons, and apt illustrations which make the onlooker feel that after all he could be serious following a lark. Mr. Walpole has been making his second tour of the United States. He lectured throughout the country in 1920 and came back on invitation of colleges and universities, who wanted to get their students in closer range with this rising literary star in the English firmament, already resplendent with the light of Chesterton, H. G. Wells, Galsworthy and Conrad.

The American Atmosphere

"I THINK American literature practically begins with O. Henry," he went on after he had discussed the habits of Americans, and many other observations gained from his tour. "O. Henry was a wonderful American author. He used American material, spoke in a language characteristically American and he never wrote about anything that was not American. Within the past few years, Americans have built up such a distinct literature, that it requires a glossary of terms, when these books are now republished in Great Britain. Only recently 'Babbitt,' by Sinclair Lewis, was issued in England with a full key to words that are distinctly American.

"The earlier American writers had no such American atmosphere in their novels. James Fennimore Cooper, writing of scenes in America, nevertheless had a spirit and tone that was not unlike many of his contemporaries in England. One could not tell from reading his sketches, if he did not know, whether Washington Irving were an English writer or an American.

"With the exception of Walt Whitman and Mark Twain, up to 20 years ago, American literature had no distinctly American tone, in words, in thought or description.

"The change seems to have come with O. Henry. Then followed a score of writers, including more recently, Sinclair Lewis, Joseph Hergesheimer, Willa Cather, Heywood Broun, Carl Van Vechten and others—all American. Such writers have made a literature for America as distinct as that of the Spanish, French or Italian.

"There seem to be two contending forces in American literature. One would measure all by the yardstick of money values. You have magazines that talk only of success, of men who have made money. They are striving against a group, more concerned in elevating the human elements—the soul of justice, the garb of true character.

"I seem to have seen a change within the last three years. Most of the American writers rebel against the present conditions of American life. They are bold in their criticisms. Their following is increasing. Which group will ultimately win, I cannot tell."

Conversation paused for a moment. Then there was a question about social classes in England compared with America.

"You have so many rich men in America," he answered, as if marveling at the thought. "Over in England the very rich are very few and those do not rank nearly so high in wealth as many Americans. There we have a number of other estimates by which to value a man besides the money estimate.

"In America you have many exclusive sets. We mingle our sets so that we have interesting people of every sort in them whether they be rich or poor. I notice the very rich here do not mingle with others and a very poor man cannot belong to a rich set. In England the poor novelist, actor or inventor is welcomed to society for what he is attempting to do. In the true meaning of the word, there are not many poor men in America. The man who cleans your street seems to have more money than our doctors or lawyers at home."

"What characteristics of American life have left a distinct impression upon you?" was the next question ventured.

"There are three," came the reply, as if he had long been waiting an opportunity to register his protest.

"First—the drinking of bad liquor. The prohibition law should be enforced, or there should be an amendment, which will not make so many men hypocrites. The present condition is quite impossible.

"Second—dirty bits of paper and scraps that you leave lying in your streets and in your dooryards. I do not see why people are not forced to do their part in keeping their cities clean. I think it is a shame. I once asked a man why this condition was tolerated in this country and he told me it was because there was no labor to do this work. I replied that I could not think it was a scarcity of labor, but that if every owner would do his share to keep his yard and his street clean, that was all that would be necessary. But the ugly condition still persists.

"Third—the advertising signs one sees all over the country. I have been told that nothing really increases business like these mammoth advertising signs, about your depots, at the intersection of your streets, in vacant lots, and on the highways of traffic. I do not like to see these display signs spoiling your wonderful and marvelous scenery.

"I like the little white colonial cottages which have multiplied so rapidly in this country within the past three or four years. They are artistic, with their green blinds and shrubbery, and give the American home a distinct individuality."

Gifts of a remarkable geniality and versatility, and courageous viewpoint have been the characteristics of Walpole's ancestry, and he has inherited them. He belongs to a distinguished English family, being a descendant of Sir Robert Walpole, the famous British Prime Minister of the eighteenth century, and of Horace Walpole, the writer and wit of the late Georgian period. Hugh Walpole was born in Auckland, New Zealand, in 1884. His father, the Right Reverend George Henry Somerset Walpole, D.D., bishop of Edinburgh since 1910, had been sent to Auckland in 1882 to have charge of St. Mary's Pro-Cathedral. At his age of five, the family was transferred to New York, where the father was a teacher and lecturer at the Union Theological Seminary.

Before he was 10 years old, the boy was sent back to England to obtain an education, the family remaining in New York until 1896, when it returned. Young Walpole has left a dark, depressing, doleful story of the two years of his English education in the absence of his parents. Because of his timidity, his shrinking, bashful disposition, the students played all sorts of pranks upon him.

A Cambridge Graduate

"I DID not stand up for myself then, and I am not trying to stand up for myself now," he recently declared in telling of these early days at the boarding school. "The point is exactly that I was a miserable child, a prey to every conceivable terror, so that the banging of a door, or the dropping of a book sent my heart into my cranium, sentimental, too, like a little dog fawning on anyone, who was for a moment kind and—worst of all these, I think—muddle-headed and confused beyond any grown human's conception. I went to this school with a very fair intelligence. Mathematics I never could be able to understand; to this day I count on my fingers, but history and geography and literature, I was nosing into like a pony with a bundle of hay."

Soon after the return of his parents, they discovered the carelessness of the school's practices, and transferred him to other institutions to complete his education. He took high honors when he graduated at Cambridge and for a few years thereafter was engaged in journalism.

"That cheery proclamation of octogenarians that there is no time like youth is one of the falsest things in the world," declared Mr. Walpole in describing the trials of his boyhood. "I can say now at 39 that every year of my life has been happier than the last. Most of my unhappiness during my years from 12 to 18 was my own fault; but I didn't know how to change it. I only knew that I was awkward and in the way, like the young calf who has strayed into a ladies' tea party."

During one year he was employed in Liverpool at the Mersey Mission for Seamen. He felt for a time that his ingrained knowledge of religion fitted him peculiarly for the task before him. But he found the missionary work, calling on the rough seamen on the boats, worse than irksome. He shunned it. It was while in the midst of these apparent disasters and failures that he began the writing of a novel. All night long he worked upon it—his first lesson in novel writing.

"About this time, feeling ecstatic over my literary triumph, I was summoned by the chief of the mission," explained Mr. Walpole. "He said that I had been absent-minded; that I had not visited all the ships as directed; and that he did not feel that clerical work was my vocation. With the vision of all of the characters in my growing novel in my mind beckoning to me, calling, I had to agree that he was right. I went down to the river to see the flood tossing its grey froth, gulls wheeling with hoarse screams above my head; people crowding past me. I had decided that the mission chief was right. So I went back and resigned my work, hungry to become a novelist."

HUGH WALPOLE,
Distinguished English novelist who says America now has a distinct literature.

Tait Prize Twice

OF MORE than a dozen novels that have been written by him the best known are: "The Young Enchanted," "The Thirteen Revellers," "The Captives," "Jeremy," "The Secret City," "The Green Mirror," "The Dark Forest," "The Golden Scarecrow," "The Duchess of Wrexe," "Fortitude," "The Wooden Horse," "Maradick at Forty," "The Prelude to Adventure," "The Gods and Mr. Perrin" and "The Cathedral."

For the best novel of the year, the University of Edinburgh has twice awarded the Tait Black Prize to Mr. Walpole—first, for "The Secret City" in 1919 and then for "The Captives" in 1920.

Grant Overton once said that the tendency to live away from home and travel enjoyed by Mr. Walpole in his youth has clung to him through life. One may write to him in London and receive a reply sent from Chicago, or some place on the Continent. A large part of his time each year is spent by this bachelor-author in traveling.

More recently Mr. Walpole has outgrown a strange superstition. He always began his earlier novels on Christmas Eve and regarded this as so favorable an omen for years that though he might be bubbling over with inspiration, he would delay the commencement of his task until the Christmas gloaming. This strange custom has been abandoned recently.

Unlike works of so many other novelists, there is no fixed general locality forever appearing and re-asserting itself in Mr. Walpole's novels. Russia, Cornwall and London are all familiar to him. Two of his better known novels were written as the result of his World War experiences in Russia. Mr. Walpole served with the Russian Red Cross and later was sent by the British Government on an important mission to Petrograd. Out of this service came "The Dark Forest" and "The Secret City." He declares that he wrote them to capture an atmosphere of a crucial period in world affairs which would escape if not depicted at the propitious moment.

"These books have called down on my back a cartload of troubles," he continued "All kinds of people who read these books demanded of me a knowledge of Russia which I never for an instant possessed. On the other hand, I am often quoted as an authority among people who know very well of my ignorance of many matters pertaining to Russia."

From a discussion of his books, Mr. Walpole was brought to a consideration of political and economic affairs. He does not believe that the advent of woman suffrage will have any marked effect on the literature of the country.

Woman's greatest work can be accomplished through social activities, rather than in politics, in his opinion.

"Don't quote me on American politics," he declared in parting. "I don't seem to understand the *difference in the parties.*"

Dr. Abrams' Machine Worthless Contraption

Concluded from page 3

meter for the measurement of the dosage of the X-ray, and of an improved form of fluoroscope. He is one of the leading electrical engineers and experts of the Pacific Coast. When the writer got in touch with him, he was just beginning his study of the Oscilloclast, *the first scientific study ever made of any one of the Abrams machines.*

The Abrams Oscilloclast is presented to the world by Dr. Abrams as a machine which, if properly used, will cure all diseases, and which is especially effective in the treatment of syphilis, cancer and tuberculosis, the three diseases for whose treatment large sums can be most easily collected from ailing humanity. The Abrams Oscilloclast, according to its inventor, cures disease by giving to the patient electric vibrations—at a rate determined by the diagnosis as rendered by other machines invented and sold by Dr. Abrams. These vibrations, carried on the electric current which is supposed to pass from the ordinary electric light socket through the Oscilloclast and into the body of the patient by means of an electrode (price, $6, cash) invented and sold by Abrams, are supposed to nullify the erroneous vibrations of the electrons in the diseased area within the patient, and thereafter set up the correct vibrations which re-establish the patient's health.

Shorn of the technical wording which Mr. Rieber has used in his report, the investigation showed four important results:

1. That no current appreciable to the most delicate galvanometer passes from the Oscilloclast to the patient. Since the vibrations are carried by the electric current, it is obvious that no vibrations pass from the Oscilloclast to the patient.

2. That the construction and the wiring of the interior of the Oscilloclast is such that no electrical current could pass through the machine, and that this wiring and construction shows a profound ignorance on the part of the inventor of all the laws of electricity, or of the handling of the electric current.

3. That the only possible result of the application of the electric current to the Oscilloclast is the turning over of the armature of a small motor, and the rotation of a small current-breaker, which is belted to the shaft of that motor, both of these having been purchased by Abrams from the common stock of an equipment store, and installed on the outside top of the Oscilloclast.

4. That there is more electricity in a handshake, or in the "laying on of hands," than is delivered by the Oscilloclast. That is to say, the ailing human body would receive more vibration, and a greater quantity of electricity, from the work of a competent masseur, using one hand, than it would from a whole battery of Oscilloclasts.

In this test, we gave the machine every advantage. It was first connected with a 110-volt electric light socket as directed. The motor ran, and the current-breaker turned. Then, a very delicate galvanometer was connected to the Oscilloclast, and, with motor running, an effort made to determine the amount of current administered. The galvanometer needle never moved. A "patient" was connected in the proper place with the Oscilloclast and the galvanometer, and again there was no record of any current, even when the "maximum" capacity of the Oscilloclast was given to the patient. In other words, scientific investigation could find no means whereby the Abrams Oscilloclast could have any influence whatever, either good or bad, on a person subjected to "treatment" by it.

Mr. Rieber's report to me, under date of January 30, 1923, is as follows:

"In accordance with your request, I have made in my laboratory a few tests to determine what type of energy, if any, is given off from the Abrams Oscilloclast.

"This instrument is provided with a flexible cord and standard plug terminals adapting it to be operated from a source of 110-volt alternating current. No polarizing device is provided on the input plug, so it is presumable that the instrument is intended to operate regardless of whether one or the other of the input terminals happens to connect with the earthed or grounded side of the 110-volt supply line. Tests were, however, conducted first with one side of the supply line grounded, and then with the other side of the supply line grounded so as to offset this possible source of error.

"As the instrument employs a wire leading from the binding post on top of the case to an electrode applied to the patient, it is presumed that electrical energy is intended to flow along this wire from the instrument to the patient. This presumption is made because the instrument is supplied with electricity as a source of operating energy, and the only practical means of conveying any of this energy to the patient would be to have electricity of some form flow along the wire leading to the electrode. There are only two types of electric current that could possibly flow on this wire. The first type would be direct current, which flows continuously and smoothly in one direction. However, the effects of direct current are all very well known, and none of them correspond to the claims made for this instrument. Further, the very name of the instrument, 'Oscilloclast,' can only be translated roughly as 'an instrument for destroying by oscillation.'

"It is, therefore, presumed that the second type of electrical energy, namely, 'oscillating,' or 'alternating,' current, is intended to flow along this wire. As a detector for alternating or oscillating current of any possible frequency, it is possible to use a sensitive galvanometer, and a vacuum tube, such as is used in radio work. A combination of this sort was set up in the laboratory, and consisted of instruments known to be so sensitive that they would respond to the very minute radio current picked up from the local broadcasting stations. This sensibility was considered to be sufficient, *since if there is any effectiveness in transmitting electrical oscillation to the human body, the thousands of radio waves which traverse the ether daily would produce a continued effect on the bodies of all who come within their range.*

"The galvanometer and the vacuum tube were accordingly set up as illustrated in the photograph, *to intercept and measure any oscillating current that might be passing along the wire from the Abrams Oscilloclast to the patient.*

"The Oscilloclast was then connected to the alternating current and set in motion, and an attempt was made to measure the current delivered from the apparatus to the patient on every possible adjustment. The Oscilloclast is provided with a contact switch adjustable to a number of different points, also with a variable condenser, such as is used in radio work. The switch was set successively on each of the variable points, and, with the instrument in operation, the condenser was slowly varied through its entire range, while the galvanometer was carefully observed. The 'patient' alternately held the end of the wire in contact with his skin, or at a slight distance, since the electrodes used in the Abrams method of treatment do not always touch the patient's skin and form a direct contact.

Test of the Abrams Oscilloclast with delicate galvanometer, made in the laboratory of the Roentgen Appliance Corporation, San Francisco, California. This delicate instrument could find no electricity coming out of the Abrams instrument, which Abrams advertises and leases as a cure for all diseases.

"During the entire course of the experiment, **no observed deflections of any sort took place in the galvanometer system.**

"The galvanometer was then tested, and found to be operating at full sensibility. Thus, **if any currents had been present,** deflections would most surely have occurred.

"The only conclusion possible to draw from these experiments is that the Abrams Oscilloclast, as tested, **DOES NOT DELIVER ANY ELECTRIC CURRENT OF ANY KIND** to the body of the patient through the output wire.

"From an observation of the internal arrangement of the Oscilloclast, shown on the accompanying diagram, this is not surprising. Several of the circuits have no beginning and no end. That is, they are not complete, but terminate in dead-ended wires. There is, therefore, no place for the electricity to go on these circuits, and nothing it could possibly do if it got there.

"Further, the electrical system in the oscilloclast does not constitute any known means for either generating or utilizing the electrical oscillation. If the circuits employed have any purpose at all, this purpose is not of the sort to be evident to one familiar with electrical engineering or physical laboratory practice.

(Signed) "FRANK RIEBER."

The useless wiring of the internal parts of the Oscilloclast is well shown on the accompanying diagram, carefully drawn for the writer by the first electrical engineer to whom the Abrams machine was shown. Four closed circuits are visible in this wiring—with "no place for the electricity to go and nothing it could possibly do when it got there." Even the electrode which is supposed to be applied to the patient is a closed circuit, and if there were any current passing out from the Oscilloclast, all that the patient could receive would be what is known as a "capacity charge," which he would not feel.

In the language of one of the most prominent physicians of San Francisco, a man who is a leader at the largest hospital in the city, and who makes daily use of the latest electrical equipment, the Oscilloclast built and sold by Dr. Albert Abrams, "looks and works like a contraption built by a 10-year-old boy who knows a little about electricity to mystify an eight-year-old boy who knows nothing about it."

But though the Oscilloclast—built for $30 and leased for $200, with $5 a month additional until it wears out—is considered by Abrams to be his master "invention," this wily discoverer of the ERA has many other matters to his credit. Last December, among the scores of persons who called on him for treatment, or attended his classes, were five young men, each of whom was informed that he had syphilis in violent form. Though these young men did not know each other, did not visit Abrams in a party, and did not discuss with each other their misfortunes, each seems to have come to the same idea at about the same time, and that idea was that they should see some other physician before accepting Abrams' word.

They consulted three of the most reputable physicians in Oakland and in San Francisco. Applying the known and accredited tests, these physicians were unable to find any traces of this dreadful disease in any of the five young men. Then the young men told the physicians of Abrams' hideous diagnosis. The physicians thereupon, without informing the laboratory workers of their own tests, submitted each of the five young men to the closest and most delicate tests in the laboratory of the best-equipped hospital in San Francisco. All the tests gave negative results. Five men whom Abrams had informed professionally that they were infected with the most terrible disease known to man were found to have no trace of that disease.

It is impossible ever to know how many of these ailing human beings have gone needlessly to their deaths because of wrong diagnosis or useless "treatment." In 1922, the *Journal of the American Medical Association* devoted several articles to Abrams and an exposure of his methods, Abrams resigning in high dudgeon after these attacks, **but still refusing to submit his methods or his machines to fair and open tests.**

In fact, like most others of his race caught in various peculiar proceedings, Abrams has raised the cry of "persecution," in an effort to blind those seeking to learn the truth regarding his "discoveries" and his "inventions." He publishes, quarterly, a small magazine, descriptive and laudatory of his work, and used as a medium in which to advertise his apparatus, such as the sphygmobiometer and the Oscilloclast. In the issue of this magazine—"Physico-Clinical Medicine" — Abrams takes a fling at his critics under the heading "O Hell! What's the Use!" in which he declares that his attitude toward critics is contemptuous silence, because these critics' "conception of my methods is akin to that of a Swiss cheese sandwich replying to questions concerning the nature and composition of celestial bodies."

Abrams has just purchased a hospital in the business district of San Francisco, and is making additions to it to convert it into "a permanent home for ERA and Physico-Clinical Medicine." These are his own words. At present, however, he maintains himself in what was once a mansion at 2151 Sacramento street, San Francisco. This house is furnished with all manner of oriental rugs, hangings, images, masks, hidden doors and other mystifying trumpery. There the patient, or the visiting physician seeking one or more of the Abrams machines, is received by a girl at a telephone switchboard, who, after more or less mystifying telephone conversations with either a Dr. Fleeger, who appears to be Abrams' right-hand man, or the Heidelberg M. D., himself, admits the seeker after the latest medical knowledge, either to Dr. Fleeger or to Abrams.

The writer made four appointments with this girl, with Fleeger and with Abrams, for a demonstration of the latter's inventions, but, for some mysterious reason, which, perhaps, is not so far to seek, the discoverer of ERA failed to keep any one of them. Other investigators have met with the same effort to block investigation and to obscure the light of day. Then, too, Dr. Abrams is busy with a new invention—a love detector. This machine which has been presented to the people of the United States through the medium of a kindly and unsuspecting press, purports to discover with whom you are in love, just as soon as you submit yourself to being connected with the instrument. If, however, there is no more current passing through it than passes through the Oscilloclast, the writer rather fears that only unusually strong passions would record themselves upon it.

Dr. Abrams overlooks no opportunities. While inventing sphygmobiometers, pitch-ball diagnostic machines, Oscilloclasts, love detectors, and other similarly salable apparatus, he also conducts "practical courses in Spondylotherapy and Electronic Diagnosis and Treatment," at his office in San Francisco. To quote from his advertising: "Only reputable physicians and osteopaths can gain admission to the classes, which are limited. The course lasts four weeks, and the fee, in advance, is $250." The fees, as usual, are "in advance," and the attendance is "limited" to those who have the $250. A member of one of his classes informed me that this particular class had 37 members. At $250 each, for four weeks' instruction, this makes a "neat sum," does it not?

Yet there are hundreds of physicians holding in their hands the lives of thousands of the afflicted who, in these United States, in this twentieth century, are treating their patients under the guidance of such theories as these, and with such apparatus as the sphygmobiometer and the Oscilloclast. This is, indeed, a free country; free with human life and free with human humbuggery!

The Girl Who Lives in Glass Houses

MISS EDNA SAMPSON

Miss Sampson has no beauty secrets! Her maid gives her a Marcel wave, with the World and His Wife flattening their noses against the glass house. Scene taken in one of the four rooms represented recently in the show windows of the Meier & Frank Co., Portland, Oregon.

EDNA SAMPSON is a young woman who earns her living showing others how to live most comfortably! She does not do this by lecturing, writing serious articles nor through the medium of the motion picture camera. She merely lives, about six days out of seven, in full view of a curious and, in most cases, admiring public.

Miss Sampson is an actress of no mean ability, and has appeared in motion pictures with Harold Lloyd, but last summer, while visiting in Omaha, she agreed to help with a little window display work. She was to arrange a bathing suit display, and had it all planned, with a beach scene and girls in bathing suits. The weather turned cold, and, as Miss Sampson says, "The idea went cold, too," so, since she plays the piano, she decided to change the window to one demonstrating music, instead of showing bathing suits.

While she was doing this, it came to her that it might be a good idea to live right in the window for a number of days, using and advertising not only the piano, but the stove, rugs, books and equipment that the store carried, which was used in a real home. The idea caught among advertising men, and Miss Sampson has been living in glass apartments ever since.

The young woman gave the first real trial to her idea in San Francisco, and from there went to Portland, Oregon. She does all her own advertising, and carries on her correspondence with the stores in various cities where her act is to be put on, and personally looks after all the details. When she arrives, she goes through the store, choosing what she wants in her apartment, until it is quite completely furnished, even to the books and magazines on the table and music on the piano. Then she arranges a program for each day, changing it sufficiently each day so that the interest of the public is kept.

Her usual engagement lasts for a week, and the hours in which she lives in her glass house extend from 9 o'clock in the morning to 9 at night. At breakfast she wears a smart little gingham house dress, or perhaps enters the dining room in a charming negligee. While her maid, usually furnished by the department store, is using various appliances in doing the routine work of a modern apartment, Miss Sampson is having her manicure and Marcel wave from one of the beauty parlor assistants. Messenger boys arrive with hats, jewelry, gowns, and so on, which she tries on before her mirror. Salesmen come in to demonstrate electric sewing machines, baking sets, vacuum cleaners and the like.

In the afternoon, after a dainty luncheon, served where all the hungry window gazers may be reminded that there is a restaurant and tea room on an upper floor, Miss Sampson changes her gown (behind a handsome screen), receives any callers who may come (these are models from the costume section, wearing the latest dictates of fashion), embroiders a scarf from the art department, plays some late music, or reads a best seller.

Of course, the evening calls for gorgeous costumes, not only on the part of Miss Sampson, but for the models who are her guests. Of the men's department, it may be said that it is well represented by haberdashery and clothing worn by the men who drop in during the day and evening to have a chat with the charming hostess.

When the writer interviewed Miss Sampson in her glass house, he was acutely conscious of the hundreds, nay thousands of noses and eyes that might be counted about the plate glass windows, through which the throngs gazed at Miss Sampson in her daily program. Milady seemed to mind them not a whit, and was perfectly natural and as free from restraint as though she were in her private sitting room.

"Yes," she admitted, "I was very self-conscious when I first began to do this. In spite of the fact that I had been in motion pictures, it did not materially help me in overcoming this, for before the camera you are one of many, and part of a setting. Here I was the whole act; there was nothing to look at except me and the furnishings. But I soon got over my nervousness, and now I do not mind it at all. I really am perfectly happy in my work."

Miss Sampson's charm of person is magnified by her positive dramatic ability, and her outlook on life is wholesome and unafraid. While her field is a new departure, it is proving a very popular one, and she expects to be kept busy for a long time. No doubt by the time her feature has been shown throughout the United States, she will have a new "bee in her bonnet" and use it with as great a degree of success as her present one.

The "Blue Laws" a Myth of Tory Preacher

THE persons who oppose moral measures introduced into legislative bodies do so with the cry, "Blue Law legislation." References are made to these "Blue Laws" so frequently and with such certainty that undoubtedly many persons believe that such a code did actually exist in New England and that the reformers are today simply trying to reinstate a set of restrictive and oppressive measures. Every device of the satirical writer and comic cartoonist has been utilized to create a condition of mob hysteria on the subject.

It is true that the moral laws of Massachusetts and Connecticut were more drastic than those of the other colonies, but this was brought about by the close relationship which existed there between the state and the church. The laws were frequently drafted by men steeped in theology who often cited texts of scripture as authority and naturally the more rigorous the law, the more copiously were the scriptures quoted in justification. In those days, horrible cruelties were common methods of government, but the Puritans of New England were neither cruel nor malicious in their governmental practices. The legal code of Connecticut was mild and generous in the extreme compared with that of England. As late as 1819, there were 223 offenses punishable by death in England and 176 of these were without benefit of clergy. Connecticut as early as 1642 imposed the penalty of death for 12 offenses only.

The following are taken from the Code of 1650 of the general court of Connecticut and have often been incorrectly referred to as the Blue Laws.

> *Idleness.* "It is ordered by this Courte and authority thereof, that no person, howseholder or other shall spend his time idlely or unprofitably under paine of such punishment as the Courte shall thinke meete to inflict and for this end it is ordered that the constable of every place shall use speciall care and dilligence to take knowledge in this kinde, especially of common coasters, unproffitable fowlers and tobacko takers, and present the same unto any magistrate who shall have power to heare and determine the case or transfer it to the next Courte."
>
> *Burglary and Theft.* "For inasmuch as many persons of late have beene and are apt to be injourious to the goods and lives of others, notwithstanding all care and meanes to prevent and punish the same. It is, therefore, ordered by this Courte and authority thereof that if any person shall commit burglary by breaking up any dwelling howse, or shall robb any person in the fields or highway, such a person so offending shall for the first offense bee branded on the forehead with the letter B. If hee shall offend in the same kind the second time hee shall bee branded as before and also be severely whipped, but if hee shall fall into the same offense the third time, hee shall be put to death as being incorrigable and if any person shall commit such burglary or robb in the fields or howses on the Lord's day, besides the former punishments, hee shall for the first offense have one of his eares cutt off and for the second offense in the same kind, hee shall looss his other ear in the same manner and if hee fall into the same offense the third time, hee shall be put to death."
>
> *Gaming.* "Upon complainte of great disorder by the use of the game called shuffle board in howses of common interteinment, whereby such precious time is spent unfruitfully and much waste of wyne and beare occassionally. It is, therefore, ordered and enacted by the authority of this Courte that no person shall henceforth use the said game of shuffle board in any such howse, or in any other howse used as common for such porpose uppon payment of such howse to forfeit for each such offense 20 shillings, and for every person playing in the said game in such howse to forfeit for every offense five shillings."

In 1780 a Tory preacher, Samuel Peters, provoked the resentment of "The Sons of Liberty," a local patriotic society, by his aggressive and loyalistic teachings. He narrowly escaped being tarred and feathered and was finally driven out of the Colonies to England. Burning with rage at the treatment he had received from the Colonists, he published in 1781 a long list of what he declared were authentic laws of the Colony of Connecticut in an attempt to satirize and belittle the character of the patriots battling for American Independence. Among them were such absurd propositions as the following:

"No woman shall kiss her child on the Sabbath or fasting day."

"No one shall run on the Sabbath day; or walk in his garden or elsewhere except reverently to and from meetings."

"No one shall travel, cook victuals, make beds, sweep houses, cut hair or shave on the Sabbath."

"No person shall play any musical instrument except the drum, trumpet or jewsharp."

These fabrications were termed the Blue Laws of Connecticut and are the ones to which reference is made by persons ignorant of their origin.

Again and again the absolute falsehood of the charges of this man Peters has been proved by historians of the highest authority in this country. Likewise, most histories of Connecticut are unanimous in resenting the harm which it is claimed was done by these false laws and deny the fact that the Colonial Acts were intolerant or bigoted in the light of those days. Hollister says:

"It has been said that Connecticut is the 'Blue Law State.' It is difficult for the scholar to understand the precise significance of this cant phrase which bears upon its features such marks of low origin that it is marvelous how it ever could have gained admittance into good society."

It seems astonishing that so much credence could be placed on such an episode as Peters' libel of American customs and that it could be carried so far and adopted by so many.

Where 10,000 Students Govern Themselves

Original Method of Self-government and Honor System in All Examinations Proves Successful at the University of California

By HARRY H. DUNN

THE original, comparatively simple rules of self-government, as laid down by the founders of this Republic, have been in operation for 23 years at one of the largest universities in the world, possibly the largest in actual campus attendance, and have proved a complete, astounding success.

With this self-government, which is participated in by approximately 10,000 boys and girls from 16 to 25 years old, goes hand in hand an hour system applied to all studies, all lectures, all laboratory and field work, all examinations, and even to all athletics. It, too, has been completely satisfactory to students and faculty; its results have been beyond even the hopes of its most enthusiastic proponents, and the violators of the modern Code of Honor have averaged less than one to the thousand of students since the system was put into effect.

These two experiments have been made at the University of California, at Berkeley, on the mainland shore of San Francisco Bay. So widespread has been the impression created by the success of student self-government and the honor system, that the other state universities of the Pacific Slope are either introducing or preparing to introduce them. Outside collegiate circles, the people of California have derived a wonderful lesson from the student self-government system, with its simple rules, uncomplicated machinery of government, and its few officers. The university has demonstrated, with the aid of its students, that men and women can govern themselves perfectly, treat each other with honor and with justice, under a scant dozen laws, and that they can perform all these functions at a time when the governed are at an age at which man is supposed to be least amenable to government of any kind.

The heart of the University of California. Left—California Hall; center, towering Campanile; right center, Boalt Hall of Law; right background, Benjamin Ide Wheeler Hall, the main lecture and assembly building of the university.

Student self-government began in the University of California in November, 1899, when the then president, Dr. Benjamin Ide Wheeler, now president emeritus, chose an informal committee of members of the senior class to assist him in administering student discipline. From that time, when the university had a few hundred students, until today when it has more than 12,000 registered in all the branches, with 10,000 actually on the campus, student self-government has had a steady, practical and forceful growth, until it is now the most powerful factor for development, improvement, loyalty and the general good in any western university.

Historic old North Hall, one of the original buildings of the university, since removed to make way for a modern structure in conformity with the general plans for the campus of the University of California.

In carrying on this self-government, the students are united in a self-perpetuating organization known as the "Associated Students of the University of California." The preamble of the constitution of this, the largest students' organization in the world, well explains the purposes of the association and the objectives sought, when it says:

"The students of the University of California, in order to govern their business interests, and to control all matters of general student concern, form this association.

"Student self-government, first attempted at the University of California in 1899, and conferred upon this association with full powers in 1905, is the basis of the administration of student affairs. The Honor Spirit is likewise a part of the general scheme of the government of this association, dating from its first trial in 1899.

"Self-government and the Honor Spirit rest upon the mutual trust existing between the students on the one hand, and the president of the university and the faculty on the other. The administration of student affairs and interests by this association is both a privilege and an obligation.

"The purpose of this association and of this constitution is to provide a form of governmental machinery which will retain the fundamentals of self-government, and the Honor Spirit, and also provide for their efficient and elastic administration."

DR. DAVID PRESCOTT BARROWS,
President of the University of California, whose recent resignation from that office was the occasion for a demonstration on the part of the students, more than 8,000 of of whom signed a petition, asking him to reconsider his resignation and remain at the head of the University.

The students administer their government through a president, vice-president and secretary; two standing committees, the executive and the accounting, and six councils to supervise directly the interests and affairs of the students through the association. These are the athletics, publications, women's athletics, dramatics, forensics, and welfare councils, all responsible directly to the executive committee of the Associated Students for the proper and efficient management of affairs and the property intrusted to them. Each council has a chairman who must be a senior student. The executive committee of the Associated Students is made up of the chairman of these councils—with the exception of the Welfare Council; the president and vice-president of the association, a senior representative elected at large, a junior man elected at large, a senior woman elected at large, an alumnus of the university appointed by the Alumni Association, and a member of the Academic Senate, appointed by the president of the university. The responsible head of the accounting committee, who is general manager of the association, is an ex-officio member of the executive committee, but has no vote.

The president, vice-president, secretary and treasurer of the Associated Students, and members of some of the councils, are elected by direct vote of the students on the campus, and the elections are among the most interesting features of life at the university. The initiative and referendum are used constantly—the latter on measures adopted by the officers and the executive committee, and the former as a means of getting measures favored by the students before the governing bodies of the association. In other words, there is direct vote, direct representation, and direct action in this student self-government, on all matters pertaining to the business of the students, their control, and their relations to each other and to the faculty. The recall also may be used against any officer.

Students, who fail to live up to the standards of the university, or who commit overt acts, either against the university or against fellow students, are tried by the Welfare Council, which is one of the most important departments of student self-government. Even the rare cheating in examinations, which, under the honor system, has become almost non-existent, comes before this body, which sifts the evidence—no one being placed under oath—and then presents a report and recommendation to the president of the university. To the credit of the hundreds of students who, since 1905, have made up this welfare council, be it said that as yet no president has failed to approve a single one of its findings. The Welfare Council is worth a word more:

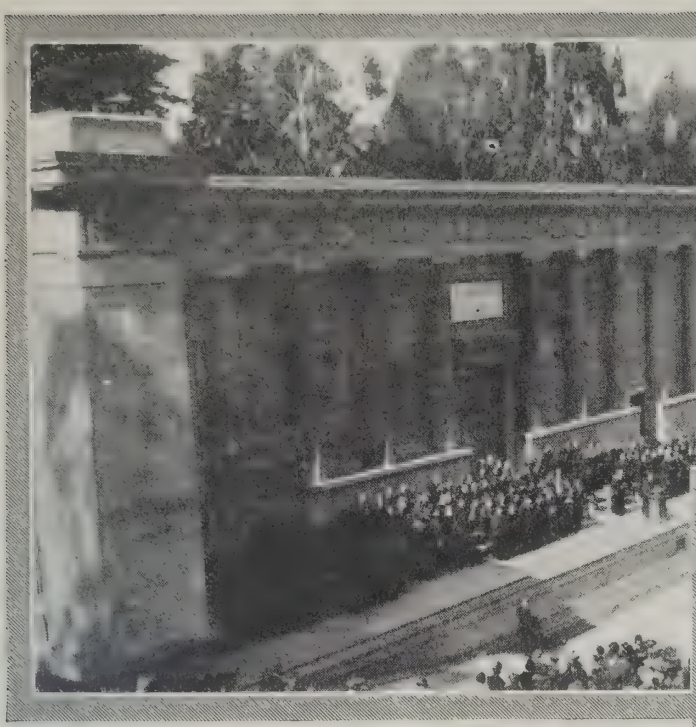
It consists of one representative from each of the colleges and schools of the university, three representatives from each of the four classes, the senior man elected at large to the executive committee, the senior woman elected at large to the executive committee, and the junior representative at large on that committee. The representatives of the colleges must be seniors, and those of the schools must be graduate students. The councilors from the colleges and schools and from the four classes are elected twice yearly, once in April and once in December. "The purpose of the Welfare Council," says the constitution of the Associated Students, "shall be to supervise all matters of importance to the welfare of the students of the university; the enforcement of student control and student government by means of public information and direct action through the Student Affairs Committee."

The senior man elected at large to the executive committee acts as chairman of the Welfare Council. The senior woman elected at large to the executive committee acts as vice-chairman of the Welfare Council, but she has an important work to do in presiding over the sub-committee of the Welfare Council which has jurisdiction over affairs pertaining to the exclusive interests of the women of the Associated Students of the University of California.

As has been mentioned, athletics, publications, of which there are several; women's athletics, forensics, and other activities are handled by managers, who may be chosen from any class. These managers are selected by the councils, each council choosing its manager, and then submitting his or her name to the executive committee for approval. The general manager of the Associated Students must be a graduate of the university, and is chosen by the executive committee, augmented by three alumni, chosen by the governing body of the Alumni Association of the University of California. He is the responsible head of the accounting committee, which has charge of the finances of the association, and is the busiest man on the campus, not even excepting the president of the university.

Publicity is part of the breath of life of these self-governed students at the University of California, and wide and free discussion, follows every new step proposed by students, A. S. U. C. officials or members of the faculty. The better to facilitate discussion, to train young minds in writing and to disseminate to the fullest extent the knowledge of all events on the campus, one daily newspaper and seven other publications are issued by the students under the control of the A. S. U. C., as the Associated Students are commonly known. The *Daily Californian,* an excellent newspaper, started in 1868 under a different name, is issued every week day during the university year. The Blue and Gold is the year book of the university and a class annual. The *Occident* is a literary magazine published monthly by the English Club of the university. The *Pelican* is a comic monthly which has arrived at the dignity and success of paying well for contributions and illustrations. The California *Law Review* is published by the students of the School of Jurisprudence, and has both faculty and student editors. The California *Countryman* is published by the students of agriculture through the Agriculture Club. The California *Pictorial* is a monthly, devoted, as its name implies, to presenting in pictures the history of the month on the campus. The *Commercia* is published by the Commercial Association.

These various publications keep the students alive to all that is going on in all parts of the great 2,500-



A graduating class from one of the colleges of the University of California, at commencement exercises in the Greek Theater, the magnificent stone and concrete open-air structure built into the side of a hill overlooking the entire campus as well as all of San Francisco Bay and surrounding territory.

Sather Gate, the southern entrance to the campus of the University of California, with the Campanille in the background. This memorial gate is the most famous entrance to the university.

acre campus, and it is doubtful if there is a better-informed body of young men and women as to their own affairs than those who are governing themselves at the University of California. A recent call, issued through the *Daily Californian,* for a mass meeting to protest the resignation of Dr. David Prescott Barrows as president of the university, drew such a number of students that more than 8,000 signatures were obtained to a petition to the board of regents and to Dr. Barrows, asking them and him to reconsider the resignation, and protesting to the regents that under no conditions should President Barrows be allowed to leave his post. The mass meeting resolved itself into something like a riot of protest, until President Barrows appeared, and, with tears streaming down his cheeks, thanked virtually the entire student body, gathered before him on the lawn, for its good wishes and good will.

The University of California, which includes the tremendously important and valuable College of Agriculture at Davis, a few miles from Berkeley, and the campus agricultural department of the same college, as housed in Agricultural and Hildegarde halls, also has established a southern branch, at Los Angeles, with three or four thousand students of its own, and rapidly becoming one of the leading institutions of higher education in the Southwest. Student self-government also is installed there, and the Honor System has full sway, just as in the parent university at Berkeley.

Under this Honor System, students are put upon their own sense of self-respect and honor not to cheat, not to harm a fellow-student, to obey the rules and respect the traditions of the university and to comport themselves at all times on the basis of the Golden Rule. One problem of greatest importance in the administration of student affairs is that of insuring honesty in examinations. In many universities the monitor system, comparable to the detailing of an armed guard, is employed.

At the University of California, a professor or instructor giving an examination merely waits a reasonable time for such questions as may arise, and then leaves the students alone in the room in which the examination is being held. At all times these 10,000 or more students are in honor bound neither to give nor accept assistance of any kind from fellow students in any examination.

"There is nothing mysterious about our Honor Spirit," says the *Students' Handbook,* issued by the A. S. U. C. "To understand it is simply to be able to distinguish between right and wrong. Cheating, where it exists, is a malignant cancer in any student body, and threatens to tear down the strength and demolish the organization of that body. It must be torn out by the very roots before we can say that our system of student government has attained its highest success. Each student should bear in mind that he is constantly carrying an unfulfilled obligation to himself, to his fellow students, and to those who have made possible the freedom of student self-government, unless he not only maintains himself above reproach, but also forces all others with whom he comes in contact to adhere strictly to the spirit of honor."

If Pizarro and His Band Were to Return

Concluded from page 9

railway stations by Peruvian women and children. Then she listened uncomfortably to the wisdom of a fellow traveler who discoursed voluminously upon the perils of bacteria on unwashed fruit and the general danger of eating anything at all in rapid ascents into high altitudes; from this he descended through recipes for fleabite and advice about leaving doors ajar in case of anticipated earthquakes, to less uncomfortable recommendations concerning beverages. On the West Coast of South America, he advised fervently, one is wise never to consume water in any other form than as a component of spiritual refreshment or hot coffee.

After much tortuous maneuvering, the train passed the highest of the foothills, leaving behind in a misty-blue vista the curiously tilted Pacific. Before us expanded a wide plateau. Against the eastward edge of it was piled a long rampart of red and gray mountains, the tallest summits of which were silvered with snow. This was our first real glimpse of the mighty Andes. Before us were the western Cordilleras, cutting off the old Inca strongholds from an inhospitable frontier. The plain was a wide waste of sand and pebbles, over which the sunlight flickered an incessant mirage. Pleasant lakes seemed to lap their sand shores in the receding distance. There came a procession, also, of crescent-shaped dunes of a grayish sand silvered in the sunlight, each combed by the wind into the perfect image of every other. They were like atolls in a yellow sea.

He whom we called the Loquacious One, always present on any voyage over land or ocean, awoke from a cat-nap and pointed out *El Misti,* a volcano not quite extinct, though there has been no eruption for centuries; Pichu Pichu, whose slopes are too steep for snow; and the white giants, Ampato and Coropuna.

The scant vegetation of the seaward slopes here disappeared under the fiery sun. Habitations of men were not visible again until the train had reached the edge of the desert and had begun a brave climb into the mountain wall that looked so forbidding from the opposite side. Abandoned villages were more frequent than those showing signs of habitation. Stone walls remained, but the thatch roofs, so said the Loquacious One, had gone to cover new villages, upon land long fallowed for their coming.

Well up in the hills, where steeper ascents brought an uncomfortable crackling to the ears, a district not unlike Southwestern United States came into view. There was a splendid vista over a wide canyon, whose erosions and brilliant colors suggested familiar tinted etchings of the Grand Canyon of the Colorado. At the bottom of the gorge ran a foaming stream, the caressing influence of which was evident in a wide strip of vegetation on either side. Water, green fields, trees, and the comfortable-looking habitations of men were in odd contrast with the orchid-pink precipices overhanging them by a thousand sheer feet. In the wider sections of the valley the fields were laid out in regular, walled rectangles, and clusters of graceful Lombardy poplars gave the whole a classic air. Fields of maize, rice and cotton were distinguishable, and the green fabric of vegetation was ornamented here and there with bursts of wild roses.

We debouched at nightfall into a bellowing, modern railway station and made our way over smooth tiles to a waiting taxi. The metropolitan entry bewildered us, after the day's reversion to an uncompleted planet, but we were soon brought back to a point still far enough from modernity by dark, narrow, jouncing streets—tire factories should conduct their tests here—and by the medieval inn where we found hospice.

There was a rarefied sunshine through billows of chill mist in the morning. Bells from the near cathedral and from more distant churches had begun their oriental tolling long before dawn. One sonorous note was reminiscent particularly of a certain shrine in Nikko. We heard cocks crowing, the insistent bells of taxis, and the warning whistles of traffic policemen, still busy with their night-long serenade. But there was no great vocal stridence from human throats, common to most cities of European tradition. The mood of Arequipa was subdued, as in a sedate village at home. Even the sharp cries of the donkey drivers were modulated and low, insistent yet patient; a peculiar combination of whistle and hiss. Slow-footed Indians shuffled past, barefoot under their burdens, cheeks puffed with the narcotic *coca* leaf that sustains their sinews and lulls their racial conscience. Donkeys laden with fagots, noses close to the offending cobbles, were chaperoned by taciturn Indian drivers, whose eyes, like those of the beasts, were fastened morosely on the course of their feet.

The green-tiled *plaza* was wet with cold dew, and the semi-tropical shrubbery seemed to wince in the chill breeze from Arequipa's encompassing mountains. The early morning light brought out palely the thin pinks and blues that lend a delicate distinction to Peruvian architecture. A uniform height of two stories gives dignity to the business buildings facing three sides of the square, and the cathedral gracefully occupies the fourth. An unbroken balustrade tops the cornice line of the houses, and the square in general has all the elements of Napoleonic design, rather than of the helter-skelter growth that characterizes most cities of the Western Hemisphere. A wooden dog, listening for his master's voice, is the only business advertisement marring this symmetry.

Half-caste children went prattling past the shivering palmettos on their irresolute quest of the schoolroom. Peruvian servant women in black *mantos* began to brave the morning airs. A black-gowned priest, in a wide-brimmed bowler hat, shuffled cathedral-ward, fingering his huge rosary. A poncho-ed Indian swabbed stone paving blocks with a twig broom, and after him a small boy sprinkled the street with water, as in Callao, from Standard Oil tins carried on a burro's back. A Ford taxi and a boy on a bicycle strove to lend an air of modernity to a scene that kept slipping backward in time through such retrograde exhibits as a small donkey, smothered under a mountain of alfalfa, with a female aboriginal atop. Then toy street cars in orange paint awoke to the day's work and gave the winning modern touch.

The sun smiled through the mists upon a group of *cholas* who came laughing into the square. Without these pretty half-caste girls the human aspect of life in the Andes might be drab, indeed. They were a brilliant symphony in flamingo-red skirts and shawls, shiny black shoes with pink rosettes at the instep, and orange-colored straw hats.

One must arise in the frigid blackness before dawn to take the twice-a-week train that runs to Cuzco and Titicaca, lying in the lofty cradle of Inca civilization. The volcanic cone of Misti hung over us, white and cold (we had no desire for its "cyclopean caress"), for many hours after we began our long climb through the fertile valley of the Chile River, ascending by degrees past every climatic "latitude" from temperate to arctic. Eastward the silvery Cordilleras rose more sharply into view as the morning air cleared. Behind, and already far below, lay Arequipa in its green setting, circumscribed by a stony desert.

It was a day of exalting scenery. At 10,000 feet we rounded the flank of a black geological giant and entered upon a region typical of the Peruvian highlands. Villages grew ever more infrequent along the way, and abandoned settlements became numerous. Burro trails, suggestive of the old military highroads of conquistador and Inca, kept company with the railway, some of them well built upon a convenient grade, most of them mere stony arroyos.

Clouds swept alternately above and below us, then settled like milk into huge saucers made by mountain valleys. The railway became a roller-coaster, engine and rear coach frequently moving in opposing directions.

Coarse grass grew in tufts over this region, and there was a purple blossom, proclaimed by the Texans among us as first cousin to the blue-bonnet. A piney shrub about 18 inches high soon supplanted even the hardy grasses, and every station displayed piles of this puny growth, dried, as was the case with another resembling a mammoth toadstool, ready for use as fuel. There was an entire absence of trees at this altitude, and we were to see no more of them until we reached the fertile shores of Titicaca.

From the sharp, thin air of Crucero Alto, which made the lungs a bellows with the slightest exertion, the train carried us rapidly downward for 2,000 feet or more past lakes set in green hills, a pleasant contrast with the aridity of the western slopes. Flamingoes dotted with carmine the reedy margins of glassy, shallow ponds.

A gently falling land, flat and desolate, engulfed us. Southward lay Titicaca, from whose glacier-fed bosom sprang the legendary Incas, Children of the Sun; northward were 200 miles of blood-seared plateau, seemingly too tranquil today even for memories of the time when conquerors swept in and out of Cuzco, the city whose glories are gone with the civilization it sheltered.

BRIEFLY TOLD

A winter sports carnival will be held at Banff, Alberta, from February 24 to March 3. Snowshoe races, curling matches, ski-jumping and ice-skating will be among the events. A dog derby will close the program. Five thousand dollars in prizes will be given winners of events.

Two buffaloes from the Wainwright Park herd in Alberta will be supplied by the Canadian Federal authorities to the Montreal Winter Carnival Committee for the big barbecue which will be held there some time in late February.

Flapperism has invaded Japan. The *Herald of Asia* is protesting against this importation and complains that some of their more light-minded girls are trying to emulate this latest affliction of a much-suffering civilization. Bobbed hair, short skirts and raucous-tongued pertness are conspicuous in the port cities of Japan as well as in Tokyo.

John W. Davis, president of the American Bar Association, said at the association banquet in St. Louis, "Individual liberty is being beaten down, and the right of man to govern himself is being defeated by the threatening encroachment on the Constitution of a 'code of statutes to control the habits and morals of Americans.'" He believes there is too much law and a tendency to ignore mandates of the Constitution. A mysterious being called the state should not be set up to the abandonment of the spirit of individual liberty.

The *Hohenzollern,* formerly the palatial pleasure yacht of the German emperor, is being fitted out as a trade ship by the German Government. The vessel will be sent on a cruise to the British dominions. Stands, displaying German goods, now occupy the former elegantly appointed cabins of the yacht, the beautiful rose pink furnishings having been torn out to make room for the stands.

Fishing through the ice with gold fish as decoys is increasing in popularity among sportsmen. The anglers place a net over the gold fish globe and lower the globe into the water through a hole in the ice. The gold fish act as a lure to the pike who come rushing to the attack. The pike are speared as they appear under the hole in the ice.

More than one-third of the total area of Holland lies below the level of the sea which is kept back by means of dikes.

A seedless and coreless variety of Fameuse apples was distributed at the annual meeting of the Quebec Fruit Growing Association. It is believed the new discovery may revolutionize the Canadian fruit-growing industry.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The American Bible Society believes materialism is giving way to spiritual victories. The Bible is published in 770 languages and dialects and great staffs of experts in America and Europe are busy revising the text. The society in America alone plans to print and distribute for one cent a copy between 5,000,000 and 6,000,000 Bibles this year.

The world's record obelisk has been unearthed at Assouan, Egypt. It is 113 feet long, 14 feet at base, and eight feet at narrow end, and weighs 1,200 tons. Cleopatra's needle is 68½ feet high and weighs 180 tons.

A poll of sixth-grade pupils in St. Louis revealed that of 5,376 children questioned 40 per cent had never seen a sheep, and 17 per cent had never looked upon a pig. Of every hundred children, 12 had never seen a cow. It has been suggested that a cow and a pig be placed in the municipal zoo.

In Berlin the dance mania is so intensive that the government has closed all cabarets where dancing and drinking of cheap wines went on from 5 p. m. until after midnight.

The Ruhr River valley is an oblong basin of coal-beds, about 30 miles wide at the Rhine, narrowing to about 15 miles beyond Dortmund, and 50 miles long. It is the heart of the coal and steel industry of Germany.

A quarter of a billion dollars is the annual fee paid by the unsophisticated to the promoters of fake oil wells.

Alfred Bernhard Nobel, the founder of the Nobel Peace Prize, was a Swedish inventor and philanthropist. He invented dynamite and other deadly explosives serviceable in war, but his heart was all for peace. His will provided for five annual prizes to be awarded to persons who, in different fields of activity, had made the greatest contributions toward the progress of the world and the welfare of humanity.

The London doctors say that the putrid air of the metropolis surcharges the atmosphere with unhealthy gasses within a radius of 25 English miles.

In Norway the shark is caught and utilized. His head is made into glue, his teeth into "ivory" ornaments, his flesh into fertilizer, his liver into "cod-liver" oil and his hide into leather of the finest quality. With millions of sharks in North Pacific waters there is no reason why marketable and needful products could not be made from them by the cities of that coast.

Italy leads the world in the manufacture of violin strings.

Professor Herman Lundborg, of Sweden, says, "There is grave doubt whether a people really gains anything when millions of money pour into the country. Luxuries are demanded, lassitude sets in, and the interest in work and production falls off. Women avoid maternity, and these processes, beginning in the middle and upper classes, gradually work downward and in time destroy the race."

The radio broadcasting station of the General Electric Company at Schenectady, New York, WGY, has been heard in every state in the Union.

A million or more square miles of what is, at present, unproductive land in the arctic and sub-arctic regions of Canada are to be used as a permanent grazing area for musk ox, if plans of the Royal Commission of Canada mature. The musk ox grazes on lichen, moss and willow shoots and unlike the caribou is not a migratory animal, but grazes in much the same way as do domestic cattle, moving only as food conditions render this necessary. The flesh of this animal is nutritious and palatable and similar to beef.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

CHRONICLER OF THE NEGLECTED TRUTH

"Too Many Laws," Enacted by Congress, Rapidly Threaten a "Government of Men"

No Federal Legislation Ever Repealed; Last Code Adopted 50 Years Ago; New One, Three Times as Bulky, Questioned by Senate as to Completeness

By AARON HARDY ULM

"THIS is a government of law and not of men," declared Chief Justice Marshall more than 75 years ago. What the famous jurist might add if he were writing that opinion today is that excess of law leads toward a government of men.

It isn't the law that guides government but what men in power for a time say is the law. This isn't necessarily because officials are inclined to make their own law. It is because we have *so much law* that it is difficult and often impossible for an official to know actually what the law is with regard to many things coming within his purview.

This is not an extreme statement. Congress for two years has hesitated to declare in clear terms what constitute the Federal laws. It hesitates because it isn't sure that Congress' own enactments can now be put forth accurately in codified form.

Fifty years have passed since the last Federal code was adopted. It is now all but worthless as a compilation of Federal laws.

Several years ago Congress directed a committee to prepare a new code. Much time and study were given to the work, which consisted of bringing together in orderly form all outstanding laws as enacted by Congress. This meant eliminating all parts of the revised statutes of 1874 as republished in 1878 that have been repealed and the adding to the remainder all laws since enacted.

The report of the committee, as made in May, 1921, proposes a new Federal Code. It contains no brand-new law. No law as enacted by Congress was modified in accordance with court opinions. The volume includes no "annotations."

Fifteen Pounds of New Code

THE paper-bound volume constituting the report weighs about 15 pounds. It contains more than 5,000,000 words. It is approximately three times as large as the revised statutes of 1874. That is to say, we now have at least three times as much Federal statutory law—when measured by words—as was in force 50 years ago. And it is being added to annually about 12 times as fast as at the time of the enactment of the old code.

When the new code came up for consideration by the House of Representatives it was adopted without much discussion; it was "swallowed whole." The House could do nothing else; it would be busy with the job yet had its members tried to determine whether the codification was fully accurate.

It is doubtful if any two lawyers who thoroughly examined the volume could agree as to whether it contains all the Federal laws. For those laws are so voluminous and so complex that, as indicated, it is all but impossible to determine what all really are. Without a code to guide him, the official must often determine the law for himself.

"Every man has a right to know what the laws are, and a half-hundred Federal judges and attorneys have told us that no man can know certainly what the laws are now after 47 years of legislation unchecked," declared Congressman Little, of Kansas, a short time ago. The Congressman is chairman of the committee which prepared the proposed new code.

The Senate apparently refuses to accept the code as adopted nearly two years ago by the House. This isn't because the Senate is certain that the revision was not properly made. Rather, senatorial hesitancy is the result of the Senate's not knowing and in not having any sure way of finding out what the Federal laws really are.

For several executive branches of the government, notably the legal advisers of the Navy Department, disagree with the House committee on what the laws are with reference to various subjects, and it is all but impossible to find who is right.

Patchwork to Blame

THIS disagreement and the uncertainty which gives it body are due largely to the patchwork method employed generally in making laws. Few acts, for example, are ever specifically repealed. Nearly all new acts contain the proviso that all prior legislation in conflict with them is repealed. This method of repealing "by implication" causes a great deal of confusion, for generally only uncertain parts of acts are thus repealed or modified.

The method illustrates the tendency to enact more laws to correct evils resulting from laws held to be bad or which outlive their need. Rarely is the simple process of repeal employed. This has led to overburdening of courts with disputes as to what really is the law. To an extent the condition supports, "in republics laws are made by the rich and obeyed by the poor." For it does give many decided advantages to those able to spend unlimited sums on litigation. This is proved constantly in operation of the patent laws, which have become so complicated that only persons who are able to pursue long court fights can obtain the protection those laws are presumed to provide for all. Patent law is so confusing that many now advocate repeal of all the patent laws.

The volume and complexity of Federal laws have so increased the amount and cost of certain kinds of "expert advice and assistance" as to verge on the scandalous.

Several government establishments have become virtual "training schools" for persons who expect to become private experts for outsiders in dealing with the government.

This is notably true of several branches of the Treasury, particularly of the Internal Revenue Bureau, and most particularly of the income tax division of that establishment.

A person who obtains a modest position, if clever in handling the government's business, can depend on being offered, by a private agency, several times the salary the government pays. The agency, of course, has important business transactions with the income tax branch of the government. The employe has had excellent opportunity to learn not only how the government construes its laws but also the manifold peculiarities of administration of the laws. The "turnover" of employes in some bureaus is astounding. Even the Patent Office is affected. Capable examiners constantly are being drawn away by large interests that have big patent business with the government.

An old law, together with numerous departmental regulations, denying a government employe the right to "practice," within a fixed period of time following resignation, before the branch of the government where "training" was procured, is intended to check this evil. But these restraining influences are seldom a handicap.

The number of "attorneys" practicing before the departments has doubled and trebled during recent years and the rewards generally are unusually good. The persons so engaged include not only former departmental employes but former members of Congress and former members of the Cabinet and others who once were high officials in the government.

Their assistance has become as necessary to persons who wish to deal honestly with the government as with the contrary type. For dealing honestly with the government frequently is a very difficult procedure, made so by the great volume and complexity of laws now outstanding.

In the small scandal always being retailed in the gossipy circles of Washington one hears frequently of improper methods being employed to "put over" things that are entirely legal and proper. If the system makes that possible what leeway must it provide for "putting over" that which is improper.

Tending Away From Law

WHEN laws become so bulky and complex that even the lawmakers are not sure that they can tell what the laws are, discretion in administration necessarily must follow. The laws thus become what the enforcers say they are, and the government tends toward becoming "one of men."

So, under one administrator what might be perfectly good law, under another set might well be perfectly bad law. An impartial study probably would bring out that many laws passed originally to curb malefactors are today the prop and dependence *of the very interests they were aimed to control.* This, as noted in another article, seems to be true of most laws enacted originally to "regulate" the railroads. It doubtless is true of much financial legislation.

Only a small portion of Federal legislation has to do with "crime." The penal code sections of the proposed revised statutes in Congress fill only a few hundred of the nearly 12,000 big pages covered by the House committee's report.

Nearly all Federal laws have to do with various kinds of "regulation." Even the tax-raising statutes are filled with "regulating" enactments. Some are very curious, for often, by indirection, rate as criminal practices which in themselves are not improper and which involve no elements of moral turpitude.

Many years ago, for example, Congress was prevailed on to employ its taxing power to forbid virtually the selling of "mixed flour." Under the law, a mixture, say of wheat flour and corn meal, if transported in interstate commerce, must be labeled in box-car type and also must bear an internal revenue tax. The requirement that foodstuffs sold in packages be correctly labeled prevents deception and now applies to virtually all foods and drugs. The patent purpose of the prohibitory regulation governing "mixed flour" is to prevent its sale and use in any form. This isn't because "mixed flour" necessarily is bad; in fact, the students of food values say that only by mixing the products of different grains can the best cereal food be evolved. The "mixed flour" regulation is to protect certain interests. When we entered the war it was found that it interfered with the food situation and was suspended, but for the duration of the war only.

The Federal statutes contain many laws which do not forbid acts that in themselves are wrong but rate as criminal acts that in themselves have high merit.

This is true perhaps of the statutes which place high taxes on oleomargarine and other butter substitutes. While no butter substitute has the full dietetic value of good butter many are much better than no butter. About the only essential difference between them as food and real butter is the high content of vitamines in butter. But vitamines were unknown when the oleomargarine tax was established. That tax had one purpose—to hobble all butter substitutes, good as well as bad, as competitors of butter. Thus the poor who are unable to buy butter but can afford oleomargarine have to pay several million dollars a year taxes on the butter-like foods they consume—taxes that are imposed directly on extreme poverty. The tax so increases the cost of butter substitutes that many persons can't afford them and therefore are denied the right to eat any butter-like foods.

For the last year Congress has been on the verge of enacting a statute that would outlaw so-called "filled milk." It is embodied in what is known as the Voight bill.

"Filled milk" is real milk from which the cream has been taken and good vegetable oil, in the main from cocoanuts, added. It enables many poor persons to procure a milk product that when properly made is as high, or higher, in caloric food value as the best of pure milk. "Filled milk," like oleomargarine, is probably lacking in vitamines and is not so wholesome for children as unskimmed milk. But it is better than no milk, which many thousands do not get.

As to Postal Savings

THE reason the Voight bill passed the House and if voted on in the Senate will be enacted into law is that "filled milk," which as far as it goes is a wholesome food, and makes possible the utilization of what otherwise would be a semi-waste product, competes with real milk. Thus it is to be rated as something that is criminally unfit!

This sort of legislation rarely has backing *except from those who have more or less selfish interest in it. It rarely ever is popularly opposed, for the reason that those who suffer most from it, generally persons who are so poor that they can't avoid its effect, are inarticulate.*

But finely wrought devices for preventing laws harming interests that are articulate may be discovered in many Federal statutes.

Several years ago there was great demand for a postal savings bank system, such as was operated in many European countries. Finally it was established. But extreme caution was taken to see that it did not interfere with the banks. **The government now accepts deposits for which it pays two per cent interest. It turns the money over to the banks who pay the government two and one-half per cent interest. In recent years the government has had to borrow a great deal of money from the banks. For that money it has paid from four to five per cent interest, even when it was the money that the government had deposited, in the form of postal savings, in the banks.**

This anomaly is now partly eradicated, at least in theory, by the offerings to depositors of postal savings bonds, by means of which the owners of the postal savings get a larger interest and the government can use their money without depositing it in and then borrowing it from the banks.

Thus the "roundabout way" is ever the one by which such problems are approached.

Once Passed, Goes on Forever

FOR when put into the statute books the chance is that a law will go on forever and will be changed only by substitution or by addition. To get laws repealed involves a task which few public men have the hardihood to undertake.

Even the old question of free trade or protection or a "tariff for revenue only" no longer figures in the periodic revamping of tariff schedules. The contests over the tariff are, almost wholly, between those interests that will benefit specially from tariff protection, or the absence thereof, in specific instances.

One of these days a super-Borah type of statesman is going to come along and concentrate on two things: Opposition to all new laws and repeal of old ones. Most of the public men who now see the need for such an undertaking are afraid of the charge of negation, a word of contumely in the lexicon of modern-day politics. But it always hasn't been a word of political disrepute.

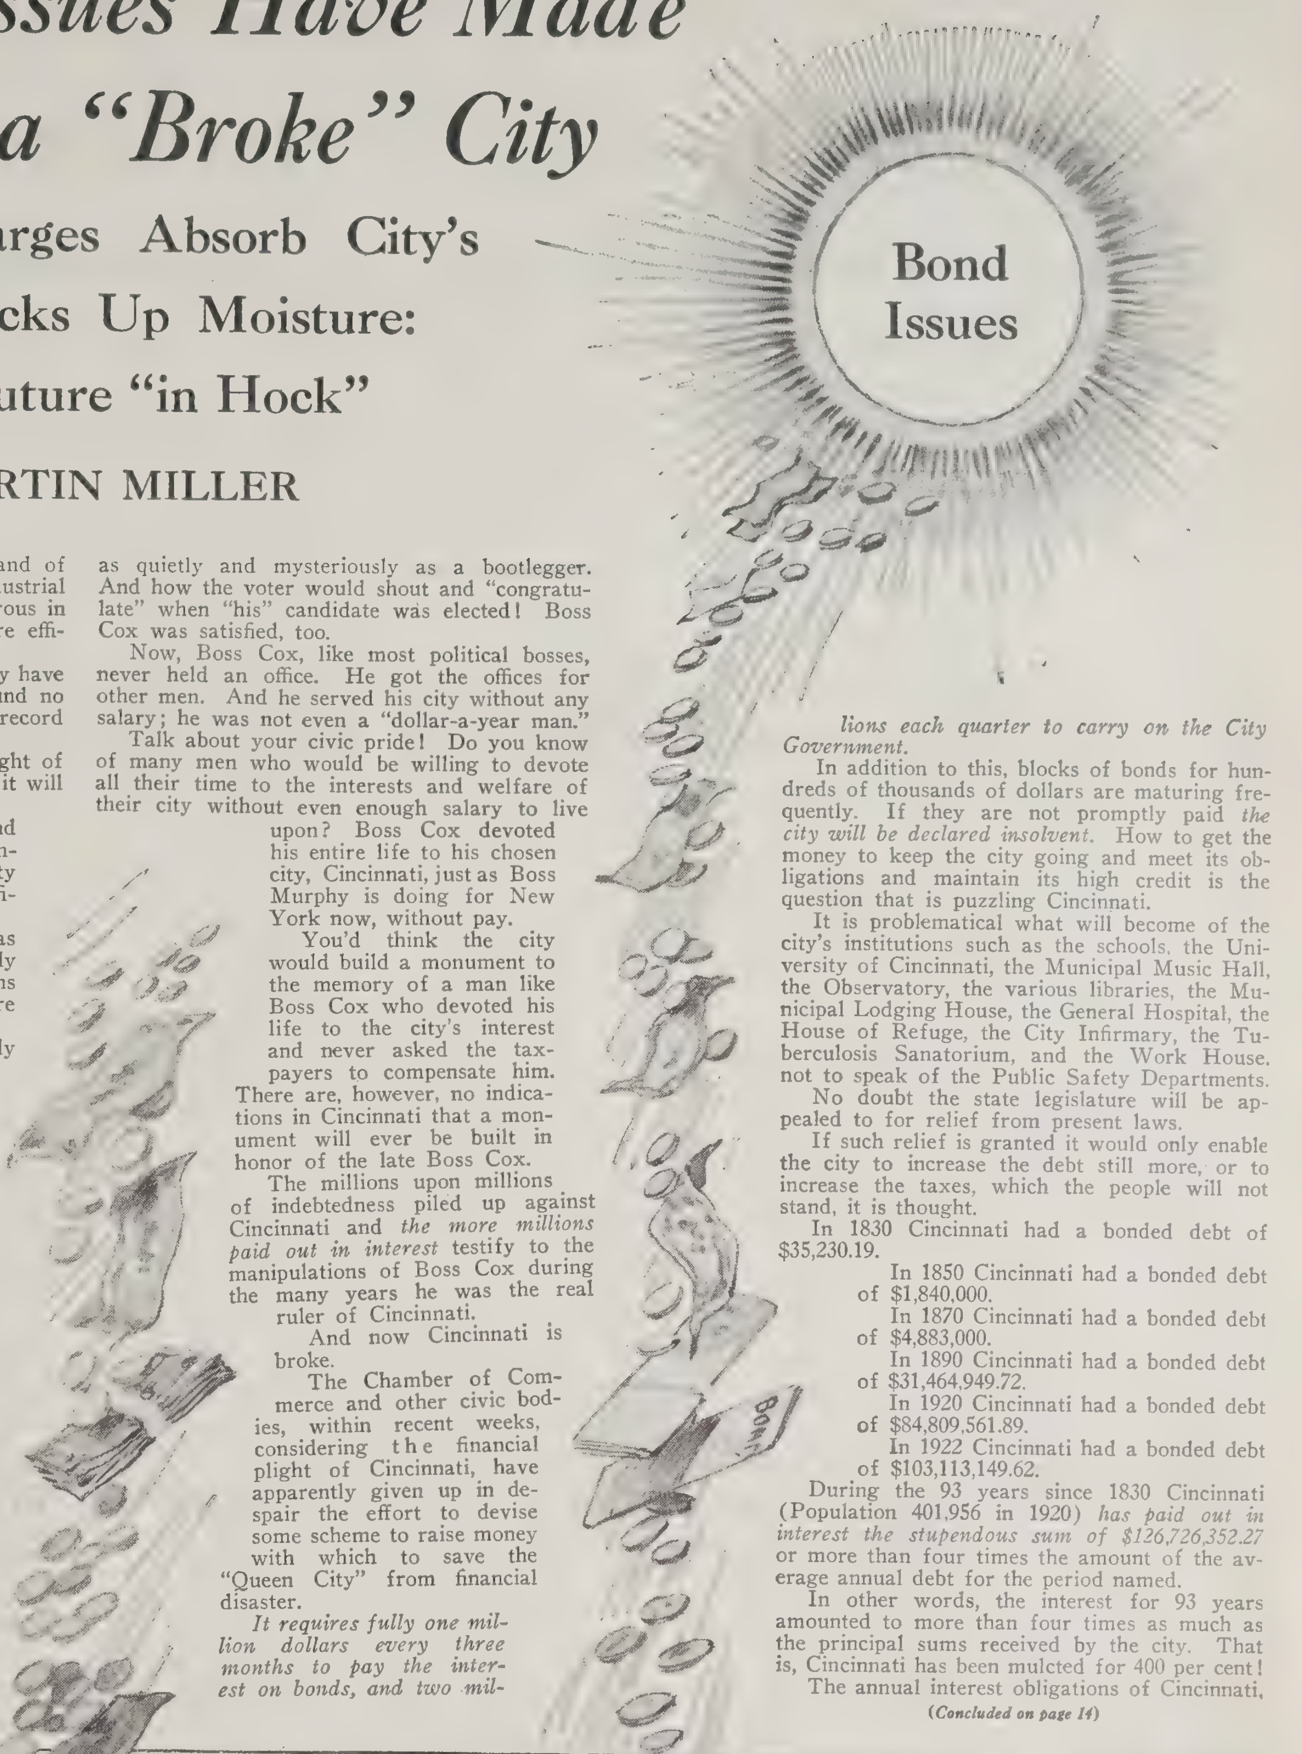
"When I first came to Congress as a page in one of the houses," an old attaché of the national legislative body said, "the members who stood out, the ones who had the confidence and esteem of the country in greatest degree, were noted for what they opposed much more than for what they supported. Now it is different. That's why we have so much law that no one, not even those who make it, can tell exactly what the law is."

Another article, completing Mr. Ulm's work along this line, will appear in an early issue of THE DEARBORN INDEPENDENT.

How Bond Issues Have Made Cincinnati a "Broke" City

Annual Interest Charges Absorb City's Wealth as Sun Sucks Up Moisture: Politicians Put Future "in Hock"

By JAMES MARTIN MILLER



CINCINNATI, Ohio, is a city of culture and of great wealth. Its individuals and its industrial establishments are among the most prosperous in the nation. In private business Cincinnatians are efficient and enterprising men.

But these high qualities of probity and efficiency have in the private business of the "Queen City" found no place in the public business of Cincinnati as the record proves conclusively.

"But you must not tell about the financial plight of Cincinnati, as a municipality, in such a way that it will injure our credit," a "City Hall" official pleaded.

This means that the politicians operating behind the scenes, from force of habit, are not much concerned about the impending insolvency of their city so long as they can keep the facts about their financial manipulations from the people.

And the "City Hall" crowd in Cincinnati, as well as other American cities, have been amazingly successful in hiding their methods. The politicians know, from long experience, that the people are easy.

For many years Cincinnati was ruled absolutely by one of the most "eminent" bosses in this country. Boss Cox was typical of the bosses who ruled, and still rule, New York, Chicago and other cities in this country. New York had Boss Tweed and Boss Crocker, and it now has Boss Murphy, and more than $1,000,000,000 of debt.

All these, like Boss Cox of Cincinnati, became men of great wealth.

Boss Cox began as a "poor boy." Mayors and other city officials came and went with each election, but Boss Cox stayed on "forever." Any man who wished to be elected to office in Cincinnati had to dance attendance to Boss Cox and "stand in" with him else he could never hold a city office.

Boss Cox decided who was to have the offices and get the municipal contracts, as well as which banks and brokers manipulated the city bonds and had the use of the city's cash in deposits. He finally started his own bank for that purpose which finally got him into serious trouble.

The people were made to believe that *they* elected their officials. True, they were permitted to go through with the formality of an election, but they were playing with "loaded dice." They simply voted for the men who were "hand picked" by Boss Cox, who worked as quietly and mysteriously as a bootlegger. And how the voter would shout and "congratulate" when "his" candidate was elected! Boss Cox was satisfied, too.

Now, Boss Cox, like most political bosses, never held an office. He got the offices for other men. And he served his city without any salary; he was not even a "dollar-a-year man."

Talk about your civic pride! Do you know of many men who would be willing to devote all their time to the interests and welfare of their city without even enough salary to live upon? Boss Cox devoted his entire life to his chosen city, Cincinnati, just as Boss Murphy is doing for New York now, without pay.

You'd think the city would build a monument to the memory of a man like Boss Cox who devoted his life to the city's interest and never asked the taxpayers to compensate him. There are, however, no indications in Cincinnati that a monument will ever be built in honor of the late Boss Cox.

The millions upon millions of indebtedness piled up against Cincinnati and *the more millions paid out in interest* testify to the manipulations of Boss Cox during the many years he was the real ruler of Cincinnati.

And now Cincinnati is broke.

The Chamber of Commerce and other civic bodies, within recent weeks, considering the financial plight of Cincinnati, have apparently given up in despair the effort to devise some scheme to raise money with which to save the "Queen City" from financial disaster.

It requires fully one million dollars every three months to pay the interest on bonds, and two millions each quarter to carry on the City Government.

In addition to this, blocks of bonds for hundreds of thousands of dollars are maturing frequently. If they are not promptly paid *the city will be declared insolvent.* How to get the money to keep the city going and meet its obligations and maintain its high credit is the question that is puzzling Cincinnati.

It is problematical what will become of the city's institutions such as the schools, the University of Cincinnati, the Municipal Music Hall, the Observatory, the various libraries, the Municipal Lodging House, the General Hospital, the House of Refuge, the City Infirmary, the Tuberculosis Sanatorium, and the Work House, not to speak of the Public Safety Departments.

No doubt the state legislature will be appealed to for relief from present laws.

If such relief is granted it would only enable the city to increase the debt still more, or to increase the taxes, which the people will not stand, it is thought.

In 1830 Cincinnati had a bonded debt of $35,230.19.

In 1850 Cincinnati had a bonded debt of $1,840,000.

In 1870 Cincinnati had a bonded debt of $4,883,000.

In 1890 Cincinnati had a bonded debt of $31,464,949.72.

In 1920 Cincinnati had a bonded debt of $84,809,561.89.

In 1922 Cincinnati had a bonded debt of $103,113,149.62.

During the 93 years since 1830 Cincinnati (Population 401,956 in 1920) *has paid out in interest the stupendous sum of $126,726,352.27* or more than four times the amount of the average annual debt for the period named.

In other words, the interest for 93 years amounted to more than four times as much as the principal sums received by the city. That is, Cincinnati has been mulcted for 400 per cent!

The annual interest obligations of Cincinnati,

(*Concluded on page 14*)

Senators:

SELDOM in this country have facts been clouded so malevolently and so successfully as have the facts in what is known as the Cronkhite-Rosenbluth case.

We find first a carefully mapped program of propaganda that takes in the newspapers of the entire country, and includes the schools of New York City.

We find an indicted man carefully groomed to appear in the role of a Dreyfus—a martyr to a military clique presumably. Were it not for the tragedy of poor Cronkhite, such presumptuous ranting would be drowned in ridicule.

We find the elder Cronkhite, a fine American soldier, made the victim of the basest calumny.

And in addition to the foregoing, *and many other facts which* The Dearborn Independent *is prepared to introduce from time to time,* we find that the American Jewish Committee, an avowed racial senate, has raised its head, *to see that the judicial processes ordained by the American people are not followed.*

The Dearborn Independent has sought simply to bring out the facts in this remarkable case. Without the facts, a most hideous wound to justice had been dealt. It is not the "Rosenbluth Case" only, nor even the "Cronkhite Case," but the case of the American people and the American courts. It is not only a case of justice to a murdered soldier but also of justice to a living soldier whose interest in the honor of his son and the honor of the army has been sufficient to move the time-serving War Secretary against him. Whether General Pershing too has succumbed is a matter on which no opinion is voiced at present.

Today, however, there is a situation that must be met squarely. General Cronkhite has placed his facts before two members of the United States Senate. These two Senators have been besought to demand a congressional inquiry into the unprecedented conditions that have arisen. The inquiry is justified because it has been asked for and because Secretary Weeks has made statements to which in fairness there must be made an official reply. We must warn the Senators, however, that unless they are courageously prepared to go through *to the finish* with the inquiry so thoroughly merited *they must not begin it.* But if they *begin it* they are serving American institutions and above all they are serving that National Confidence which must always rest on the integrity of those institutions.

"Penny" or "Cent"

THE *Pathfinder,* usually a purist in the use of language, deems the subject worth a column leader editorial when criticised for using the word "penny" to indicate the "cent," the smallest coin in the American money system. It defends its position by calling attention to a secondary dictionary definition of "penny," which is general and means any small coin. The fact that in the criticised use of the word the specific "cent" was referred to does not occur to the writer to destroy any connection to his defense.

The proverb by Franklin that "a penny saved is a penny earned" is also used to bolster up a weak cause, since it was uttered when there was no such coin as the American "cent" in existence, the money of the country then being in denominations of the English system.

The *Pathfinder* then speaks of the tenpenny nail, so-called from its approximate weight and not because of its relation to value. In fact, all of its examples are of similar character, and their merit is confined to the convincing of ignorance that the indiscriminate use of "cent" and "penny" in allusion to the American coin is proper. When the American decimal system was adopted it was the more popular, since the Spanish milled dollar was really the only coin money in general circulation. Currency was in terms of shillings and pence generally, just before the Revolution, but was discarded when this nation set up for itself, and the subsidiary coinage was in terms of the dollar established as the unit. Thus we have the half and quarter dollar, and the dime, a tenth of the dollar, the half dime, and the hundredth part of the dollar, or "cent," strictly a derivative of the Latin term for the hundredth.

The word "penny" is a specific term for the English coin, and represents a value of about two American "cents." It is not the smallest coin in that system, for the "halfpenny" is its division. Higher coins are the "threepenny," the sixpence, the shilling, each of which represents a double value of general terms used in this country for more than a half-century after it was established and the coins themselves were discontinued as American money.

The writer of the defense of the penny alludes to the fact that eagle and double eagle are not generally used in speaking of money. These are the legal titles for gold coins representing 10 and 20 dollars respectively. These coins are not in general circulation, but are represented by paper money bearing the inscription of their value in terms of dollars. In fact, the coins themselves are stamped in dollars.

The dollar is the unit of United States currency, the term is used on all denominations of currency down to the dime, and the cent used for the smaller denominations.

The careful speaker will never allude to the cent as a penny, and to defend such use one writes himself down an ass in the only proper understanding of that term.

How Lovely!

IT IS announced by the bituminous operators and miners that they will not have a strike this year. They have decided to skip this year. They have reached this decision together—in exactly the same way as they formerly reached decisions to have a strike. The exposure this year of the partnership which exists between the miners' unions and the speculative capitalists, has apparently put a spirit of fear upon the leaders. The miners themselves perhaps have discovered for the first time how they have been duped. The combination of speculative capitalists and traitorous labor leaders has cheated the miner out of wages and labor, and the public out of coal and fair prices. But it is real lovely of them to announce that this year they will not oppress the miners nor the public.

Drab Fact at the King's Tomb

DOUBTLESS more than one newspaper reader has had it flash across his mind, when reading of the excavation of Egyptian tombs, that the whole matter was being carried on with more of the accompaniments of a modern circus than of a scientific investigation. The promptness with which prices were affixed to the materials discovered; the protests of the uncommercial natives against the violation of the last sanctuary of kings; above all the unparalleled press-agenting done far and wide—these things were sufficient to cause the observant to be ready for the hook when it came, if there should be a hook.

We shall see what we shall see, but meantime the facts are these. It is Rothschild money that is digging up the tombs, and it is a private commercial enterprise. Lord Carnarvon married a daughter of the Rothschilds, hired an explorer named Carter, and started out where the digging seems to be free-for-all.

Arthur Weigall, formerly connected with the antiquities department of the Egyptian Government, has given us an illuminating picture of the crass materialism that surrounds the work to date. He says that the delay which continues up to the time of this writing is occasioned by the determination of the government that Carnarvon shall not be permitted to open Tutankhamen's inner tomb in secret. It is intimated that there has been altogether too much secrecy with regard to the actual operations, though all kinds of publicity for the alleged results of the operations. Weigall writes: "The talk is all of news rights, film rights, photo rights, book rights, and how to keep them profitably exclusive, until the serious archeologist, looking with anxiety into the future, is nauseated and his principles of scientific work outraged."

Race Knowledge or Race Prejudice

THERE has come upon humanity a new springtime of race consciousness. Races are becoming aware of themselves and of each other. What the meaning of this may be will be stated by each one according to his knowledge. To one group it is horrible to think of this new race consciousness; to another it is very hopeful. The first group glories in concealment and in the pretty fiction that there are no races, no racial differences, no racial destinies. The second group acknowledges the fact and believes that it "means intensely and means good." It is these latter who are to be trusted. The societies formed to suppress racial awareness and the pitiable publicity organized to denounce racial awareness, are to be greatly distrusted. The natural way is the better way to consider it all.

In the welter of procured publicity now deluging the country, two facts are carefully suppressed.

First, no objection is offered to any form of race consciousness save that of the northern white race. If the Negro shows a new realization that he is a member of a race of long antecedents and of greater possibilities, he is encouraged in that. Strangely enough, he is most strongly encouraged by the very groups who denounce race consciousness in the northern white race. If the Jew shows a strong strain of race consciousness, he is approved in that. No objection is raised anywhere because a particular people comes to a consciousness of who and what they are. It is regarded as perfectly natural. It is certainly lawful. It may even be capable of producing a new era of racial progress. That is to say, when any other racial group is being considered, this awakening which we call "race consciousness" is never confused with "race prejudice." We are willing to concede that the Negro, for example, may come to a new vision of the dignity and history of his own race without thereby conceiving a special prejudice against another race. But that fact, though insistently worked upon everywhere, is never brought to the fore in the bought-and-paid-for propaganda about "race prejudice."

Second, nowhere is race awareness called "race prejudice" and "race hatred" except when the northern white race begins to observe the various racial groups within and around it. The great crime seems to be that the northern white should ever awaken. If he looks to see, he is assaulted with cries of "prejudice," "hatred." If one fine day he happens to shake himself and observe that the Jews have taken over pretty much everything and are administering it more for their own racial benefit than for the benefit of society—a fair observation and based on facts—then he is bludgeoned with the cry of "anti-Semitism." He is charged not only with "race prejudice," but "race hatred." He must go back to sleep again; he must observe nothing; he must not even say "Jew"—that must be left for the interior of B'nai B'rith lodges. He blinks, wondering what his crime is! Is it wrong to see with one's eyes? Is it wrong to speak what one sees? Must the northern white, of all mankind, be muzzled?

Now, if the pen puppets and the editors will take a little time off from their grossly unintelligent propaganda, and simply acknowledge these two omissions, and observe the truth that race awareness is not "race prejudice," it will do much to clear the atmosphere. It is not suppression that we need, but intelligent frankness. We encourage it among every race but our own.

Why? The northern white is probably the least race-conscious of all the world. He has no inferiority complex that makes him think of himself continually, nor has he a superiority complex. He has been the friend and protector of all races. He is the only race that ever voluntarily made freemen of other races. In common with the others, he is feeling the breeze of a new consciousness blowing over the races of men. There is a great swarming of the races. But the race consciousness of the northern white is different from the others in this respect, he is not so conscious of himself as he is of the others—he is seeing them—and this is not to be suspected, misjudged or condemned—for he it is who must make the earth a home for all the races that they shall have liberty and opportunity to come to their full stature, developing themselves and serving the world.

Races are here. What editor—rather printer—of the current propaganda would conceal the fact? Why not rather interpret it?

But that would be race consciousness! And to be "aware" in this field, is to be "prejudiced"! It is time our American press came to its senses on this subject.

Mr. Ford's Page

EVENTUALLY the people rule. It is always safe to return to that point as a basis. They are ruling now, inasmuch as they permit the kind of rule which exists now. When this kind of rule ceases to be to their taste, they will substitute another. The people are not politicians, they are not even political economists; they are pragmatists—that is, they believe in the thing that works well, because they believe that if a thing works well it cannot be very far wrong.

The whole situation which faces the rulers of the world today—the parties, the politicians, the princes—may be stated in four words: *it does not work.* The complaint of the people is never against form or method, but always against failure to function. We in America sometimes try to persuade ourselves that it was our fathers' dislike of the monarchy that led them to seek entire political independence of the mother country, but the question of the monarchy hardly entered at all, save through the minds of those Americans who were tainted with the so-called "French" philosophy of the so-called French Revolution. It was the question of a system that did not function, and on that question was our political independence determined. The effort our fathers made to free themselves from the monarchy was nothing as compared with the efforts they made to save the monarchy from its crowning acts of stupidity.

THERE is no failure except failure to serve one's purpose. The secret of the protests that shake the world today is that something has failed to serve its purpose. Whatever serves is thereby preserved, what fails to serve is cast aside. Governments are now more served than serving. They are administered so that they have become a burden to people instead of a help. Count up the laws which the government passes for its own benefit! The government is now the most powerful special interest in the country, and its interests elbow the interests of the people aside. When that occurs, when that which should help becomes instead a burden that is resented, the function of government has been terribly defeated. Such a situation always presages imminent challenge and change. The consent of the governed is always based on the service of the governed.

That is to say, the people do not at stated intervals beget a desire to change things for the sake of change, they do not advance on theories. The theories they cherish represent their assertion of a principle that will function, as against a system that has failed to function.

Take the political situation in the United States today. You can read or hear on every side that the people are tired of parties. And likewise you hear and read of other parties which shall express the people's weariness of parties. But are the people really thinking of the party system at all, whether we ought to have two, or whether we ought to abolish them all, or whether we ought to have more than we have ever had before? If you make this inquiry you will find that the people have no interest in parties as parties, no interest whatever. They had been perfectly willing to let parties function forever, and to let partisans play their little games to the end of time, if only parties would function serviceably for the people. That is all that the people have ever asked, and they have never been moved to assert their irresistible power except when service has been forgotten.

Nothing that serves the people ever passes away. Indeed it is amazing to observe, how, in the most unlikely places, the useful old things persist. The candle, for example, is still an article of commerce, and not only that but to a far greater degree than ever before. The world found the candle useful and has not allowed it to pass away. "All the good the past hath had, remains to make our own time glad." The earth is beloved of the people because the earth is faithful and serves them.

Now, few things are more difficult than to give simple things the impressiveness which their importance merits. Here is a plain truth, here is an important truth, here is a truth so simple as to be almost unutterable: the key to the world's trouble is *disservice.*

In some matters it is now too late to see this. Time was when things might have been saved, might have gone on as they were, by a simple return to the principle of making the service of the people the main objective of endeavor. Systems and places now doomed might have been saved. They cannot be saved now, for when a principle is adopted only for reasons of self-salvation, it is already too late.

This is one of the facts whose neglect has prevented us seeing the European situation in a true light. Many things in Europe, which are now frantically calling to be saved, will not be saved; it is too late. They have got to crash. There was a time when, had they repented their past selfishness and taken the path of service, they might have been saved; but they cannot be saved now. If Americans learned to distinguish what is passing and what remains, the confusion would not be so great. The confusion is mostly caused by these doomed systems crying out to us that unless *they* are saved *the people* of Europe are lost. Not at all: the truth is this—the people of Europe are being saved by the destruction of unserviceable systems. The doom of the people of Europe would be to have those systems saved. There comes a time when a system has betrayed the people so long that it could never serve them, however often it may be reprieved. The possibility of mercy is entirely past with many positions of power which have not been administered for the common good.

The terms we use in matters like this need the illumination of events to give them meaning. Words like "serving the people" and "the common good" have been made meaningless by the deceit of those who most used them. It may be said that they are almost the mottoes, the watchwords of the very systems which are doomed because they did not serve the people and because they did not seek the common good.

And yet it is startlingly true that you will search in vain, especially in the field of government, to see anything voluntarily undertaken out of a desire to add to the privileges or prosperity of the people. You will spend your time in government circles in vain looking for a sign of the motive of the people's good. Examine the speeches made, examine the new laws proposed, where is there one that springs out of a vision of how the people's freedom may be increased and of how the people's prosperity may be enlarged? Where is there one?

The nearest a government ever comes, apparently, to this thought is when the government is still a "party" seeking office. And then it makes certain proposals for the people (which it seldom fulfills) but the motive behind it is the office, not the people's good.

The service of the people is forgotten. The people are only *one of the interests* clamoring for recognition from the government. Think of that. An appalling proportion of the laws passed are passed in favor of the government's special friends. (The people are not accounted one of these special friends.) The rest of the laws are passed in favor of the government. The government *itself* has now become so great and individual and selfish an interest in and of *itself*, that by the time it takes care of *itself* and of its friends, anything further would be too great a burden for the country to bear.

We have lived to see in this country our first doubt that the government existed to serve the people. We have lived to see men's first signs of discontent and distrust of a system that served itself first, and whose service is becoming so heavy as to shoulder out all possibility of other service. We have lived to see this system of government devour the people whom it was meant to serve.

It is indeed a most astounding pass to which we have come, otherwise no protest from the people would have been heard. Governments, parties, money systems—anything that exists for their service is safe.

So simple a key as this unlocks the whole mystery and becomes a clue to the chaos. But it is doubtful if those in power will ever use it. Were they wise enough to use it now, they had been far too wise to have come to their present pass.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Memoirs Dissipate Queen Victoria Legend

Wolseley Letters Latest to Reveal Ruler as Narrow and Arrogant

By W. P. CROZIER

TWENTY years ago, when Queen Victoria died, she had become a legend to her people. The criticism which had sometimes assailed her in her middle age had not only died away but had been so completely forgotten that such a thing had come to seem incredible. Her age, her bereavements, her prestige, the enormous success of her reign in every material sense, all combined to lift her to an eminence where the voice of critical judgment was entirely stilled. Of her political activities practically nothing was known by the people as a whole. The bulk of the nation saw only the surface of things and respected and admired a venerable lady who for more than 60 years had maintained the powers of England and the moral purity of her court.

On these grounds Queen Victoria still deserves all admiration. There is no legend there. But in many other respects the information which has accumulated since 1902 had brought disillusionment. It began even in 1903 with the publication of Morley's "Gladstone" which showed that when at last that great man, broken with age and labor in the service of his country, had to lay down the burden, even then Victoria had for him no word of gratitude for the faithful services of 53 years. When, four years later, Gladstone died, there were messages of grief and mourning from all quarters of the world such as had rarely been known in history, but when in 1894 he had his farewell audience of her, he himself recorded that "there was not a syllable on the past"—except a word of thanks for something done long before for a member of her own royal family. Gladstone had been a model of loyalty and discretion; what he knew never became known during his lifetime to the masses of the people who almost worshiped him. But since 1903 we have learned more and more how bitter and intense a partisan the Queen was in politics. As each succeeding biography of those who flourished under her is published—Disraeli, Salisbury, Dilke and Wolseley—together with the researches of Sir Sidney Lee and Lytton Strachey, the true picture of Victoria becomes more clear. The legend disappears. Capable, strong-willed, of high moral character she still remains. But she was also narrow and arrogant in mind, filled with an overweening sense of her own importance, a Jingo Imperialist in foreign politics, ready to defy the Constitution to get her own way, utterly devoted to "favorite" ministers like Melbourne and the shameless sycophant Disraeli, and an unrelenting partisan against Liberals like Palmerston and Gladstone.

The last revelation has come just recently in the letters of Lord and Lady Wolseley. Take on the one hand some illustrations of her relationship with Disraeli—"the old Jew" as many called him, "the old actor" as Strachey says he was, the champion of the Turks, the exponent of everything that English Toryism stands for. In flattering Victoria, Disraeli (to use his own expression) "laid it on with a trowel," and she swallowed the flattery with gusto. For her he was "The Faery." He wrote to her that her confidence in him was more precious in his eyes than rubies. It seemed to him that the primroses sent to him by the Queen must have been sent by the fairy queen Titania. In one of his letters to the Queen he says of himself, "He lives only for Her and works only for Her and without Her all is lost." And in reply the Queen wrote this sort of thing to him, "Would he not accept a Marquisate or Dukedom *in addition* to the Blue Ribbon (the Garter)? And will he not allow the Queen to settle a Barony or Viscounty on his Brother and Nephew? Such a name should be perpetuated!" On one occasion he surpassed himself with a letter to one of the Ladies-in-Waiting which was intended to be shown to Victoria and which said: "I love the Queen—perhaps the only person in this world left to me that I do love." Victoria delighted in it all.

Her attitude toward Gladstone was astonishing. She accepted Disraeli's spiteful references to him as a matter of course. She stigmatized the action of the country in returning him to power instead of her own favorite as "unnatural," "mad and unreasoning" and "disgraceful," so that she was "shocked and ashamed." She declared (in writing to the defeated premier) that "of course I shall not take any notice of Mr. Gladstone, who has done so much mischief" and she affirmed positively that she would not send for Gladstone to form a ministry, although she was ultimately compelled to do so because it was he and he alone that had won the election for the Liberals and he alone that had a majority in Parliament. Not only, however, did Victoria cherish the most violent dislike for Gladstone but she displayed it openly both to her intimates and to guests at the court. It was from the court, therefore, that the bitter hatred professed for Gladstone by the English "governing classes" really derived its impulse. This is the account given by Lady Wolseley of an evening at Windsor:

So we sat down together, the Queen and I. She was in a black silk dress made anyhow and nohow, and a lace shawl over her shoulders. To repeat the conversation is more than I can do. It was principally about Egypt, but with an occasional side wave to Gladstone and politics. Rather interrogative and ejaculatory on her part, submissive on mine. She has a more changing expression than anyone I can think of. A very bright young smile, when her face lights up and she shows her gums and some little teeth in her upper jaw. Then she has another expression when she wants to emphasize her disapproval of Mr. G.'s meanderings and maunderings, her mouth tightly drawn down at the corners, and her eyes fixed angrily not on me, but on space, when her accent becomes more foreign and there is a little action of the hand—"First they will (hand advanced), then they won't (hand drawn back), and then they will again when it is too late. Always the same, they seem afraid."

And on another occasion, with regard to her Liberal ministers:

She said, "I have been obliged to be very rude to them all, they are so dilatory and tiresome." She said although she wants rest, she dreads to go abroad, "for I never know what they will do when my back is turned."

At times she found it impossible to restrain her anger. Lord Hartington (afterward Duke of Devonshire and secretary for war in the 1880-1885 Gladstone ministry) is reported to have said that on one occasion she "rated me as if I'd been a footman." The whole of the Gladstonian idea—liberal, anti-Turk, pro-Irish—was abhorrent to her. In the crisis of 1878 which led to the Russo-Turkish War she was furiously and violently anti-Russian. When leading Liberals and Radicals held anti-Turkish meetings in London she affirmed that "the attorney-general ought to be set at these men." She repeatedly threatened abdication if the government were submissive toward Russia ("the great barbarian"), wrote three letters in a day to Disraeli demanding war and cried impetuously, "Oh if the Queen were a man, she would like to go and give those Russians, whose word one cannot believe, such a beating! We shall never be friends till we have it out." Did Victoria ever think who it is that pay in precious lives and shattered homes when princes "have it out"? Perhaps one ought only to be glad that Gladstone at least could never claim, as did the unctuous Disraeli, that Victoria was his "Guardian Angel" to whom "having given his duty and his heart," he had nothing more to give.

But Queen Victoria had never any sympathy with liberalism in any of its aspects. Sir Charles Dilke described her as "wanting to take everything everywhere in the world and to keep everything if possible." Least of all was she friendly toward the efforts of small peoples—in Italy or Ireland, for instance—to establish their liberties. Hence her fierce attacks on Lord Palmerston when he displayed his sympathy with Kossuth, the Hungarian patriot, and with the brewers' draymen in London who mobbed General Haynau, the Hungarian woman-flogging tyrant. Her rage against Palmerston was extreme. These revelations must modify one's judgment of the part which she played in English history.

(C) Fred H. Kiser, Portland, Oregon.

When Lost Lake is calm it usually becomes a perfect mirror and in this picture we see the mirror used to great advantage by old Mt. Hood. The lake is 45 miles from Portland, Oregon.

Burbank to Celebrate 50 Years of Plant Work

Santa Rosa, His Home City, to Dedicate Memorial Garden of 40 Acres

By HARRY H. DUNN

LUTHER BURBANK, Sc. D., Who will be 74 years old on the seventh of March, 1923, and for whom all northern California is planning a Golden Jubilee in honor of his completion of half a century of work of plant breeding and development.

The Burbank family home at Santa Rosa, around which will center most of the activities of the various events of the Golden Jubilee celebration.

AN UNUSUAL man will be the recipient of an unusual honor from May 17 to 20 when men and women of the Pacific Slope gather at Santa Rosa, a few miles north of San Francisco, to celebrate the Golden Jubilee of Luther Burbank. This is not to honor Mr. Burbank's fiftieth year, for on the seventh of March he will be 74 years old; but to commemorate the fact that for half a century he has been engaged in selecting, breeding, developing, improving existing varieties of plants and creating new ones, to the vast benefit of agriculturists, horticulturists and florists.

This celebration, at which, according to present indications, there will be present the governors of four or five western states, and representative bodies of men and women, from every one of the 58 counties of California, will witness the dedication of a vivid and permanent memorial to the wonder-worker in the vegetable kingdom. This will be Burbank Park, 40 acres at the city limits of Santa Rosa, which is to be converted into a magnificent garden containing all the plants, trees and flowers which Luther Burbank has developed in his 50 years of work. This tract has been purchased for $32,500 by Santa Rosa, and plans call for the expenditure of $500,000 on the development and upkeep of this, destined, perhaps, to be one of the most important, and most valuable, of the world's botanical gardens.

In the center is to stand the Burbank Museum, in which will be kept records of Burbank's experiments. There also will be motion pictures of Burbank himself at work. Phonograph records of his lectures, and copies of his talks, as well as manuscripts of his books will be preserved. Comparative series of the seeds of plants, from those sent him by his more than 500 collectors in foreign lands, to those of the improved plants which he developed from these, will be on exhibition, so prepared that they will be available for study.

The whole idea of this memorial is to be educational, according to James G. Stafford, secretary-manager of the Santa Rosa Chamber of Commerce, which has been largely instrumental in arranging the Burbank Park and the Golden Jubilee celebration. In the garden of this 40-acre park will be planted, by families and in botanical order, those plants which Mr. Burbank has produced, from an annual crop of the celebrated Burbank potato, to the towering new walnut, which develops a tree more than two feet in diameter and 40 feet in height in 10 years, as compared with the 50 to 100 years necessary for the growth of the wild black walnut to the same size, yet which furnishes a lumber in every way the equal to that of the famous American wild walnut. These gardens will be kept by men trained in Mr. Burbank's experimental farms and the planting will be so arranged as to be available to students, botanists and plant-breeders of every nation throughout the year. In short, the park will be a perpetual school in plant breeding for the whole world, a unique memorial to an unusual man.

Mr. Burbank will supply the plants and attend to the supervision of their planting in the park, and he will arrange the collections of seeds and preserved plants, grasses and flowers in the museum. To him, this will be a small task compared to those which he has performed along the same lines in the last half-century, during which millions of plants have passed through his hands, from which he has selected a very few for perpetuation and improvement into new and better forms. Today, at the end of this half-century of plant breeding, he has more than 2,500 experiments in selection, development, breeding and training of plants going on at his experimental farms in Santa Rosa, more than enough to endow the average botanical garden with material for students of plant breeding for the next hundred years.

The work that he has done becomes little less than marvelous when it is remembered that each development of a plant—either from a wild form or from an under-developed domestic plant—requires years, sometimes more than a decade, to bring that plant to the point at which it is of the utmost utility to man. That is the objective of Burbank's work—the improvement of plant life to the point at which it is of the maximum service of food supply, clothing supply, or beauty, to man. It is his opinion, expressed to me, that the remedy for the present exodus, from the farms to the cities, lies in providing those who remain on the farms with such improved crop plants that, with modern machinery, they can produce more than a far greater number of men could produce with the present types of vegetables, grains and fruits.

And this is only one of the many unusual ideas which have come to this plant-wizard in the 50 years of his close contact with the vegetable kingdom. He believes that plants are much like human beings, that from plants he has learned a great deal about men, and that children can be developed, trained and improved, in the same manner in which plants have been so improved by his master hand. He has shown that plants are amenable to training, from the time they burst from the clod to the sunlight, just as animals are trained to man's service, and better breeds developed. He has proved that the bad traits in a weed can be crossbred out of it through the wise guidance of man's mind added to Nature's principle of selection. He has learned that all life has developed by the survival of the fittest, and he has acquired the ability to do with plants in a decade or two the same things that Nature would require several centuries to accomplish. To him, the crossing of types is responsible for all variations in human life, just as he has proved it to be responsible for all variations and developments in plant life. By this crossing and selection he has created—not merely developed—actually *created* new species which never before existed.

"Life is self-expression—a challenge to environment," Mr. Burbank said to me at his home in Santa Rosa. "Life is action in certain definite directions, based on mechanical or chemical changes. In Nature, we find varied animate and inanimate forms of life, many of which have motions—some of which in the higher forms we call emotions. These sometimes end in action; at other times in thought. What man can do knowingly in the breeding, selecting, developing and improving of plants, that Nature is doing blindly and much more slowly. Just as the best of plants are produced by wise selection, crossbreeding and development, so mankind may be improved through the succeeding generations of human children. This cannot be done, however, in either plants, animals or man, by blind crossing, for the better types so produced are only accidental."

Mr. and Mrs. Luther Burbank—and the famous Burbank dog—in front of their home in Santa Rosa. This large house is now covered with climbing vines of new and beautiful flowering varieties, developed from wild vines from all over the world by the plant magician.

Every one knows the Burbank potato, of which California alone produces and ships more than 182,000,000 pounds every year, and which is grown in every habitable country. Yet not every one knows of the hundreds of other vegetables, cereals, fruits, nuts and flowers whch have been created, developed and improved by the hand of Luther Burbank, speeding up and directing the processes of Nature. There is a new asparagus, almost as large as the shoots of the bamboo, yet more tender than any yet grown; there is an artichoke whose blossoms are three to four feet in circumference; there is a sweet corn which produces 12 rows of large kernels to the ear, compared with the eight rows usually produced by corn; there is a pop corn whose popped kernels are masses of fluffy white three times as large as those from the original pop corn. He wanted a sunflower which would not turn its face to the sun, thereby fooling the seed-seeking birds, and which would grow close to the ground, foiling the wind, so Luther Burbank took the known sunflowers, and by crossbreeding and selection, produced a sunflower only three feet in height, with blossoms 18 inches in diameter, turned toward the ground.

Care and work, properly directed, always will produce good results, with either plants or human beings, in the belief of the Santa Rosa plant expert. He showed the truth of this theory when, beginning with the ordinary tomato, he produced a tomato which bears two full crops a year, and from whose fruit the skin peels easily without scalding. He took the common well-known chive, and gave it a flower like a freesia, so that it became a beautiful border plant, as well as a vegetable. From plants of the *Solanum* family, he produced a fruit almost exactly like the huckleberry, called the "Sunberry," growing on a plant not unlike the tomato. He crossbred a number of varieties of strawberries, and produced an ever-bearing vine. He took the thorns off the blackberry, as he also had done from the cactus, and to take the glory from the Mexican pepper growers, he developed, from their own seeds, a pepper nine inches long and four inches thick, the largest pepper ever grown.

"Agriculture is the foundation of civilization," said Mr. Burbank, "and to bring agriculture to its highest point we must furnish the agriculturist with better, more productive crops. We must make every acre of a farm produce not only more, but better foodstuffs." Following these lines of belief, he started to provide better grains for the farmer. He developed a flax yielding a limpid white oil, 12 per cent more in quantity per pound of seed than any other known flax. After several years of close application, he presented grain-growers with a wheat adapted to short seasons, arid soil and dry climates, ripening weeks earlier than other wheat, as well as more resistant to disease. It has taken first prizes throughout Canada and the United States, and is now grown from Tasmania to Alaska. Then Mr. Burbank extended his operations to oats, rye, barley and even a new forage grass, known as Sudan-Sorghum.

"Man needs beauty as well as utility around him, to develop his life," Burbank said to himself nearly half a century ago, and thereupon set his hands to a few

Boys Who Back Subsidy Sail—on British Ships

Delegates Who Think Lasker Demand Should Go Through a Bit Inconsistent

A NOTABLE meeting of The International Chamber of Commerce will be held at Rome in March. One hundred and fifty directors and officers of chambers of commerce and boards of commerce in the United States will sail from New York on the Cunard steamship *Coronia,* cruising through to Egypt, Constantinople and other Mediterranean ports, disembarking at Naples in time to reach Rome for the notable gathering. The delegates and other representatives of America's leading civic bodies come from the principal cities of the United States; *they are identically the same ones that the National Marine Association induced to endorse the Lasker ship subsidy bill.*

Now, why did these American civic bodies, that are said to be so anxious to have the American flag become the advance agent of American commerce throughout the world, charter a British ship to carry them to a gathering where they will meet and deliberate with the very forces from every country of the world that hold, perhaps, more than any other class of men, the commerce of the world in the palms of their hands? The United States has hundreds of ships, many of them the most magnificent the world has ever seen, and all of the representatives from the different countries of the world know we have them. What effect will this to-be-historic pilgrimage sent out by our most influential commercial bodies on a British ship have upon the foreign representatives of commerce in their respective countries as regards American commerce and shipping? Let the reader answer. Our British cousins will smile, no doubt, likewise our Latin second cousins, and the shrewd Orientals. Who was it said Great Britain had a lobby here to try to defeat the ship subsidy bill? If it is true they certainly have made a "killing" with the chambers of commerce and boards of commerce of the United States. What was the Shipping Board doing with their high-powered men that they let such important and vital business get away from them? I asked an official of the United States Chamber of Commerce in Washington, who is a delegate to the Rome Meeting, about this, and called his attention to the fact that this great American organization had given strong endorsement to the ship subsidy bill. He replied that he, personally, as well as other members of the Institution, and some going from the city commercial bodies, prefered to travel on a British ship. "Wet?" I pressed. His answer was amiable, but vague. I then asked an official of the Shipping Board about the matter. He was a bit embarrassed, but after a hesitation sentence said: "The Board didn't have a ship available." This, of course, is rank nonsense. Great Britain always has a ship available where there is any business. And this voyage of our leading representatives of our great commercial interests means far more than the money expended for the trip. These American commercial pilgrims will steam into Italy under the British flag and not under the American flag! Consistency seems to be only a word in Mr. Webster's Dictionary; applied consistency is a jewel, if I may change the old saying: "Consistency thou art a jewel."

Not Government Banks

AS ACADEMIC as it may seem, there is a widespread misunderstanding among the people regarding the Federal Reserve Banks. Repeatedly, we hear men speak of the Reserve Banks as if they think they belong to the government. They do not belong to the government any more than do the National Banks. The Reserve Bank Act divided the United States into Reserve districts and the number of such banks are limited but the number of National Banks that may be organized are not limited, under certain conditions

The Federal Reserve Banks belong to the National and State Banks and Trust Companies that are their members. Uncle Sam has no more ownership in them than he has in National Banks, or other banks. Of the approximately $3 000,000,000 of gold, appearing in the government reports as "being in the Treasury," $2,186,000,000 is in the Reserve Banks and does not belong to the government at all. The government requires the Reserve Banks to have gold back of the Reserve Bank Notes; these notes are, in the language of Treasury officials, simply warehouse receipts against the gold owned by, and held by, the Reserve Banks.

THE investigation of oil companies, which began December 14, is now in full blast before a Sub-Committee of the Committee on Manufactures of the Senate and promises to last for some time. Washington is filled with oil magnates from every oil-producing district of the United States. Senator La Follette is "at the bat" every day, and Smith Brookhart of Iowa wields a club in the Sub-Committee, metaphorically speaking. Many attorneys are here to advise the high officials of the oil companies, under fire. Usually rumors in Washington may be safely discounted fully 85 per cent. But from the tense atmosphere hovering about the city, over this investigation, there is something of a conflagration looked for after consideration of the testimony now being taken. On the surface it involves the privileges given certain oil companies to the "Tea Pot Dome" oil fields in Wyoming but it is more far reaching than this.

THE United States has had armed forces in Germany ever since the Armistice went into effect, November 11, 1918. This government has expended some $300,000,000 for our armed contingent on German soil since that date. But all our soldiers stationed at or near Coblenz have arrived home. Yes, Germany was to have paid the expenses of our armed forces there, but has she? That is another story.

One of Mr. Harding's loudest campaign promises was to get our army out of Germany immediately. It is now nearly two years since Mr. Harding was inaugurated as President. It is not the intention of the "Unofficial Observer" to pass judgment as to whether the President was justified in keeping our soldiers there all this time or not. But it is reasonable to call attention to one of his definite campaign promises. Perhaps he had the best of reasons to change his mind and his policy in this regard from the "outside" view he had before he assumed the Presidential office and came into possession of the "inside" view after he got into office. At any rate, it proves once more that it is easier to make political campaign promises than it is to keep them. If the ordinary man in private business were as neglectful and indifferent of his promises as are our men, as a rule, who are handling the nation's business, the man in private business would soon lose his "commercial rating" and go to pieces.

As to Army in Europe

MANY Republicans in Congress, and out of it, have differed about the policy of keeping a United States Army in Germany. The same may be said of the Democrats. It is safe to say that a large percentage of Republican Senators, Congressmen and politicians are severe in their criticisms of the President for his "lack of decision," not only in regard to our Army on the Rhine, but in all other matters. But politicians are notoriously cowardly and, heretofore, when they talk this way, they often caution you that they are not talking "for publication." But now some Republican Senators and Congressmen speak out very boldly in their criticisms of the President.

When it was announced that France was sending a large army into Germany the decision to remove our Army from there was made immediately. It is interesting that both Germany and France wanted our soldiers to remain there, which is about the only matter they are in concord on.

It is stated "unofficially" that the government is in possession of a report from Roland W. Boyden, this government's "Unofficial Observer" with the Reparations Commission, bearing upon the present crisis in the Ruhr. But the State Department has not seen fit to impart any of the findings of Mr. Boyden to the public. An intelligent public could use information as to German coal and some other matters at this time, and it is the positive opinion of observers here that the people are entitled to the information gathered by Mr. Boyden. He did make the statement in Paris that the terms of the reparations were "impossible."

The German ambassador in Washington has just given out a statement. The German ambassador admits that Germany is in default some 2,000,000 tons of coal on the 1922 account. In other words, Germany should have delivered some 13,000,000 tons of coal but has found that assessment beyond her capacity. In 1921 Germany mined 332,000,000 tons of coal and in 1922 about 335,000,000 tons. This is in excess of her pre-war output. Out of this enormous output Germany has been unable to deliver 13,000,000 tons. Now, we in America are puzzled to understand why Germany could not manage to pinch itself for about four per cent of its coal output to make payments on what is considered a just debt. Mr. Boyden's voluminous reports in possession of the government might give us some light on the subject.

The German ambassador also says that his country is in default "only" 20,000 cubic meters of lumber and 135,000 telegraph poles. Why should there be such an inconsiderably small shortage? There may be good reasons but we do not know them positively. Since the Armistice Germany has built more than 2,000,000 tons of shipping in which much timber must have been used. She is constructing a great deal of housing and has fully restored her railway equipment. In all of this work Germany has undoubtedly used vast quantities of timber. Of course, Germany had to do all of these things in order to exist and pay the reparations. In this construction work Germany has increased her wealth more than $5,000,000,000, it is stated officially.

One year ago the Washington Armament Conference was in session. The Naval "scrapping" treaty entered into by and between the United States, Great Britain, France, Italy and Japan, as well as other treaties entered into between the five powers named and certain other countries, are all "dead letters" and the conditions are practically the same as if there had been no conference called, only incurring heavy expenses, upon the debt-ridden nations called to Washington. The treaties have no force until they have been ratified by all the signatory powers. It is true that Japan and England have ratified the treaty. The United States Senate has given its consent, but the actual certificate of ratification has never been signed by the Executive. Of course this is a routine matter but what is the use, so long as France and Italy have not ratified the treaty, with the prospect that these two powers never will ratify it? England and Japan have both passed laws prohibiting their shipbuilders from building war ships above 10,000 tons in size to sell to other nations; this under severe penalties of imprisonment and fine. But the United States has enacted no such law. For instance, if the United States had passed such a law no shipbuilder of this country could sell war ships, beyond the limit named, to Argentina or any other country. It looks very much as though England and Japan went into the Five Power Pact in good faith and as far as they could have lived up to its terms. But without unanimous ratification by each and every one of the five powers it has no force whatever as stated. The life of the treaty was 15 years. If, perchance, France and Italy should ratify the treaty in five years from the date the treaty was drawn up at last year's Washington conference, it would have but 10 years to run; if it should be unanimously ratified in 10 years from that date it would have but five years to run. It looks very much as though the Washington conference of a year ago accomplished nothing whatever.

Senate Throws Out Seed

THE Senate decided that it would no longer countenance the yearly waste of $360 000 in the free distribution of seeds. This ends a custom which has endured for half a century. Amid almost tearful and impassionate speeches, on the part of Senators to reinsert the "time honored" seed provision in the appropriation bill, it was voted down and out.

The government, through the Department of Agriculture, always bought the seeds in the open market. They were packed and mailed at public expense. There was always a clamor for them as there is for anything that is given away. Many Senators and Congressmen looked upon Uncle Sam's free seed distribution as having considerable political value for them. They were, as a matter of fact, little more than pleasant remembrances from the politicians who sent them. Senator Heflin, of Alabama, made a vigorous plea to "save the seeds." He spoke for two hours but to no avail.

AGAIN the waste, neglect and carelessness of the public business has been brought to light. Documents relating to every important period of this country's history are stored in every available space in departmental buildings as well as in storage warehouses and rented buildings. A large part of these valuable papers have been lost entirely. In many instances they were stacked in basements and cellars and their location retained only in the memory of employes, many of them with this information, now being dead. An investigation reveals that the most valuable documents are stored, without the least regard for system, on wooden shelves, unprotected from the ravages of insects, rodents or fire. But this gross neglect, on the part of those in authority, cannot any longer be kept covered up.

The sad facts came to light in the plan to construct a National Archives building, in which to store the priceless fundamental documents of the nation. It will be a realization of the Mall development plan, if the proposal recently made to government officials is considered favorably. By substituting the proposed building in place of the three previously planned for the government site between Fourteenth and Fifteenth streets, Pennsylvania avenue and the Mall line, the archives problem would be solved.

Abrams, After Money-Seeking Trip to East, Branded Faker When Boston Tests Machine

His Refusal to Submit Claims to Investigation Under Scientific Direction Follows Lecture Clean-up

APPROXIMATELY 3,000 persons, many of them women, were gathered in Carnegie Hall, New York City. Dr. Albert Abrams, "The San Francisco Miracle Man," was to lecture and to demonstrate according to the announcement that wonderful "Oscilloclast" by means of which he avers he can tell almost everything except the name and the post office address—and it is on record that he has alleged that he can almost do that—of anyone.

This expectant audience was not the usual type that gathers in Carnegie Hall. It was neither radical nor "intellectual." In the main, it was far more pathetic. In New York, as in all other cities, there are thousands of ill who are seeking a cure and who see in each newly heralded method or device or course the fulfillment of their hopes. Consequently there were many who were victims of disease—women with sunken cheeks and suppressed, but meaningful coughs, young men with unmistakable evidences of blood diseases, a man with a bandage on his face which did not conceal entirely the unpleasant discoloration of cancer and many others with symptoms readable to the layman unaided by an "Oscilloclast."

Physicians were there including able men of their profession who were skeptical but who were not neglecting opportunities to acquire knowledge—one brought his medicine case with him evidently on his way back from a call—writers on medical subjects for technical publications, newspaper writers, several men of considerable scientific attainments, some frank unbelievers, some disciples of ERA—the symbol of the "electronic reactions of Abrams"—and those who were open to conviction.

Judged as a whole, it was almost an ideal audience for the message that Dr. Abrams professed to bring, that is, that he could diagnose hidden disease; that diseases that had been a scourge of humanity need be so no longer; that certain vibrations would disclose the evidence of tuberculosis or cancer or any other disease and that the disease having been ascertained, vibrations could be brought into play to destroy it.

The ballyhoo for this meeting had been perfect. It began even before this man, whom the American Medical Association calls a faker of great magnitude, came to New York. The week before he arrived, he had been interviewed in Chicago and the press association wires carried stories that were duly printed in the New York papers along with announcements of the coming lectures. The Chicago interviews stated in substance that Dr. Abrams was able to tell merely by hand-writing specimens the age, sex and physical condition of the writer and even if he were living or dead. Obviously, the visit of such a wonder was well worth advance preparations.

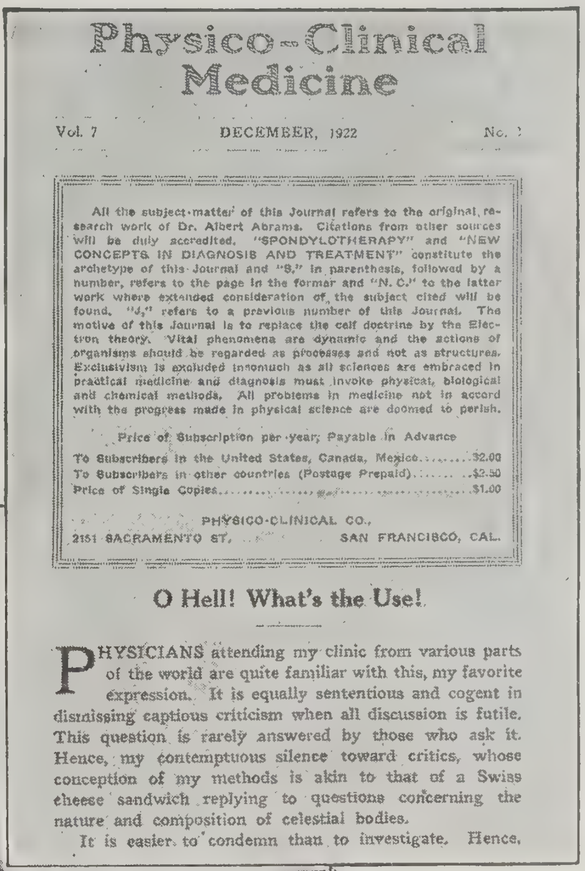
Abrams' residence and office at 2151 Sacramento street, San Francisco. He has just purchased a small hospital farther down toward the business section of San Francisco and is erecting an addition to it. Persons from every one of the seven automobiles shown in this photograph were in Abrams' office, either "taking treatment," or studying his methods when this photo was made. Usually there are more than this number of cars parked in front of his door, to which the arrow points, the building being the low one with the flagstaff surmounting it.

Hence when the doctor and his secretary arrived in New York, everything was in readiness. There was no secret concerning the hotel he had chosen and every city editor in town sent out the best man or woman available. Nor did Dr. Abrams shun his visitors. His door swung open readily and he had ample time for interviews.

Man is an electrical machine, Dr. Abrams told the ladies and gentlemen of the daily press; every organ, every tissue, every drop of blood is teeming with radioactive vibrations. Love, hate, fear, jealousy, each human emotion is only a matter of vibrations. Table tipping, rappings and all other alleged spiritualistic phenomena are due to this same agency and not to spirits.

"A single drop of blood with its billions of electrons is a condensation of the multitudinous vibrations of the human body," said this somewhat roly-poly scientist. "Everything in nature has its natural period rate of vibrations as is shown by the response of the harp to the tuning fork. Disease is merely the expression of a certain vibratory rate. Something with a similar rate can be imposed upon it and destroy it."

Whatever may be said about Dr. Abrams it must be admitted that he is a good judge of news values and knows how to connect his science with timely topics. When he was in Chicago, the Tiernan case in South Bend, Indiana, was engaging the attention of thousands who read the daily newspapers, the parentage of a baby being in question. Dr. Abrams announced that he, if given the opportunity, could settle the matter to the satisfaction of the courts and everyone else concerned. Previously, when there was a similar question in the Stillman case, his interviews had to do with the parentage of that child. A drop of blood would determine it.



Physico-Clinical Medicine

Vol. 7 DECEMBER, 1922 No. [illegible]

All the subject-matter of this Journal refers to the original research work of Dr. Albert Abrams. Citations from other sources will be duly accredited. "SPONDYLOTHERAPY" and "NEW CONCEPTS IN DIAGNOSIS AND TREATMENT" constitute the archetype of this Journal and "S," in parenthesis, followed by a number, refers to the page in the former and "N. C." to the latter work where extended consideration of the subject cited will be found. "J," refers to a previous number of this Journal. The motive of this Journal is to replace the cell doctrine by the Electron theory. Vital phenomena are dynamic and the actions of organisms should be regarded as processes and not as structures. Exclusivism is excluded insomuch as all sciences are embraced in practical medicine and diagnosis must invoke physical, biological and chemical methods. All problems in medicine not in accord with the progress made in physical science are doomed to perish.

Price of Single Copies..........$1.00

PHYSICO-CLINICAL CO.,
2151 SACRAMENTO ST. SAN FRANCISCO, CAL.

O Hell! What's the Use!

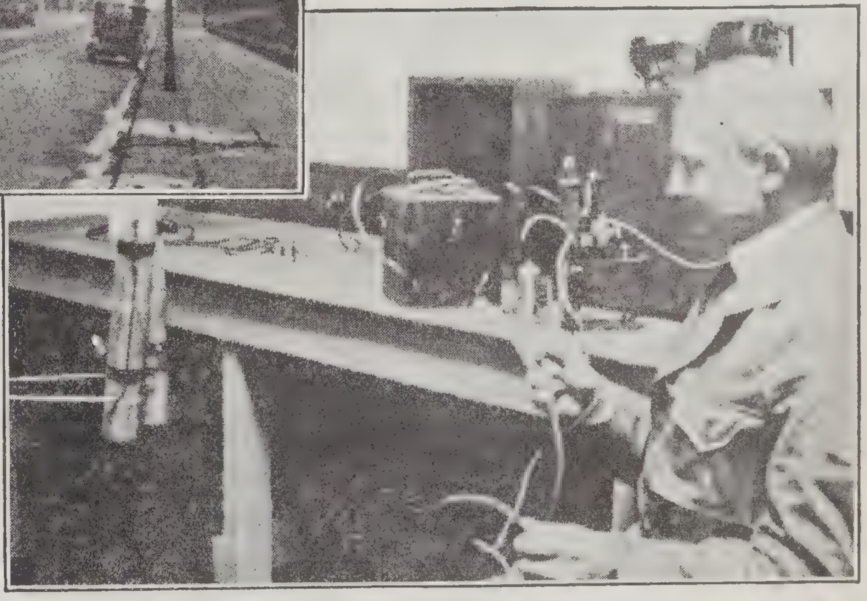
PHYSICIANS attending my clinic from various parts of the world are quite familiar with this, my favorite expression. It is equally sententious and cogent in dismissing captious criticism when all discussion is futile. This question is rarely answered by those who ask it. Hence, my contemptuous silence toward critics, whose conception of my methods is akin to that of a Swiss cheese sandwich replying to questions concerning the nature and composition of celestial bodies.

It is easier to condemn than to investigate. Hence,

The first page of Dr. Albert Abrams quarterly medical journal for which he exacts $2 a year from every one of his patients and "desciples."

When he reached New York, Thomas Lawson, Boston financier, was missing and there were many who were wondering where the broker was. Dr. Abrams said that he could settle that also. If a specimen of Mr. Lawson's handwriting was submitted to him "At Carnegie Hall tomorrow night—the night of his lecture—I will undertake to tell pretty nearly where Mr. Lawson is," he told newspaper men.

The "miracle man" said much more, but there will be reference to his further utterances later as the Carnegie Hall audience has been left waiting long enough now. The result of all the publicity was that enough persons to fill the hall paid their admissions. Some of the more anxious crowded back of the stage to greet the "miracle man" when he entered.



How "treatment" using the Abrams Oscilloclast is taken. Unfortunately for the pretentions of Dr. Abrams, there was also attached an extremely sensitive galvanometer, which showed that no measurable quantity of electricity was passing from the Oscilloclast to the patient. So delicate was the galvanometer used that one man, disconnecting the Oscilloclast, and holding both terminals of the galvanometer, made its needle move, a thing which the Abrams machine could not do. There is more electricity in a handshake than there is in the Oscilloclast.

The time of the lecture arrived but no Dr. Abrams. New York audiences being well trained to lateness and generally late themselves, waited as patiently as possible. At last a young man walked from the wings, put a table in position and on it placed some kind of an apparatus from which wires dangled. These were connected and he disappeared. Almost all eyes rested on that contrivance. Undoubtedly it was the wonderful Oscilloclast by which it could be told whether Johnny loved Mary or the next baby would be a boy or a girl!

Another long wait and a little murmur went through the audience. Dr. Abrams had arrived!

Briskly he brushed through those clustered around the rear door. With him were several professional appearing men—his disciples as was revealed later—and after a short consultation behind the scenes, they advanced on the platform.

At last they were gazing on the "miracle man," the "man of the house of wonders," the man persecuted by the medical profession, the pioneer in a field of science which offered such vast possibilities to sufferers, a man who could drive a bunch of germs into one part of the body, paint them yellow and kill the whole outfit! Even to hardened New York, this was an epochal moment.

True the "miracle man" did not quite typify the character for he did not have the appearance of one who has spent many years delving deep into science, one who has sacrificed and borne heavy burdens that the truth might prevail. A broad-shouldered, rather short, chubby person, with a pink baldish head, with the outward indications of a "good feeder" he was rather more the personification of those who attend conventions of the more convivial brotherhoods than of a man who had all but discovered the great secret of life.

The preceding speakers took considerable time. Naturally their subject was Dr. Abrams and to him they paid glowing tributes; they cited his courage in defying the organized medical profession; they told how over-worked he was and how he was benefiting humanity; how he had fought to establish the ERA and what great benefits this ERA would bring to the world. They described his methods in full; they cited case after case of disease diagnosed with the patients miles and miles away.

The eager listeners were told how by merely placing a drop of blood soaked up by a piece of common blotting paper, into the chamber of an electrical machine, the blood drop being near an electrode, with another electrode connected to the body of a young man, Dr. Abrams could tell the sex, the presence or absence of disease and so on to the parentage of the one who had furnished the blood!

The young man, known as the "subject" was merely an indicator as by tapping on his body—"percussion"—the electrical reaction was tested. When a "dull spot" was found Dr. Abrams had the information he wished.

(Concluded on page 15)

What Censorship Is Doing for Washington Art

Federal Commission Does Much for National Capital by Its Good Advice

By CARSON C. HATHAWAY

TO CENSOR or not to censor is the question of the day. Half of America is said to be attempting to regulate how the other half shall live. The regulations on free speech during the World War and the adoption of the prohibition amendment have created a certain amount of resentment against arbitrary legislation. Censorship, however, is not always to be condemned. While one alternative may be tyranny, the other is anarchy. Between the two extremes there is a reasonable middle ground. As an illustration of the value of censorship, there may be considered the experience of the Commission of Fine Arts in Washington, D. C.

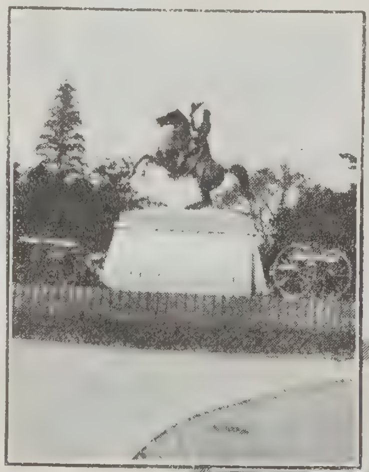
The duties of this commission, which was authorized by Congress in 1910, include not only advising on the location of statues, fountains and monuments erected in the District of Columbia, on the selection of models for statues and similar works of art erected under the authority of the United States, and the method of selection of the artists for their execution, but, in fact, all questions involving matters of art with which the Federal Government is concerned. The members of the commission are appointed by the President of the United States for a period of four years. Before considering what the commission has done it may be well to call to mind the background on which it had to work.

In 1792, Pierre L'Enfant, a French soldier and engineer who came to this country with Lafayette, laid out plans for the development of the capital city under the supervision of George Washington and Thomas Jefferson. They were particularly fortunate in the opportunity which lay before them. European capitals had been beautified only after centuries of occupation. Most of them are commercial centers containing factories, warehouses and smoking chimneys. In 1792 Washington was almost a wilderness with no works of man to mar its possibilities.

The plan in the minds of the founders was a combination of simplicity and potential grandeur. The city of the future was conceived to be primarily a seat of government and not a center of commerce. At one end of an axis a capitol building was to be erected as the home of the legislative branch of the government. At the other end of the axis was to be the residence of the Chief Executive. Between the two was to run a broad avenue lined with beautiful buildings and skirted by parks.

Many features of this plan have been carried out, but it lacked one element. It provided no machinery for the supervision of the work. Just as President Harding has insisted that before a soldier bonus is given executive approval, Congress must provide for the means for payment, so George Washington might well have provided for a directing mind behind the impressive plan which he proposed. As a result of a lack of expert supervision over the development of the city, Washington contains frequent examples of poor art and faulty architecture. In Lafayette Park, just across from the White House, stands an equestrian statue of Andrew Jackson. His spirited steed is rearing on its hind legs. Andrew himself is not a striking example of manly beauty and the statue is admittedly inartistic, but it has been allowed to stand until it is now a landmark.

In front of the Federal Court House in Washington there stood until a recent date a statue of Abraham Lincoln. It was placed on a tall column with the result that the great emancipator's feet were the chief objects visible to the passer-by. Some individuals, more courageous than the rest, finally had the "work of art" removed and stored away amid the storming protests of many of the older inhabitants.

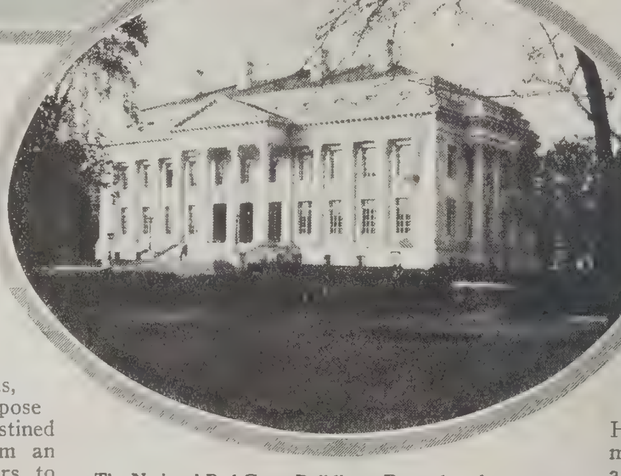


Statue of Andrew Jackson in Lafayette Park. This is in full view of any President who steps out on his front porch.

The Commission of Fine Arts was created, therefore, because it was recognized that there was a serious work for it to do. Art and architecture in Washington needed supervision so that future generations might be protected from the monstrosities erected during the current era. In the few years of its existence, the commission has created a permanent place for itself.

It has supervised the construction of the Lincoln Memorial, which has been called the finest gem of architecture in the New World. It has given advice and counsel in the erection of the Grant Memorial near the Capitol, the Washington City Post Office Building, the Jeanne d'Arc statue, the Red Cross Building, and many other buildings and monuments that have been commented on for their unusual beauty. It is rather a significant fact that the last report issued by the commission showed that it had passed on exactly 1,776 cases. As the year 1776 symbolizes American independence, so does the work of the commission stand for a new liberty in the field of art and architecture, an independence from false standards of municipal planning.

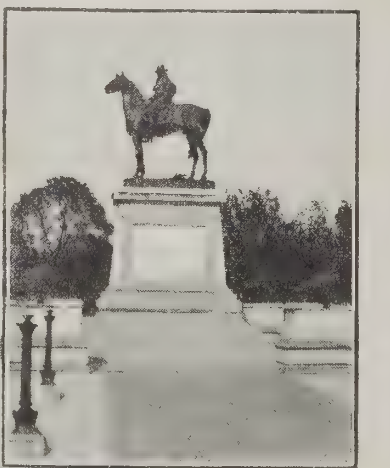
The Lincoln Memorial is a cameo in marble erected under the supervision of the National Commission of Fine Arts.



The National Red Cross Building. Erected to the memory of the heroic women of the Civil War. A fine example of the type of architecture fostered by the National Commission of Fine Arts.

One of the most difficult questions which the commission is called on to solve concerns the memorials to the participants in the World War. As soon as any great conflict is completed there is a desire to honor the victors. The signing of the armistice was the signal for the erection in many places in America of hastily conceived and poorly designed tablets, statues and fountains, erected for the ostensible purpose of honoring the dead, but destined to be severely criticized from an artistic viewpoint in the years to come. Many statues of American "dough boys" resemble the dough far better than they do the boys.

In Washington there will be no such memorials. The commission stands guarding the way. It takes the position that "art is long and time is fleeting" and that a far more satisfactory conclusion regarding memorials will be reached after months and perhaps years of deliberation. In its own words, "The commission believes that in time the issues of the war and its results and ideals will detach themselves from the confusion and conflicting emotions of the present and that the artist will be able to express something higher and more enduring than the incidents of strife and costumes of fighting men."



The Grant statue in the Botanical Gardens in Washington. The second largest equestrian statue in the world.

The Dupont Memorial Fountain in Washington, D. C., designed by Daniel Chester French and Henry Bacon. A beautiful fountain but a dry one, due to a depleted water supply.

Since the close of the World War, requests have been made for permission to erect in Washington a monument representing "Labor in the World War" to be 56 feet high and 12 feet in diameter, to weigh 350 tons and to cost $700,000; another proposal is to erect a memorial to the Negro soldiers and sailors; another to build a huge auditorium as a memorial to all our fighting men and, finally, a proposal to set up a tablet commemorating the services and sufferings of the 243,133 horses and mules employed overseas by the American Expeditionary Forces. And the war ended only four years ago!

The commission invites attention to the fact that the Grant Monument, west of the Capitol, has just been dedicated, although more than 50 years have passed since the Civil War. In this interval there has been an opportunity to plan a worthy memorial and the result is that the new statue meets with enduring architectural standards.

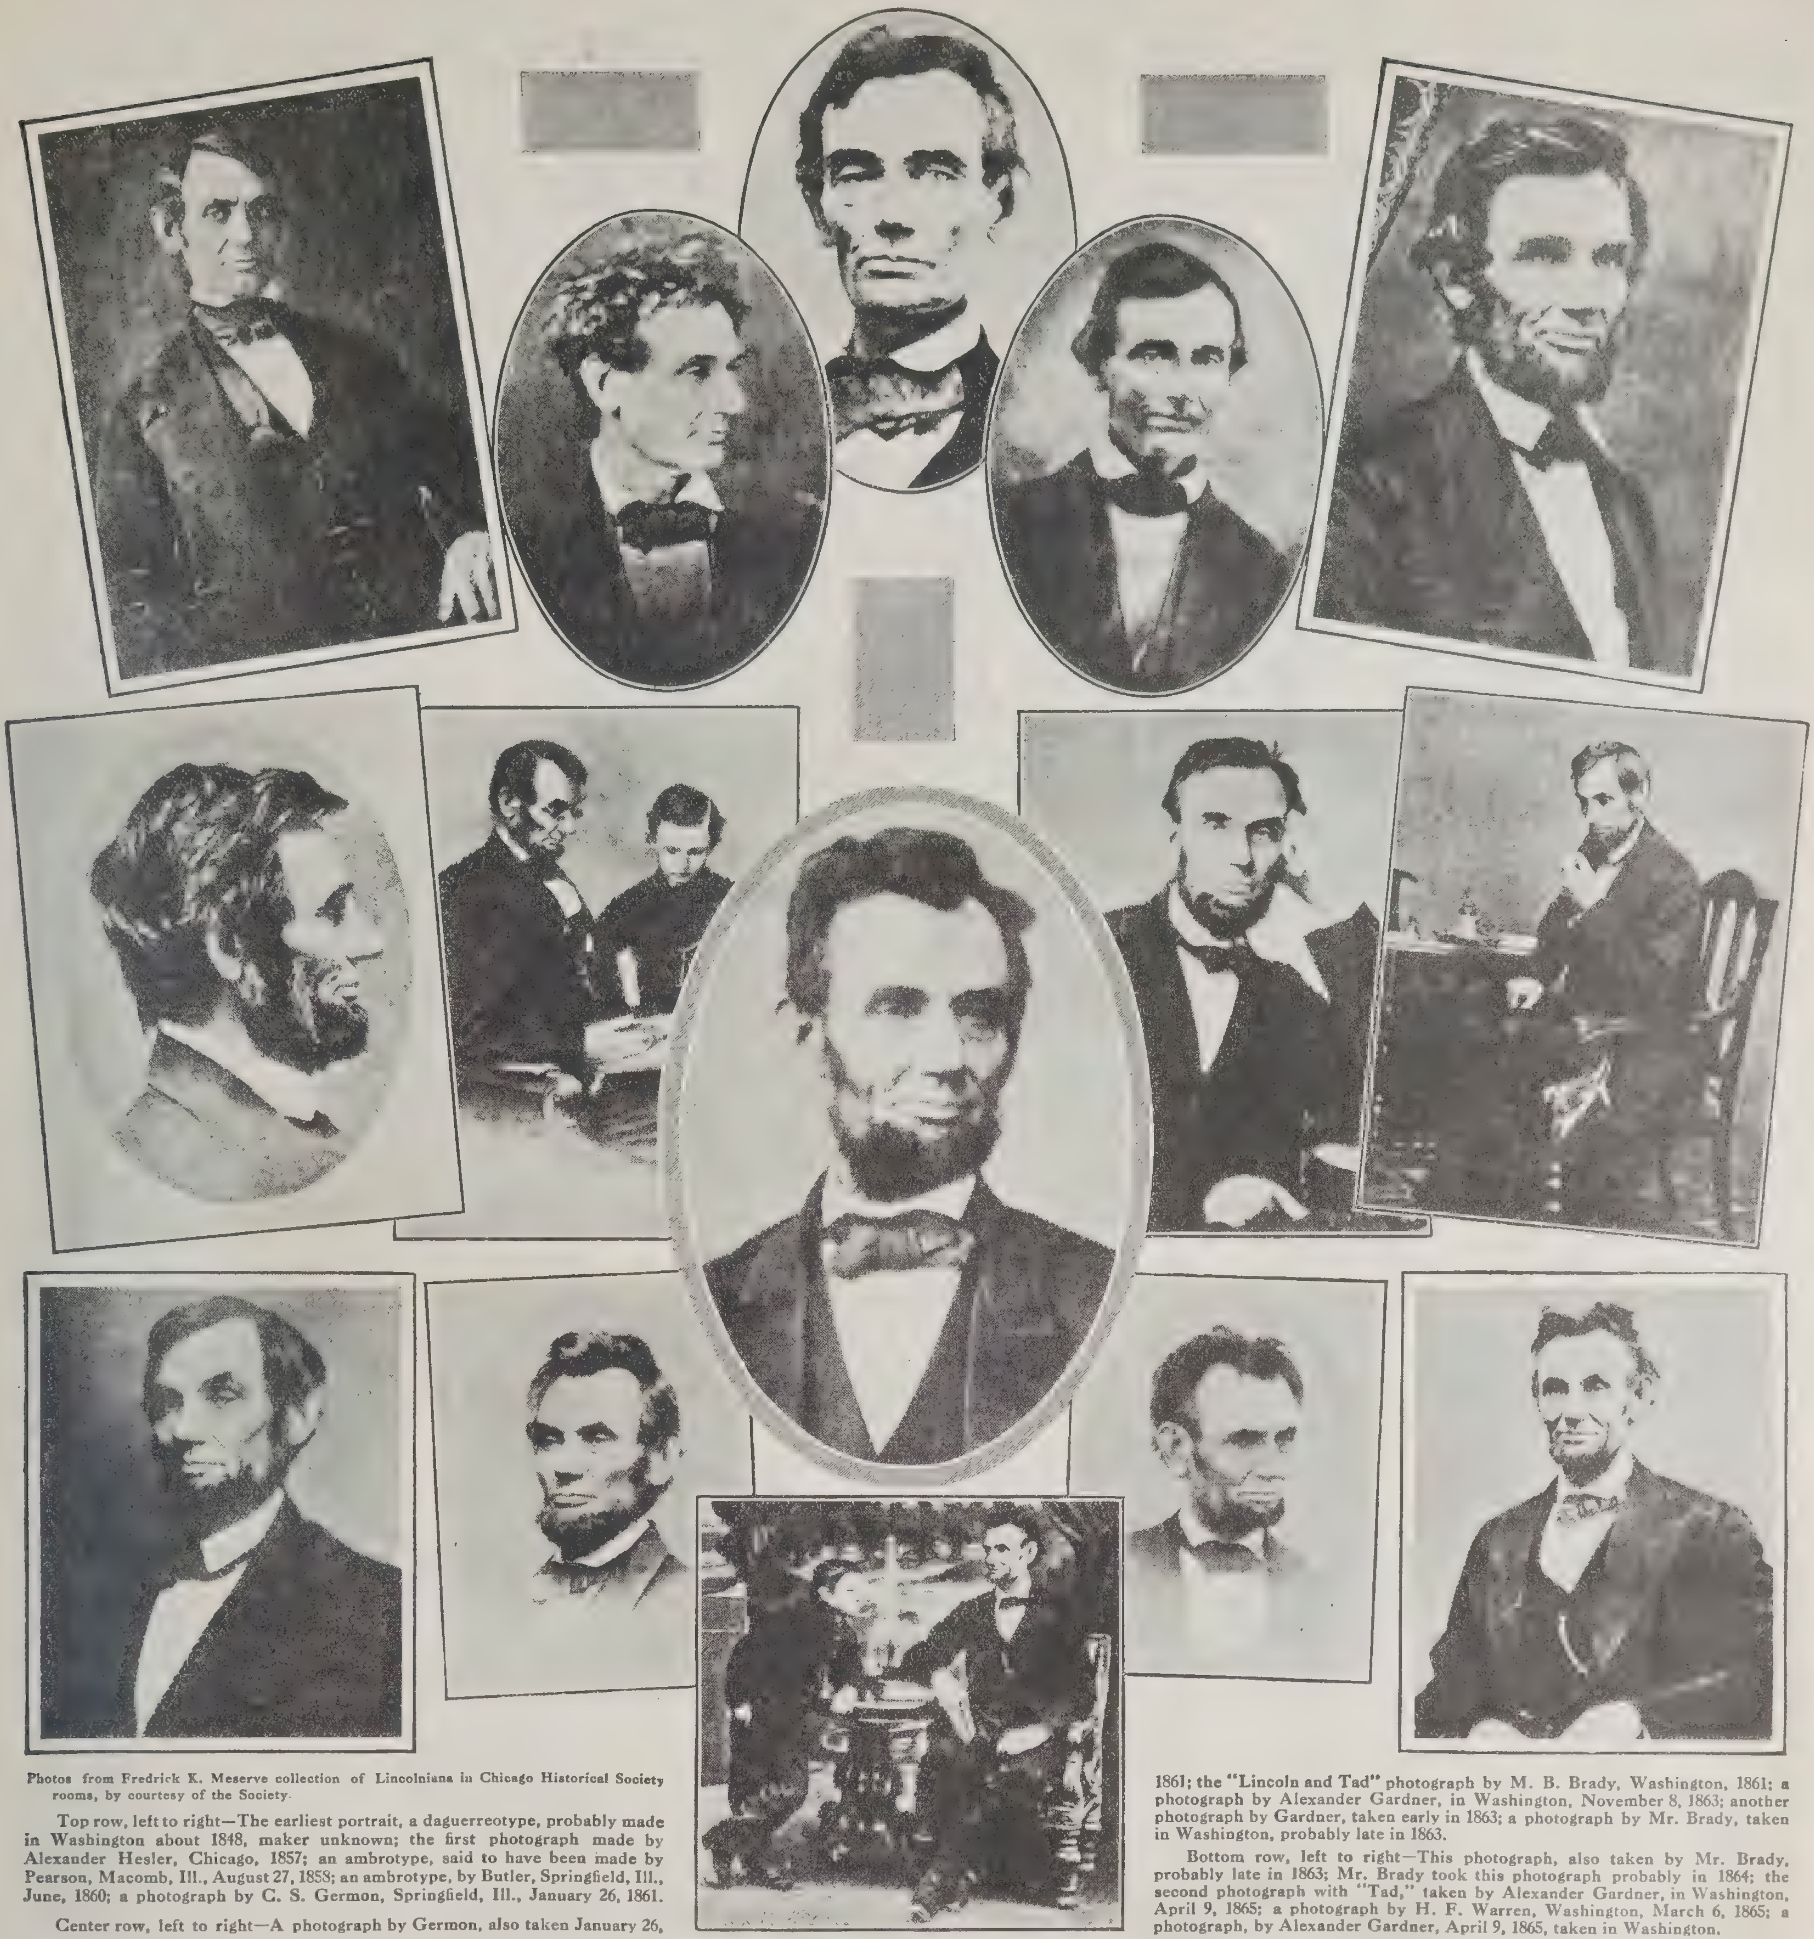
The commission has jurisdiction over the monuments which are erected in Arlington National Cemetery. The War Department has adopted certain general regulations governing the memorials there, but the commission is called on to pass on all important questions of policy. The result will be that in the years to come Arlington will be one of the largest and most impressive military cemeteries in the world. More than 1,000,000 veterans of the World War are eligible to choose Arlington as their final resting place and on the commission devolves the tremendously important duty of preserving this sacred spot in all its beauty.

Another of its obligations is to pass on all coins and medals which are issued by the United States Government. In the past our coins have been subjected to rather cynical criticism. The designs on them have ranged from Indians and Goddesses of Liberty to screaming eagles. American coins have had a tendency to be vociferous. It has been remarked that the eagle by which the Congressional Medal of Honor is suspended looks more like a chicken than an eagle.

It is only natural that in its work it has encountered some little opposition. Art is a matter of opinion and its standards are not firmly fixed. We have only to recall the controversies which have raged in American art circles in recent years over Barnard's "Lincoln" and MacMonnies' "Civic Virtue" to realize the type of problems the commission has been called on to face. It has succeeded with a minimum of friction. Perhaps this has been due in large part to the fact that it is composed of a group of recognized experts who have passed far beyond the amateur stage and who know art not merely from the twentieth century viewpoint, but from the viewpoint of the centuries.

It has included in its membership such men as Daniel H. Burnham, chief of construction of the Columbian Exposition; Frederick Law Olmsted, president of the American Society of Landscape Architects; Daniel Chester French, dean of American sculptors; Cass Gilbert, architect of the Woolworth Building; Thomas Hastings, member of the firm that designed the New York Public Library; Henry Bacon, architect of the Lincoln Memorial; James E. Fraser, sculptor, best known for his statue, "The End of the Trail," and thus the list might be prolonged. The membership of the commission has been such as to inspire public confidence in the sanity of its judgments.

The commission is not resting on its laurels. It has a program mapped out which will take years to complete, but which will add immeasurably to the beauty of Washington. Among its projects is an archives building to house the invaluable historic documents belonging to the United States. Up until a very recent date the original Declaration of Independence and the Constitution of the United States rested in a small safe in the State Department, constantly menaced by the possibility of fire. Congress has as yet refused to furnish the money, but its erection is only a matter of time.



Photos from Fredrick K. Meserve collection of Lincolniana in Chicago Historical Society rooms, by courtesy of the Society.

Top row, left to right—The earliest portrait, a daguerreotype, probably made in Washington about 1848, maker unknown; the first photograph made by Alexander Hesler, Chicago, 1857; an ambrotype, said to have been made by Pearson, Macomb, Ill., August 27, 1858; an ambrotype, by Butler, Springfield, Ill., June, 1860; a photograph by C. S. Germon, Springfield, Ill., January 26, 1861.

Center row, left to right—A photograph by Germon, also taken January 26, 1861; the "Lincoln and Tad" photograph by M. B. Brady, Washington, 1861; a photograph by Alexander Gardner, in Washington, November 8, 1863; another photograph by Gardner, taken early in 1863; a photograph by Mr. Brady, taken in Washington, probably late in 1863.

Bottom row, left to right—This photograph, also taken by Mr. Brady, probably late in 1863; Mr. Brady took this photograph probably in 1864; the second photograph with "Tad," taken by Alexander Gardner, in Washington, April 9, 1865; a photograph by H. F. Warren, Washington, March 6, 1865; a photograph, by Alexander Gardner, April 9, 1865, taken in Washington.

A Photographic Study of the Moods of Lincoln

WAS Abraham Lincoln the man of sorrows he has been pictured? Was he a happy-go-lucky fellow, who joked with his Cabinet officers, while the most serious events in the life of the nation were occurring? Was he always generous, indulgent, calm and strong?—or have we conventionalized him—standardized him, so to speak, to one spiritual portrait, as we tend to standardize him to one style of physical portrait?

A study of Lincoln's photographs shows that he experienced the gamut of emotions common to humanity; he was happy, on occasion, and at other times glum; often worried, and frequently sad, and it is known that he spent much time in earnest study. Of the countless engravings and paintings made of Lincoln during his life, many were mere caricatures, overdone or underdone. Photographs show him as he was. The unimaginative camera caught the subtle expressions that artists had failed to portray.

The first photographs of Lincoln were daguerreotypes, then came ambrotypes, and finally, paper prints from glass negatives. Daguerreotypes were first made in 1839. The process consisted of a highly polished silver surface, usually on a copper plate, chemically treated to receive the image in the camera. It was a slow process when first introduced, and required several minutes of self-control on the part of the subject before the portrait was fixed upon the plate. Only one portrait could be made from an exposure, so that, while the result was very beautiful in the perfection of details, it was too expensive a method to permit of general use. The first portrait accompanying this article was taken by the daguerreotype method. Apparently, the photographer has resorted to the use of a head rest to help his subject hold a pose.

The look of lively interest in his surroundings is nowhere in any of Lincoln's pictures more noticeable than in this, his earliest known photograph. It was taken in 1848, in Washington, while he was a Representative in Congress from Illinois. The tremendous strain of public responsibility had not yet placed its mark upon his features, his face had not yet become wrinkled and careworn. He was youthful and his optimism is clearly evident.

Lincoln was always willing to oblige friends and photographers by sitting for photographs, although it is never evident that he had made special personal preparations for the occasion.

A friend of Mr. Lincoln's once made arrangements for a sitting with a photographer in Chicago, so that members of the bar could get prints. Lincoln said at the time that he did not know why the boys wanted such a homely face. When he appeared at the studio, to keep the appointment, the photographer insisted on smoothing down his hair, but not liking the result, in a carefree schoolboy spirit of recklessness he ran his fingers through it before sitting. The result of this action can be seen in the second photograph.

The third portrait in the series herewith given was made in Illinois. He appears, in this picture, of a saintly, almost ascetic character; greatly sobered and very serious—almost haggard, as if with prophetic foreboding of the task before him. Someone has said, "Lincoln was not fit to be President until he became President." In this photograph we see Lincoln of Illinois in transition to Lincoln of the world and the ages. The task was descending on him. He was beginning to feel the cruel weight of his glorious mantle.

In the fourth portrait the shadow seems to have deepened. There is almost a hint of pain about the eyes. Lincoln! So simple, and so inscrutable!

Photographs numbered 3, 4 and 5, should be studied together. The number five shows an emergence into a higher atmosphere of trust and hope—an atmosphere which was not natural to Lincoln's temperament, but which he deliberately inhabited as for the saving of

Let's Put Our House in Order, Women Cry

One-piece Pattern May Replace Marriage-Divorce Crazy Quilt If General Federation Endorsement of Proposed Legislation Prevails

By CARL SCHURZ LOWDEN

THE women are aroused, and justly so. Possessing more power than ever before, they want to put our house, the government, in order. Just now they want to clean house by throwing out our crazy quilt of marriage-divorce laws to replace it with a new style of utter plainness. And every red-blooded man should say "Amen!"

The General Federation of Women's Clubs both preaches and practices its motto, "To promote all movements looking toward the betterment of life." It holds that the stability of our national family life is now menaced by the inadequacy, diversity and contradiction of our multitudinous statutes dealing with the formation and dissolution of the social contract.

"We endorse," it announced last June during its biennial session at Lake Chautauqua, New York, "the movement for a national uniform marriage and divorce law which shall prevent hasty and ill-considered marriages, preclude interstate confusion, and insure proper justice to all members of the family when divorce is necessary."

But the organization did more than just that, matching the words with action. Mrs. Edward Franklin White, the Federation's legislative chairman and deputy attorney-general of Indiana, prepared such a measure. It is being introduced into the state assemblies at the present time, and Senator Arthur Capper, of Kansas, will sponsor it later in Congress.

Would End Divorce Tangles

I HAVE the proposed act before me now. It has 37 sections, comprises 16 long pages of double-spaced typing and leaves not even the shadow of a doubt on the score of completeness. It slows the process of marriage, also that of divorce which cannot be granted without the interlocutory decree attached or sooner than 60 days. Mrs. White personally wished the measure more drastic, but wisdom dictated a certain degree of moderation.

"The only change that I favor," she told me, "is the waiting of six months before a divorce proceedings could be brought to trial after filing. A judge who had tried 3,000 divorce cases informed me the practical objection to this requirement was the inability to keep witnesses for that length of time, and it did not seem to me of sufficient importance to make any special fight for it."

She is, however, for all of the other requirements in the bill, both as to marriage and divorce; and she will contend for them if they are attacked or any serious amendments are proposed. As the act now stands it so nearly presents her own ideas that she would not consent to the making of any provision either more rigid or more lenient.

The current chaotic situation with regard to the matter of divorce will be clarified if the proposed measure becomes the law of the land. South Carolina will permit the filing of such cases, and no longer will it prohibit dissolution of the marriage tie. New York, which now recognizes one valid ground for divorce and that the least desirable to self-respecting citizens, will be more rational henceforth. The states that are now absurdly loose in giving decrees will find themselves brought sharply into line.

Five Causes Are Listed

THE five causes listed are adultery, abandonment or failure to provide, conviction of an infamous crime, incurable insanity and cruel and inhuman treatment. The last of these specifies that the offense may be "either mental or physical"; thus it embraces that refined and sarcastic kind of demeanor or studied indifference which some states have not recognized heretofore. Abandonment or failure to provide must have been extended over a period of one year or more. Childlessness and habitual drunkenness, now entertained as just causes in approximately five-sixths of our states, have been omitted from the proposed national measure.

"Upon the granting of a divorce," the thirty-third section stipulates, "an interlocutory decree shall be entered in favor of the plaintiff, which shall become final only after the lapse of a year, and entry thereof upon the record of the court by the judge of the said court. Until such decree shall become final, neither party may marry another."

There may be some opposition to this provision because of its inflexibility; yet if the length of the interval were left discretionary with the judge hearing the case, the law would probably be abused. The rights of the unborn must be protected. In some instances persons who have been separated for a number of years are parties to a suit; in such cases the need for the restriction seems less apparent. The interlocutory decree has the commendable feature, however, of operating as a stay or preventive of hasty remarriage inspired by infatuation; but it is doubtful whether the compulsion results in a net good or in making for immorality.

Under the act any marriage contracted within the year could be accomplished only through falsifying under oath, and the offender can "be punished by a fine of not less than $100 or more than $500, or by imprisonment in the county jail for not more than one year, or by both such fine and imprisonment." The marriage of a person in defiance of the injunction is now somewhat of an anomaly. Has he committed bigamy? Usually the judge dissolves the second marriage and attaches a fine for contempt of court.

The enforced delay of 60 days between the filing of the suit and the trial provides an interval during which the parties may think the situation over and possibly decide to adjust their disagreements. It largely removes the factor of impulsiveness, and thereby exerts an influence distinctly toward maintenance of our family life. The newspapers would be deprived of such juicy morsels as "the decree was granted within 24 hours after the suit had been filed," this particular bit being the aftermath of an action brought by an actress producer of motion pictures last June but only recently revealed.

Evasion of our present patchwork of laws can be accomplished now by moving from one state into some other. Thus we are treated daily to the spectacle of the law deliberately flouted; this contemptuous procedure elevates neither our ethics nor morals, nor does it make us better as American citizens. The new bill says that decrees shall be effective in every other state.

The marriage portion of the proposed national measure places the minimum ages of the applicants at 18 for the man and 16 for the woman; licenses may not be issued to parties that are younger. A man of 21 and a woman of 18 or more years may obtain a license on their own responsibility; if either of the parties is below these legal ages, he or she is a minor and must obtain the consent of the parents or guardian or curator.

First Cousins Can't Wed

"NO LICENSE to marry," reads section five, "shall be issued to one who is at the time married, or under the age limit, or an imbecile, pauper, epileptic, or afflicted with tuberculosis or a venereal disease, or where the applicants are members of different races."

First cousins and persons of nearer degrees of consanguinity or affinity are prohibited from marrying. Some states now permit this type of sure deterioration.

Application for a marriage license must have been made by one of the parties "at least two weeks before the license shall be issued." In cases involving extraordinary circumstances or constituting an emergency the judge of the court may suspend this rule.

"No license shall be issued," the bill sets forth, "unless both of the contracting parties shall personally appear before and be identified to the satisfaction of the proper marriage license clerk, who shall further require of the parties, either separately or together, a statement under oath relative to the legality of the contemplated marriage as required by section five, the date of the same, the names, relationship, if any, physical and mental condition, age, race, nationality, residence, and occupation of the parties, the names of the parents, guardians or curators of such as are under the age of legal majority, any prior marriage or marriages of the parties, or either of them, and the manner of the dissolution thereof; and if there be no legal objection thereto, such marriage license clerk shall issue a marriage license in the form herewith prescribed."

Enemy Could Interfere

IF YOU are expecting a wedding, you had better ring the bells now and avoid the revelations that this uniform measure exacts. It will be rather embarrassing to give the many facts asked, all of which are open to the public; it may be still more embarrassing to know that any one may register his objection to your intent and possibly thwart it entirely. An enemy could interfere in a disagreeable fashion, as the following paragraph clearly shows:

"Immediately upon receipt of an application for a license, the marriage license clerk shall enter the same on the public record and shall post in his office a notice giving the names and residences of the parties applying therefor, and the date of the application. Any person believing that the statements of the application are false or insufficient, or that the applicants or either of them are incompetent to marry, may file with the court having probate jurisdiction in the county in which the license is applied for, a petition under oath, setting forth the grounds of the objection to the marriage, and asking for a rule upon the parties making such application to show cause why the license should not be refused. Whereupon, said court, if satisfied that the grounds of objection are *prima facie* valid, shall issue a rule to show cause as aforesaid, returnable as the court may direct, but not more than 10 days from and after the date of said rule, which rule shall be served forthwith upon the applicants for such license, and upon the clerk before whom such application shall have been made, and shall operate as a stay upon the issuance of the license until further ordered. If, upon hearing, the objections be sustained, the court shall make an order refusing the license, the costs to rest in the discretion of the court; but if the objections be overruled, the party or parties filing the same shall be liable for all costs of the proceedings."

I said that this bill is explicit. The preceding section seems complete; there is probably no doubt as to its meaning, but the author does not take anything for granted, as it were. She continues with a further stipulation:

"The marriage license clerk shall provide a suitable book to be called the marriage license docket, and shall keep the same in his office among his records and enter therein immediately upon application a complete record of the applications for, and the issuing of all marriage licenses, and of all matters which he is required by this act to ascertain relative to the rights of any person to obtain a license. The said marriage license docket shall be open for inspection or examination by the public at any and all times during the office hours."

Residence Is Simplified

THE matter of residence is simplified. When the parties desiring to wed live within the state where the application is made, it shall be made to the clerk of the county "in which one of the parties resides." If nonresidents want to try the rôles of husband and wife, the application must be made to the "clerk of the county where the marriage ceremony is to be performed." Residents may wed anywhere within the state. The marriage must be solemnized within one year from the date of the license; for the latter is null and void after 365 days.

Two competent witnesses must be present at the solemnization and hear the declaration of the parties that they take each other as husband and wife. These witnesses are required in addition to the officiating person, who may be any one now authorized by the laws of the state to perform the ceremony, and regardless of customs, rules and regulations of any religious society, denomination or sect.

The bill combines severeness and strictness with lenity. For example, it requires the personal appearance of the parties before the marriage license clerk, but provides this alternative:

"Or, the parties intending marriage may, either separately or together, appear before any clerk of court, magistrate, or justice of the peace of the county wherein either of the contracting parties resides, or of the county where the marriage is to be performed, who shall require of them a statement under oath relative to the legality of the contemplated marriage as required by section five; and such statements having been duly subscribed and sworn to, and the parties having been duly identified, shall be forwarded to the proper marriage clerk, who, if satisfied after an examination thereof, that the same is in proper legal form, and that no legal objection to the contemplated marriage exists, shall issue a license therefor."

Clerk Subject to Fine

THE license clerk, however, may have a hard lot under the provisions of the bill. It is severe and strict unto him; he must step carefully or suffer the consequences. If he knowingly issues a license in violation of the act, he may be punished by a fine of $100 to $500, or by imprisonment in the county jail for not more than one year, or by both such fine and imprisonment. If he fails to record a license in the docket or to file the certificate returned to him by the officiating person or to keep the docket open for public inspection or prohibits any person making a copy of the entries, he may be fined $50; and if the poor fellow fails to return annually to the board of health of the state a statement of marriage licenses, the facts contained and the number of certificates received, he will be fined double the foregoing amount.

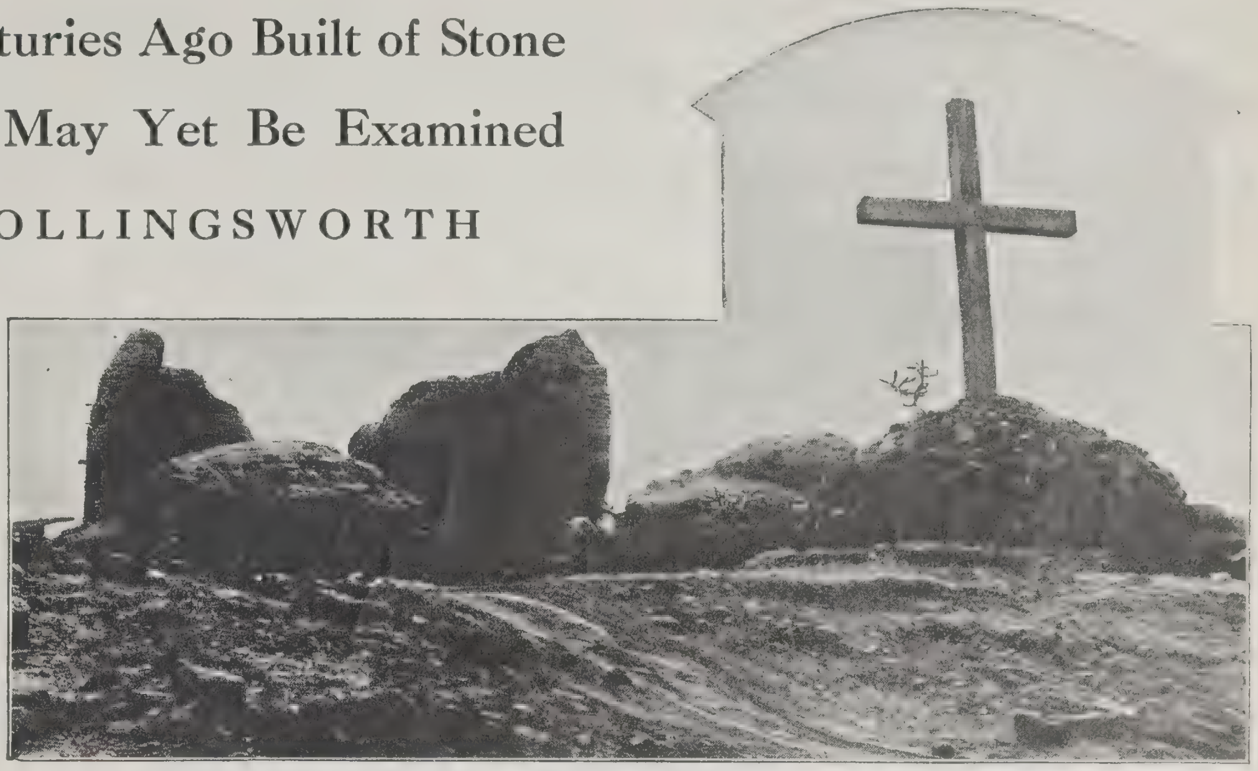
The Federation's measure has a full set of teeth. Any violator may be fined $500 and imprisoned a year, except in the case of minor offenses by the clerk.

I have quoted this bill at some length, inasmuch as a determined and sustained effort will be made to put it through Congress. If you dislike it, you should register your objections with your Representative and Senators; if you like it, urge them to vote for it. It is regarded by many as the best piece of marriage-divorce legislation ever proposed. The divorce evil, which really is a marriage evil, can be effectively dealt with, it is held, only when the nation makes the law of each state and the law of the land, in respect to these subjects, identical.

Explorers Find Pecos, Lost City of the Pueblos

Architects of Centuries Ago Built of Stone and Their Work May Yet Be Examined

By F. N. HOLLINGSWORTH



Explorations in the ancient city of Pecos, New Mexico. Ruins of the old Spanish mission, built three years before the Pilgrims set foot in America.

AN APARTMENT building that housed 10,000 persons and that was old when Columbus discovered America! Such was the Pueblo community of Pecos, now being explored and that has been unearthed by an expedition from Phillips-Andover Academy, headed by Professor A. W. Kidder, chief of the department of archeology at that institution.

Few persons who have traveled to California up the steep grade of Glorietta Pass in New Mexico have dreamed that almost within sight of the train are the ruins of what was once the largest city in America north of the Rio Grande, and surpassed in size only by the Aztec city of Mexico—a city that was old when Columbus discovered the fringes of the American continent. That city was Pecos, inhabited by the strongest group of Pueblo Indians in the whole Southwest, which meant, in Columbus' time, the largest number of human beings living in one place, for throughout North America, outside of Mexico, the people were mostly hunters and farmers, dwelling in small and widely scattered communities.

Pecos, now, however, is a ruin, and has been so for 100 years, lost to sight, and practically unknown. But before that it had a long and eventful history, part of which has been gleaned from the records of the old Spanish conquerors and colonists, and part of which has been reconstructed by the Andover expedition. To recover this lost history, to piece together the bits of evidence to be derived from the ruins, and to study the life and arts of this now extinct tribe, is one of the tasks to which these archeologists have set themselves.

The ruins lie on the Pecos River, not quite 30 miles from Santa Fe and directly on the route of the old Santa Fe trail. They cover the flat summit of a low, steep-sided ridge of limestone that runs like a thin tongue into the valley. This site was picked by the Pueblos because of its strategic value. It could easily be defended, and there was the whole fertile valley below for their farms and flocks, such as they had. It was concentrated in a locality well supplied with water. The chronicler of the Spanish expedition which came across the city found a four-storied town, with nearly 2,500 warriors, which would represent around 10,000 human beings. He described it as square, with a large court or yard in the middle, containing the estufas. One could walk all over the whole top of the town, without a street to hinder. The houses had no doors below, no more than any of the other smaller pueblos, but the terraces were reached by ladders.

For 200 years, or until about the time of the American Revolution, the Pecos people enjoyed great prosperity, and then were gradually decimated by the warlike Commanches, from the Great Plains. The foregoing covers only the last three centuries of the town's existence, however. For at least 1,000 years before that, and possibly longer, the mesa swarmed with people, working and building, adding to the curious civilization that was growing up among the Indians of the Southwest.

Their town was nothing more than a huge apartment house in which each family had its own little group of rooms. The rooms were small, averaging 6 by 10 feet. with hard packed clay floors and heavily beamed ceilings. The upper rooms were set back from those below; the apartments on the ground floor being cut off from all light and being used only for storage. Even the outer and upper rooms had no windows.

When the excavating of the expedition began, Pecos was nothing but a heap of tumbled ruins—building stones. In four years of work the picks and shovels of the gangs of workmen have made but little impression on the huge pile, but thousands of specimens have been recovered, and much has been learned of the daily lives of the people.

These old Pueblos were bold architects. They built solidly of stone and adobe; but they did not understand some of the vital principles of good masonry. Worst of all, they were not particular as to foundations, and often erected new sections on the unleveled ruins of the old ones. This happened again and again during the long life of the town; so that the archeologists often found the remains of as many as four distinct buildings, one below the other.

This sort of "Jerry construction," of course, sometimes led to catastrophes. Evidence of one was found last summer. A whole section of the pueblo wall had given way, crushing a series of nine or 10 living rooms in its fall. The owners evidently had enough warning to save themselves, for no skeletons were found, but there had been no time for salvage, and the entire contents of the rooms were recovered. There were cooking jars, water vessels, grinding and cooking slabs, stone implements, bone tools, and the complete paraphernalia of some old priest; some 30 buffalo horns, pierced at the tips to hold sacred plumes; 12 bone flutes, a wooden headdress, several carved and painted ceremonial wands, two large, elaborately sculptured pipes and a small jar full of shell ornaments.

Another room showed a double row of white human hand prints, big and little, slapped on the smooth surface of a beam. Evidently the Pueblos kept a family record of hand prints, for each size represented a different person, the print being made by daubing the hand with some kind of white paint.

While much is being learned from the rooms as they are being uncovered, more is being learned from the great heaps of rubbish that slope away from the ruins on all sides, the product of century after century of house cleaning, in some places extending to a depth of more than 20 feet. They are full of animal bones, broken implements and literally millions of fragments of broken pottery.

The study of this pottery has been the most important work at Pecos, for this Pueblo art never stood still. There was constant change of shape, color and decoration, and the growth and decline of styles can be read with a certainty that is possible nowhere else in the Southwest, for nowhere else had a town been occupied so long, nor any other rubbish heaps so perfectly and evenly stratified. At the very bottom are the oldest wares, made probably many centuries ago, decorated with purely geometric designs. Then came in glossy paints, striking in effect and hard to control in firing, and the patterns accordingly changed from the severe geometric to freer and more naturalistic styles. Crude human faces appear, as do conventional forms of birds.

They also buried their dead in the rubbish heaps, not from lack of reverence, but because the Pueblos liked to keep their dead near their homes, and the hard rock of the mesa presented too much of a problem in grave digging.

When a skeleton is found, it is carefully cleaned with trowel and brush, each bone being kept in its original position. Buried with one large skeleton, found in the usual position on his side, arms and legs drawn up tightly to the body, was found a large pottery dish, painted with a bold symbolic figure of birds and rain clouds. At his waist lay a tubular pipe, long and straight like a cigar holder.

Once the expedition uncovered a shallow pit heaped with the bones of a dozen men and women whose bodies must have been cut to pieces, for the bones were partly in natural order, partly scattered through the pile. Another mystery is the occasional grave found of a tall male of a different type from the lightly built Pecos. These have massive jaws and heavy brow ridges.

Often the work of scraping away in a pueblo room the accumulated dust and dirt is done with a heavy spoon, that no rare and valuable fragments may be further broken.

Careful notes and measurements are kept of every room opened, and frequent photographs are made. Careful data is kept of all the finds of implements, pottery, and so on, as to the strata in which they were found, and this is filed for reference when the shipments are unpacked and classified at the academy museum.

Explorations in the ancient city of Pecos, New Mexico. Excavating the ruins of the mission church, built by the Indians under the direction of the Spaniards.

How Bond Issues Have Dried Up Cincinnati's Wealth

Concluded from page 3

as of December 31, 1922, are $4,156,185.60. The administration of the city government costs approximately $8,000 000 a year. So that the interest charge against the city is more than half as much as the city government costs. For each man, woman and child of the city $10 a year must be paid for interest on bonds and $20 each, per year, for the city government. This makes a total per capita city tax of about $30 yearly.

Cincinnati has a dual municipal government in that the board of education is independent of and distinct from the mayor and other city hall officials. The reason for doing this, some years ago, was to get the schools out of the curse of "City Hall" politics. The funds for the support of the schools are raised and managed entirely by the board of education. The present debt of the city (1922), as named above, includes the $8,526,000 bonded indebtedness of the board of education. In 1921 the board of education was obliged to issue $900,000 of certificates of indebtedness *at five and one-half per cent interest* for money with which to pay the $500 per year increase of salary for each of 1,800 teachers. The teachers organized and threatened to strike unless their salaries were increased to conform to the higher cost of living.

Hamilton County, of which Cincinnati is the county seat, has a population outside of Cincinnati of 92,431 or less than one-fifth of the county's inhabitants. In addition to the city debt the county has $7,000,000 of bonds outstanding. These run from 10 to 50 years and draw interest of from four to five per cent. This brings the total debt of city and county up to $110,113,149.62.

In 1913-14 county bonds were authorized to the extent of $2 950,000 for money with which to build a new court house. The magnificent building was completed in 1919. After the contractors' bids were accepted and they had given bonds for the faithful performance of their contracts, the war began and the prices of material and labor went soaring to unheard-of prices. The politicians and the officials saw to it that the contractors made an iron-clad agreement to employ only union labor, which it was next to impossible to get in 1917-18. Practically every contractor and sub-contractor on the county building went broke. There were 143 strikes during the construction of the building. If the contracts had been made in 1917 and 1918 instead of four years before, the magnificent building could not have been built for less than $6 000.000 instead of slightly less than $3,000 000 which it cost. This is one instance, at least, where the contractors of a public building had no charges for graft made against them. The court house bonds carry an interest charge of $145.000 a year. The term of the bonds is 30 years. *The total interest will amount to $4,350,000, which will make the $3,000,000 court house cost $7,350,000.*

Such is the method by which the borrowing and bonding system loads cities with debts that destroy them.

Among the purchasers and holders of the city, county and board of education bonds in Cincinnati are such brokers' and bankers' names as: A. Netter & Company, Rudolph Kleybolte & Company, Albert Kleybolte & Company, Seasongood, Mayer & Company, Weil, Roth & Company, J. C. Mayer & Company, Field, Richards & Company, A. B. Leach & Company, and a number of Cincinnati banks, as well as several New York banks.

The "Smith Law" enacted by the state legislature in 1911 was a deliberate attempt to stop the mad bonding practice prevalent among Ohio cities. Under this "Smith Law" the tax levy cannot go beyond one per cent, or 10 mills.

The "City Hall" politicians are naturally very severe in their criticism of the "Smith Law." They take a shot of words at the venerable Judson Harmon, who as governor signed the "Smith Bill." I spoke to former Governor Harmon about the matter. He is now practicing law in Cincinnati and understands the serious financial condition of the city, as a municipality, and the stupid debt-making that has been practiced for generations.

Governor Harmon said: "When I signed the 'Smith Bill' as governor in 1911, I felt sure it was a good and a much-needed law to check the reckless extravagance and mismanagement, and worse, in the cities of the state. And I would sign it again if I were in the same position."

Always resourceful, the "City Hall" politicians began issuing "Deficiency Bonds" which they sold for cash to make up what money they thought they needed in plenty. There are millions of these bonds outstanding. They pay a fine rate of interest to the speculators in Cincinnati's distress, but they don't permanently help Cincinnati. As long as the "City Hall" crowd had the power to issue "Deficiency Bonds" they did not worry much about the restrictions of the famous "Smith Law."

But on one fine day there drifted into Columbus one of those confounded "country boys" who had broken into the state legislature out in his home county. His name is Griswold. He framed a bill which was enacted into law. *It prohibited the cities of the state from issuing "Deficiency Bonds."* This is called the "Griswold Law" and any reference to it by a "City Hall" politician leaves a very bad taste in his mouth, judging from the way he squirms. This law went into effect early in 1922. It completely blocked the game of the "City Hall" crowd of Cincinnati. *They could not issue any more of the city's obligations and pile millions more each year on top of the already one hundred million debt.* Their job was to run the city within its income, and this they have failed to do. It would be an easy matter, even today, to sell the city's bonds, general, "Deficiency" or assessment bonds to such brokers and bankers as Kleybolte, Mayer, Roth, Weil and others, and thus get money with which to carry the city's establishments, pay the interest and to redeem the maturing bonds that are constantly being presented for payment. But the "country boys" of the legislature at Columbus said an emphatic "No! you stop right here, you'll get along on your tax allowance or you'll blow up!"

That, in effect, is what the state legislature told the lobbyists of the "City Hall" crowd who were at the legislative sessions to defeat the "Smith Bill" and the "Griswold Bill" and to "save Cincinnati." It looks as if the one way to "save Cincinnati" is to save her the $4,156,185 in interest which she is compelled to pay every year. City managers, like any other manager, are up against the job of learning how to make the business support itself.

Aerial photograph, U. S. Army Air Service, Engineering Division, Dayton, Ohio.
Cincinnati from the air.

In addition to general bonds and "Deficiency Bonds," Cincinnati sold large issues of assessment bonds, which is a custom in many boss-directed cities. This is actually farming out the taxpayers of given streets and districts, mortgaging their tax-payments ahead of time.

The home owners were already burdened with the general taxes, and in many cases were unable to pay the assessments against their property in a lump sum. So the "City Hall" politicians were "kind" to them by splitting the assessments up into 10 equal annual payments, which were sold for the much-needed cash by *a much higher rate* if the property holders defaulted in any annual payment.

Assessment bonds were issued against these assessments, which were sold for the much-needed cash by the "City Hall." Of course, all this was done "according to law." At times these bonds were sold at par, but it was rarely that they brought a premium. More often there was a slight discount. Thus the people of Cincinnati have had additional burdens placed upon them.

To sum up, Cincinnati is almost out of ready cash and the city cannot borrow any more, unless the state legislature changes existing laws, which would only mean permission for the city to go still more deeply into debt. This, however, seems doubtful.

"Meanwhile, what is Cincinnati going to do?" That is the question the people of the "Queen City" are asking but they have found no one who is able to answer it.

When the prohibition law went into effect three years ago Cincinnati lost more than $1,000,000 a year in saloon licenses. The city officials sought some scheme of taxation that would make up the loss, in part, at least. They began by charging merchants and shop keepers an "Occupation" tax. Last year they raised $502 237.17 in this way. The new "franchise" tax yielded $379,386.63. While this placed quite a burden on the business men and created considerable dissatisfaction, it helped swell the city's revenue quite a little. But it wasn't sufficient to cover the mounting expenses.

In the late sixties, Cincinnati became ambitious to become the great "gateway" to the South. The city felt the need of a railway. An agitation was started. The question of a bond issue for building a railway across the states of Kentucky and Tennessee was voted upon. The bonds carried. Cincinnati began to build the Cincinnati Southern Railway with the proceeds of a bond issue a little short of $20,000,000. This is now a part of the city's outstanding bonds. The original bonds were issued 50 years ago. The interest on $20,000,000 worth of bonds has amounted to nearly $40,000,000. While the road had many vicissitudes, it has turned out to be a very profitable enterprise. It is leased to Southern Pacific interests and after all fixed charges, including interest on bonds, are paid, the city realizes several hundred thousand dollars a year, net income, at present, from the road. The railway is 338 miles long. Cincinnati has the distinction of being the only city in the world that owns a long-distance steam railway. The people of Cincinnati voted this railroad into existence. It is a great asset to the city and if it could be sold, would, in a large measure, pay off the great bonded debt hanging over the city. But it is under lease till 1965 and cannot be sold. But the Cincinnati Southern Railway is another story and a romantic one. There is no doubt but that there are other cities besides Cincinnati that are facing financial disaster. Millions of tax money in nearly all cities is being paid out in interest on municipal bonds to enrich the money-lenders. The debts of all cities are increasing with dangerous rapidity. Cincinnati, however, is the first city to give emphasis to its own financial plight, in public meetings on the part of the chamber of commerce and other civic bodies. But the situation in the "Queen City" is so serious that none of these organizations of public-spirited men were able to devise a means of getting the city out of the financial crisis that has overtaken it.

Concluded from page 7

thousand experiments in the breeding and development of flowering plants. The Shasta daisy, developed from the wild daisy of the slopes of the California mountain, leaped into instant favor; from the small evening primrose of the valleys of the Sierra Nevada, he developed an evening primrose with blossoms five inches and more in diameter, with a fragrance far surpassing that of the wild flower He took the common verbena, doubled its blossoms in size, and gave it a fragrance unsurpassed in the garden. He crossed the oriental poppy with the peony, and produced a perennial ever-blooming poppy of huge size. He created a *blue* petunia. He developed the California poppy—which is not a true poppy—into shades of white, pink, crimson, flame and various yellows. He developed a zinnia which looks like a dahlia and the dahlia he made better and larger.

Fruits have always been dear to the heart of the plant magician. He has developed a series of Burbank plums from which more than 100 carloads of fruit were shipped out of a limited area in California last year, just a beginning of a tremendous industry. These plums have been responsible for the establishment and growth of at least one town in this state, and, in some of their various forms, are adaptable to virtually all the soils and climates of the United States. He saw that cherries could be made far more productive than they were, and he set out to fill the need. The result is an early-bearing cherry, with clusters of fruit from three to 10 times as large as the clusters of the ordinary cherry, and with large, sweet individual fruits. The prunes created and developed by the famous Santa Rosan have been planted throughout the prune-growing regions of California, until now they are grown almost to the exclusion of all other varieties.

There remained, however, the uninvaded field of the nut-bearing trees, and the energetic plant breeder entered this. There he produced a chestnut tree which begins to bear at six months, and is in full bearing at two years from the seedling, as compared with the 10 or 15 years necessary to bring the ordinary chestnut into bearing. The combination of the wild black walnuts with the Persian walnut, to produce a tree of quick growth, yet furnishing timber as fine-grained and valuable as that of the American black walnut, has been mentioned, and the domestic walnut, the almond and other nuts also have been improved.

But, in spite of all these discoveries, creations, developments, improvements, or whatever one wishes to call them, Mr Burbank is still unsatisfied. At 74, when most men would be retired, and possessed of enough reward for his half-century of work as a plant breeder to retire in more than comfort, Luther Burbank is plunging into new fields of plant improvement. To him, life is endless progress, and his would be impossible were he to endeavor to halt the advancement of the work which has become an integral part of his daily life. That is one of the many reasons that California is so proud of him, and one of the causes of the spontaneous tribute which is to be paid to him on his Golden Jubilee of plant work, this spring.

A Photographic Study of Moods of Lincoln

Concluded from page 11

his life. Most prone to doubt, Lincoln of all men was most ready to prove the medicinal and enlightening value of faith.

His expression in many photographs clearly indicates a humorous mood. Many reports about him affirm his ever-present wit. It is told that when he was stumping Illinois as a candidate for the legislature, and often while spending a night at some wayside tavern, he would frequently swap stories with those sitting around the big wood stove till late in the evening. On many occasions, he kept the assembled company convulsed with laughter till after midnight with his humorous tales, and such was his style that it was impossible to tell how many he had ever heard before, and which ones he concocted as he went along! Such an unquenchable humor served him well, late in his life, when the affairs of State bore upon him unmercifully.

The noble tenderness and sympathy which Lincoln felt for all children, he lavished without restraint upon his own. Willie and Tad were privileged beings at the White House, and their boyish pranks and companionship did much to relieve the great strain under which the President lived. The familiar photographs of Mr. Lincoln and Tad suggest an expression of the genial nature for which Mr. Lincoln was noted. His happy smiling countenance, shown in one photograph with Tad, and the dignified attitude of the teacher, as displayed in the other, while looking through a book in the studio, confirm the stories frequently told of Lincoln's fondness for his children.

These photographs portray well the paternal air of gentleness exhibited upon many occasions, and the affectionate attitude of companion and confidant to his boys; he delighted in their company.

This happy spirit of Lincoln's always expressed itself when he was with children. Tarbell's "Life of Lincoln" quotes Mr. Frank P. Blair, of Chicago, saying: "During the war my grandfather, Francis P. Blair, Sr., lived at Silver Springs, north of Washington, seven miles from the White House. It was a magnificent place of four or five hundred acres, with an extensive lawn in the rear of the house. The grandchildren gathered there frequently. There were eight or ten of us, our ages ranging from eight to twelve years. Although I was but seven or eight years of age, Mr. Lincoln's visits were of such importance to us boys as to leave a clear impression on my memory. He drove out to the place quite frequently. We boys, for hours at a time, played 'town ball' on the vast lawn and Mr. Lincoln would join ardently in the sport. I remember vividly how he ran with the children; how long were his strides, and how far his coat tails stuck out behind, and how we tried to hit him with the ball, as he ran the bases. He entered into the spirit of the play as completely as any of us, and we invariably hailed his coming with delight."

Paid Heavily in Vitality

WHILE Tad and Willie were sick, at the White House, Mr. Lincoln sat at their bedsides during the whole of several nights, and when William finally died (February 20, 1862) the President was immeasurably depressed. Though no photographs now existing were taken at that time, still, we may gather from the saddest of his expressions how great was his capacity for the sentiment of woe.

The habit of study that Lincoln acquired in youth remained with him through his whole life, and a meditative disposition is reflected in several of his photographs, principally those in positions 8, 10 and 12.

In the late 1840's, when Lincoln was practicing law, he devoted much time to his attempt to acquire a general education. He studied mathematics, astronomy and poetry very regularly. Mr. Herndon, Lincoln's law partner for many years in Springfield, tells of his industry in this respect, saying:

"Placing a candle on a chair at the head of the bed, he would study for hours. I have known him to study in this position until two o'clock in the morning. Meanwhile, I and others who chanced to occupy the same room would be safely and soundly asleep."

Indeed, in the winter of 1849-1850, he even joined a club of a dozen Springfield gentlemen who had begun the study of German. The meetings of this class were held in his office.

It was always a noteworthy characteristic of Mr. Lincoln's, that he assumed a respectable demeanor while any one was addressing him. This attentive, quizzical look is quite evident in Photo No. 11, taken late in 1863. One eyebrow slightly arched, the penetrating eyes gazing forth beneath, and the whole atmosphere of attentive inquiry all indicate the concentration of effort he directed toward any matter requiring his consideration.

A survey of Lincoln's photographs in chronological order must impress one with the tragic cost in vitality that he paid for doing what he believed to be his whole duty. As mute testimony of the terrible mental strains under which he worked, lines of worry gradually traced themselves upon his features which became more and more careworn as the Civil War progressed.

A worried look, shown to the right of the lower "Tad" photo, was sometimes replaced by a smile, as it became increasingly evident that the war was being brought to a successful conclusion and the President's anxiety was relieved. Hopeful reports from all armies in the field had a wonderful effect of reviving the President's troubled spirits. Lee surrendered April 9, 1865, the day on which the last photograph in this series was taken, and the President's smile portrays his buoyant spirit.

Abrams Fails in Boston

Concluded from page 9

His constant experiments had told him the exact location of every disease. He could even tell whether the blood was real or whether it came from a human being. It was all very simple.

Meanwhile, the "Oscilloclast" sat there idle, useless, apparently forgotten, or else reserved for the use of its discoverer alone. It was getting near 10 o'clock and Dr. Abrams hadn't spoken yet. *Finally, Alexander Marky, managing editor of Pearson's Magazine—this being the magazine that published "The House of Wonder," by Upton Sinclair, the well-known propagandist, there being free reprints of this in every seat with a reserve supply available*—introduced the "miracle man."

But before Dr. Abrams stepped briskly to the platform, there was announcement that brought disappointment. This was to the effect that the "Oscilloclast" would not be set in motion, that no germs would be shaken to death and that no diagnosis would be made. Dr. Abrams, said the speaker, judged auditoriums by San Francisco standards. He didn't know that Carnegie Hall was so large. If experiments were to be made, *they could be seen only by those in front* and that would not be satisfactory, *hence there would be none.*

The "Oscilloclast"—if that was it—only a useless "prop!" Amazement was expressed. Into the minds of some came *the image of the painted Indian that sat on the front seat of the automobile of the traveling medicine man!*

Dr. Abrams smiled. He stated that syphilis was the primary cause of human illness; that almost all disease could be traced back to this origin; that the disease was inherited or contracted innocently by thousands; that it existed in animals and was transmitted to human beings. Then he paid his respects to the medical profession as a body but not as individuals. It will be remembered that when the American Medical Society and other organizations criticized his methods, Dr. Abrams promptly resigned.

Continuing, he touched briefly and sketchily on his methods, avoiding all detail; once or twice he looked toward that thing on the table and walked toward it, only to halt and again face his audience; and he concluded by a few more generalities. Led by his cohorts on the stage, the audience applauded briefly and then looked one at the other.

3,000 Go Away—Disappointed

THE 3 000 were frankly, and the majority outspokenly, disappointed. They had paid admissions, they had waited a whole evening and the whereabouts of Tom Lawson had not been divulged; not a single drop of blood had been analyzed and there had been no clinic. That which Dr. Abrams had given them was less by far than he had proclaimed in the daily press. He had afforded no opportunity to pass judgment on his claims.

In short, this Carnegie Hall meeting was remarkable for its omissions. The preliminary announcement had said that Dr. Abrams had come East to raise money for clinics so that the benefits of ERA could be spread still further. The announcements had said further that Dr. Abrams was eager to give his services to these that humanity might be benefited, that he was willing to devote his time, his energy and even donate apparatus. But in his brief and rambling dissertation, Dr. Albert Abrams did not touch on these clinics at all, though his audience had complimented him by coming out on a cold, rainy night and paying an admission to hear him.

There must have been several thousand dollars taken in as a result of that meeting but if there ever has been an accounting, it has either never been published in any New York daily paper or it has escaped the attention of the writer.

But though the doctor had been cryptic, there were those who still had faith. Many of them donned their wraps and hurried back stage, hoping to have a few words with this eminent scientist. They crowded about him and stopped him as he was leaving. Dr. Abrams was in a hurry and did not hesitate to so express himself. Foremost among the throng was the man with the bandage on his face. He was so in earnest that he managed to push himself far enough forward to reach the object of his quest.

"I have a cancer, doctor," he said. His clothing was worn but clean and neat and his broken shoes polished. "I would like—"

The doctor flashed his eyes on him and then turned toward a well-dressed, elderly woman who was wringing his hand and telling him how wonderful he was.

"Doctor," interrupted the man with the bandage. "I———"

"I don't want to talk to you," snarled this most eminent scientist, drawing back. "I want to get out of here."

Adherents broke a way for him and he disappeared.

The writer attended the Carnegie Hall meeting and heard all that was said; he was back stage when Dr. Abrams eluded those who would detain him. Also he was present at two interviews given newspaper men. At this point it having been stated earlier in this article that there would be more attention given the interviews, it may be well to scan some of the doctor's statements made before the Carnegie Hall meeting because they are an aid in forming judgment, inasmuch as in them Dr. Abrams was far more voluble than he was on the platform. It was significant also that when on the platform Dr. Abrams did not deny a single statement which had been attributed to him in New York.

The subject of love seems to interest Dr. Abrams greatly despite his 60 or more years. There are different varieties of love, he holds. That is, the vibrations of the love of a man for a woman are not the same as those of the love of a mother for her child or those of the child for its parent. Nor is that all. Late dispatches from San Francisco say that Dr. Abrams holds that he can diagnose love by radio through his electronic reactions and that love can be broadcast like music, market reports, the weather or the offer of a reward for bank robbers who are at large!

An important discovery antedated the electronic vibrations of Dr. Abrams. The announcement was made in a dispatch from Chicago in October, 1913. This stated that long experiments by Dr. Abrams showed that red was the color that imparted the greatest energy. In that color, the electrons may have made their preliminary appearance to the discoverer.

After his Carnegie Hall lecture, Dr. Abrams remained in New York several days seeking funds for those clinics but whether he was successful, is not on record. Certainly he became less available for interviews. From New York, he went to Boston and, according to reports from that city, he was more explicit than he was in the metropolis and gave some demonstrations of his powers.

Among these, according to the *Journal* of the American Medical Association, was the diagnosis of a perfectly healthy man as suffering from a complication of diseases!

It may be said also that while Dr. Abrams has openly regretted that the **Rockefeller Institute had refused to investigate his claims, he sidestepped an investigation by the Massachusetts Medical Board just as he has sidestepped similar investigations in California.**

The statement as to the Rockefeller Institute was submitted to members of that body by the writer. There was an absolute refusal to discuss either Abrams or his methods.

To those who attended the Carnegie Hall meeting, the statements of the *Journal* of the American Medical Society are highly interesting and edifying. The *Journal's* report says:

"A few weeks ago the editor of the *Boston Medical and Surgical Journal* pointed out the fallacies of Albert Abram's claims and the absurdities of his cult. Then Abrams came to Boston and was given an opportunity to lay his cards on the table face up. The *Boston Medical and Surgical Journal* reports editorially in its issue of October 19 the results of Abrams' visit. On Monday, October 9, Abrams appeared before the board of registration in medicine in an informal hearing. The opportunity had been given a representative of the electronic 'cult' to inspect the room and arrange for proper wiring so that Abrams could give a demonstration of his method.

"When the meeting came to order, however, Abrams said that it was impossible for him to give a demonstration at that time. His followers then started to hold an 'experience meeting,' detailing the marvels they had wrought. Naturally, the chairman of the board of registration in medicine refused to permit the meeting to be turned into an advertising stunt, and the meeting was adjourned.

The Troubles of a Well Man

"THE day following Abrams gave a clinical demonstration of his method in the laboratory of one of his disciples. Our Boston contemporary points out that, by a remarkable coincidence, while Abrams' followers in the rear of the room were able to see and hear the reactions claimed by Abrams, those members of the Massachusetts Medical Society who occupied chairs close to the demonstration could neither see nor hear them. Abrams, it is said, refused to submit the method to any test offered, but confined himself to demonstrating the presence of lesions the existence of most of which could be proved only by post-mortem examination.

"A member of the staff of the *Boston Medical and Surgical Journal,* a man in perfect health, was selected for experiment. By his diagnostic methods Abrams discovered in this healthy individual a streptococcus infection, tuberculosis of the intestinal tract, congenital syphilis and intestinal sarcoma—otherwise the man was all right! It is understood that the volunteer inconsiderately refused to submit to a post-mortem examination.

"The *Boston Medical and Surgical Journal* declares that Abrams' visit to Boston disclosed two outstanding facts: First, **the man persistently refused to submit his methods to tests that could be scientifically controlled or to give a demonstration under conditions that would be subject to the usual rules of scientific criticism;** second, in the one case in which he did demonstrate his method he found syphilis, tuberculosis, sarcoma and streptococcus infection in a healthy individual.

"As the *Journal* points out, if Abrams can diagnose disease where no symptoms exist he certainly should have been willing to submit to a test based on the diagnosis of blood specimens from patients with definite ailments. The fact that Abrams refused to perform such tests speaks more eloquently than any critic. **Abrams, it is said, claims that his electronic reactions are either the greatest miracle of the age or the greatest fake. Here we have a point of agreement with Abrams—and the electronic reactions are no miracle."**

But despite this and despite the Carnegie Hall meeting, there are those in New York who still have faith in Dr. Abrams and the ERA. Investigation shows that there are at least six of his followers who are practicing his methods here. These, according to reports, are fast becoming rich through treating thousands of persons. They either make their own diagnosis from a drop of the patient's blood or send it on to Dr. Abrams.

Several leading physicians of New York were questioned in regard to Dr. Abrams but they, like the Rockefeller Institute, declined to comment.

"It would be no use," said a physician regarded as one of the most able diagnosticians in New York. "He is already claiming persecution. If we were actively to campaign against him, it would simply boom business. There are enough persons being deluded now."

After attending the Carnegie Hall meeting and giving Dr. Abrams' claims considerable study and especially after talking with the man himself, the conviction persists that were his premises valid he would be given some recognition at least. Pioneers meet with difficulties but they are seldom insurmountable.

BRIEFLY TOLD

There were only 18,853,000 horses on the farms of the United States January 1, 1923. This total was smaller by 203,000 than on the first of January, 1922.

Three hundred thousand troops, prisoners of war and all the criminals in China labored 15 years to build the Great Wall of China. It is 2,000 miles in length, and was built to keep back the Tatar hordes, which for 2,000 years devastated Asia and even Europe from time to time.

Many of the doors in the houses of Havana's middle class are built of solid mahogany and other expensive native woods.

Electric searchlights playing over the surface of the waters in the Norwegian fiords lure the sardines to the surface where they can be caught. The sardine canneries along the coast of Norway were recently threatened with a lack of fish owing to the fact that the sardines remained so deep as to render fishing impossible. The lights remedied this situation.

Bullfrogs from America have been sent to Japan for distribution throughout the island kingdom for propagation. It is believed they will thrive in the drainage and irrigation ditches and paddy fields throughout Japan. The frogs are expected to destroy many injurious insects in the paddy fields and truck gardens.

A descendant of Christopher Columbus was recently admitted to the bar in England.

The Belgian Congo will be able to furnish radium in such quantities as to supply the needs of the world, according to the Belgian minister of the colonies.

Only half the number of babies today die after the first month, compared with infant mortality 15 or 20 years ago. During the first month four per cent of all infants die, just as they did in years past. Life insurance statistics show that it is easier to survive a year at the age of 65 than for a new-born infant to reach the age of one month.

A new hemp harvester has put new life into the hemp industry in America. It competes with cheap foreign labor which formerly was putting our hemp raisers out of business.

Bamboo quail from the northern provinces of China are to be distributed in the state of Washington in the spring. The bamboo quail is said to be a bird of a size between native quail and Hungarian pheasants. These birds come from a cold section of China, where the winters are more severe than in Washington.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The *Faraday*, an old cable-laying ship, is to be broken up. It now lies at anchor in the Thames off Southend, England. She was launched in 1874 and in her lifetime has laid eight transatlantic cables. An up-to-date vessel now building on the Tyne will take its place. The new boat is a 7,000-ton vessel, with all the modern scientific devices and a cable-carrying capacity of 5,000 tons.

Eight new American firms have recently opened offices in Shanghai.

Divers are recovering $150,000 worth of copper lost by the government in 1919 when a tug on which it was loaded was crushed in collision with the steamship *Buford*, between Governor's Island and Ellis Island, New York Harbor. The copper was found recently through a new electrical sounding device after the government had searched for it for two years. It lies in 90 feet of water.

Skimmed milk is being condensed and stored in sacks for indefinite storage as stock feed. When a 5 to 1 condensation is secured the skim milk is mixed with absorbent grains. After the grains have absorbed the milk they are dried and sacked.

A stone monument stands in Madison County, Iowa, dedicated to the first of the "Delicious" apple trees.

"Hooch" is short for hoochenoo, a brew first made in Alaska. In 1869, when American troops were stationed in Alaska, they were forbidden to have any spiritous liquors. The soldiers took to making their own and concocted liquor noted for its power and vileness. The natives called it hoochenoo and soon learned to make it. It is said that one quart was sufficient to craze the brains of 10 Indians.

Starving elk are breaking down the fences built about the haystacks of a rancher near the South Dakota boundary line in Wyoming. The state refuses to reimburse him for his hay losses and it is against the law to kill elk, so he is confronted with a serious problem. If he loses his hay supply his stock will suffer and it is necessary constantly to stand guard over his stacks.

Ancient cities of the Mayas in Yucatan, Mexico, are being investigated by four American archeologists. It is believed that discoveries rivaling the recent finds in the Valley of Kings, at Luxor, Egypt, will be made here. Special attention will be given two cities recently discovered in the jungle wilderness, Chichen-Itza and U-Xmal and efforts will be made to translate hieroglyphics unearthed from the ruins of the Maya race which vanished more than a thousand years ago.

For the first time in history women in Germany have sat on a trial jury. The cases were two civil court cases in Berlin, comprising two libel actions.

The original message of President Monroe, embodying the Monroe Doctrine, was found, together with many other valuable documents, in a basement room under the Capitol terrace. The valuable papers were packed away in a wooden file, partly rotted and covered with cobwebs. The original draft of the bill establishing the judiciary of the United States, a paper-backed volume in the handwriting of Samuel E. Otis, secretary of the first Senate, containing the only record of the enrolled bills presented in the first session of Congress, and a bill providing for the admission of Kentucky into the Union were also found. Officials admit there are many other priceless documents decaying away in storage rooms, all legible but so brittle that pages break in handling.

Swiss soap manufacturers are wrapping their product in Austrian ten-kronen paper bills. This is cheaper than printing special wrappers and it acts as a premium on which the holder may sometime be able to cash in.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

Philadelphia Fair Fades in Riot of Land Speculation

CHRONICLER OF THE NEGLECTED TRUTH

Philadelphia, Victim of Land Speculators, Sees Independence Fair Plans Fade Away

Wanamaker's Original Program for Sesquicentennial Lost in Wild Scramble of Real Estate Agents to Profit by Proposal of Exposition in 1926

This is the first of two articles detailing the mishaps that have occurred to prevent the carrying out of the Philadelphia Sesquicentennial plans as originally outlined. The second will appear in an early issue.

A DREAM of profits at the expense of the people that might have made Croesus turn over in his grave with envy is being dissipated in Philadelphia. Originally it called for a direct expenditure of about $40,000,000 and indirectly for $100,000,000 more of public funds for the creation of a World's Fair—the Sesquicentennial Exposition of American Independence. As it exists in its present shrunken form the dream could be fulfilled for $15,000,000; at least that amount would enable real estate speculators to "get out from under." Even that sum, however, is apparently to be denied them. The Sesquicentennial as conceived by the late John Wanamaker is dead.

All that will be hotly denied by the clique of Jewish speculators responsible, in the last analysis, for the failure of the exposition scheme. The inability of the Hebrew to admit that he has overreached himself is the fatal weakness of the race even in its own chosen fields of barter and finance. The facts speak for themselves. Denial cannot change them. If some Americans are annoyed by the knowledge that a greedy group has made it economically impossible to put through an idea that was patriotic in its inception, they may take comfort in the fact that the law of compensation already has begun to operate. It is difficult to see how the speculators can avert losses variously estimated at from five to ten millions of dollars. Besides, the people save what they might have lost in higher taxes, exorbitant rentals and inflated prices for real estate.

John Wanamaker is generally credited with the first public suggestion that the one hundred and fiftieth anniversary of American Independence be celebrated in Philadelphia in 1926. The idea, however, had been in the minds and hearts of many Americans. Mr. Wanamaker was one of the members of the Centennial Committee responsible for the Exposition of 1876. He suggested more than a half-dozen years ago that work be started on the plans for 1926, but the war interfered and it was not until after the Armistice had been signed that the plans began to take shape. There was at that time no open opposition. It was apparent to the most casual observer, to be sure, that while all leading citizens spoke in favor of the idea there was an uneasy air of hanging back. No one at that time suggested what is now common knowledge, but unquestionably many men suspected it.

Private Corporation Formed

URGED by Mr. Wanamaker, Mayor J. Hampton Moore finally took the lead. Various meetings were held and there was the usual endless discussion. After considerable delay, 30 citizens fairly representative of the social, cultural, financial, industrial and civic life of Philadelphia organized a private corporation, not for profit, and obtained a charter from the state under the name of the Sesquicentennial Exhibition Association. Nothing better illustrates the suspicion in which the whole project was held than the fact that a private corporation was found necessary to launch a project which in its very nature was a public enterprise. In its application for a charter the association said:

"Said corporation is formed for the purpose of educating the public by exhibiting artistic, mechanical, agricultural and horticultural products, and providing public instruction in the arts and sciences, thereby celebrating the One Hundred and Fiftieth Anniversary of the signing of the Declaration of Independence by holding in the City of Philadelphia, in the State of Pennsylvania, an exhibition of the progress of the United States in art, science and industry, in trade and commerce, and in the development of the products of the air, the soil, the mine, the forest and the seas; to which exhibition the people of all other nations shall be invited to contribute evidences of their own progress to the end that better international understanding and more intimate commercial relationships may hasten the coming of universal peace."

The charter based on that broad plan was issued May 9, 1921. The mayor became the first president of the association. Provisions were made in the by-laws for the appointment of 22 committees covering nearly everything under the sun. Disputes and misunderstandings arose at once, the reasons being not then apparent. For nearly a year the chief output of the association seemed to be delay. Politics doubtless played some part, as usual in anything that Philadelphia undertakes. It became noised about that the mayor wanted to be the director of the exposition. Others were determined that he should not be. Meetings were held from time to time, but they were more or less spiritless affairs. In June of 1921 Congressman George P. Darrow introduced a resolution in the House at Washington for national approval of the affair. He sought also to get an appropriation, but failed.

Finally it was agreed that nothing could be done until a site had been selected. The executive committee accordingly called on the Philadelphia chapter of the American Institute of Architects, the Philadelphia Real Estate Board and the Engineers' Club, of Philadelphia, for recommendations. A detailed survey was made of some 14 suggested sites, the experts agreeing finally on a location utilizing the Parkway and sections of Fairmount Park and calling for the condemnation of land on both banks of the Schuylkill River. The recommendation fitted well with plans for public structures already launched, and also gained approval by reason of the fact that it provided for the elimination of ash dumps and other eyesores on the banks of the river, and the general beautification of that area.

Up to that time there had been some holding back, but little or no criticism. At times there had been spurts of enthusiasm, as when city council pledged the honor of the city to the support of the exposition up to five million dollars. Some of the councilmen wanted to pledge an unlimited sum. Fortunately even the pledge made is not considered legally binding. It was not an ordinance and carried no appropriation. As matters stand now it is unlikely, to judge from the temper of the councilmen as indicated by their remarks, that any money will be provided by the city in addition to the $50,000 already set aside and spent for preliminary expenses.

The selection of the site was the signal for the speculators. Forthwith a small army of canvassers was put to work trying to tie up properties of any kind that might be expected to be influenced in value by the exposition. Their activities were concentrated on a rough triangle formed by Broad street—a north and south line—the Parkway and the river, running irregularly northwest, and a point about 30 blocks north of city hall, which would form the apex of the triangle. Everybody knows what real estate speculators were able to do during the war, and it is unnecessary to go into that in detail. Philadelphia was no exception. The area described contains all sorts of buildings—workmen's dwellings, medium and high-priced homes, stores and some factories. Homes of workers that sold for two or three thousand dollars before the war had been put up to four and five thousand dollars by the activities of the speculators. The old familiar process was started all over again.

Competition for property became so keen that even up to last November the newspaper real estate columns called attention to dwellings changing hands three times within the course of a week. Rents went up like a skyrocket. For a time the speculators reaped a harvest. A few hundred dollars invested in a form of agreement of sale, which is really nothing more nor less than an option, brought in a few thousand. The ratio of increase was not as great in the case of higher priced properties, of course. But Albert M. Greenfield, recognized as the most active of the real estate speculators in Philadelphia, had one property on Arch street held for sale at $45,000 until the day the site was selected. It is now held for $65,000. In other cases the increase was much greater.

Use "High-power" Methods

THE speculators soon found that canvassers going from door to door or calling on the recorded owners of property within the area were too slow. So some adopted the methods of the bucket shop. They took to the telephone. Young men were put to work calling up owners, trying to find properties that could be "bought" on options of 30 to 90 days. As stated above, that continued until the latter part of last year. Then even the speculators began to find that they had reached the end of that phase of the game. It was no longer possible to turn over properties as quickly as before.

To illustrate what had happened, the story is told of a city official who walked into the office of a large Jewish real estate dealer seeking information about where he could dispose of an option on a piece of property in the heart of the Sesqui area, as it had become known.

"We're not buying any more; we're selling," he was told. "We have $2,000,000 in real estate options right now and we don't know what to do with them."

That means that unless perhaps $10,000,000 in cash, and 30 to 50 million dollars in mortgage money can be obtained by the holders, they stand to lose the $2,000,000 already "invested." In some instances original owners of the properties will profit. In others, earlier speculators who got out from under are the winners.

For business or other reasons nobody in public life took the trouble to call a halt on what was being done. The petty bickerings in the association continued, however, and, finally, after a storm of criticism, the mayor resigned as president. One of the official acts for which he had been most severely criticized was the appointment of a publicity director. It was his first appointment. The opinion of the other directors was that the director in chief of the exposition ought to be permitted to select his own press agent—when they found the director. But regardless of that the mayor appointed Victor Rosewater, a former Omaha publisher. So much fuss was raised that his title was changed from publicity director to assistant to the president. He remained in that job even after the mayor's retirement until one of the numerous resignations that followed provided the opening for his appointment as secretary of the association, which he is today.

The idea has gained prevalence in various parts of the country, as a result of happenings while the mayor was at the head of the Exposition Association, that the whole fair scheme was being engineered by Edward W. Bok, former editor. The fact is that while Bok was one of the charter members of the association, it was not until everybody had become disgusted with its lack of action that he began to take an active part. His first move of any consequence was an offer to guarantee a salary of $50,000 a year to Herbert Hoover if he would become director of the exposition. The offer hung fire for several months, being rejected finally by Mr. Hoover at the request of President Harding.

So much time had been lost that shortly thereafter Mr. Bok put the first real crimp in the whole movement by asserting that an exposition of the scope discussed could not be made ready by 1926. He introduced a motion to delay the date of it one year. Naturally that didn't appeal to the speculators whose money was tied up in real estate. A howl was raised, and the postponement was voted down. Nothing was done on some other suggestions made by Bok designed to get something started. It may be well to emphasize at this point that although the association has been in existence nearly two years, not a single building or foot of land has been taken over or condemned for the exposition; there is no director, no funds are available and there is no detailed plan as to where the money is to come from to create the show.

John Frederick Lewis was named president of the association to succeed the mayor. In a few weeks he resigned. Then he agreed to hold on until a successor could be appointed, but under the circumstances he could not be expected to take any action. In the meantime opposition began to develop on the part of business interests that had had enough of inflation during the war. The North Philadelphia Manufacturers Association, led by Samuel M. Vauclain, president of the Baldwin Locomotive Works, came out openly against the fair.

Resignations Pour In

PRIOR to that, Alba Johnson, former president of the Baldwin Works and former president of the Chamber of Commerce, had resigned from the board of directors of the association. Mr. Johnson, with Mayor Moore, was one of the five incorporators. With him into retirement went William Potter, former minister to Italy. In an effort to repair the damage done by these defections various persons still apparently in favor of the exposition talked mysteriously of "interests antagonistic to the celebration." No satisfying explanation was ever made for the two resignations. The story was that they had been directly approached by a man high in public life seeking to interest them in a real estate transaction depending on the exposition for its success, and that they quit in disgust. Certainly they could not have been unaware of the extent to which real estate speculations had entered into the movement.

The scandal had penetrated to Washington by the middle of last year. One Congressman said he had heard that speculators were buying up marshland to resell at a high price to the exposition. Various desperate efforts were made to get things going. E. T. Stotesbury, Philadelphia partner of the banking house of Morgan & Company, had been a member of a finance committee for a year, but had done nothing. It was whispered about that he and Bok were enemies. A final effort was made to bring them together. The presidency of the association was offered to Bok. He sent in a list of the things that must be done before he would consider it, indicating that even then he didn't care for the job. One of his stipulations was that Stotesbury consent to become financial director of the exposition, assuming full charge of raising all funds. The directors elected Bok president without meeting any of his requirements, and he promptly refused the job.

Although Philadelphia is the third largest city in the country, it is provincial in many ways. For one thing, it is common knowledge that no great financial undertaking such as the Sesquicentennial can hope to succeed without the approval of Stotesbury and his banking house of Drexel and Company. Accordingly the speculators were pinning their faith to a great extent on the success of the exposition association directors in inducing Mr. Stotesbury to take an active part in directing its financial affairs. There was little to encourage them during 1922. And then, just as the new year started and the revised 15 million dollar "plan" for the exposition had been framed, Stotesbury resigned. At the same time former Governor Edwin S. Stuart also resigned.

Even then none of the directors would ascribe the disintegration of the exposition to its proper cause.

Yes, Sir! Huck Finn and Tom Sawyer Still Live

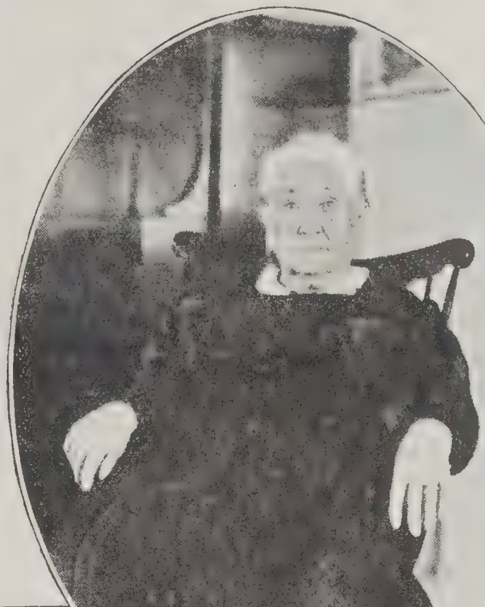
A Visit to the Alley, and to the Cave, and With Becky Thatcher Brings Back Vividly the Mark Twain of Hannibal, Missouri

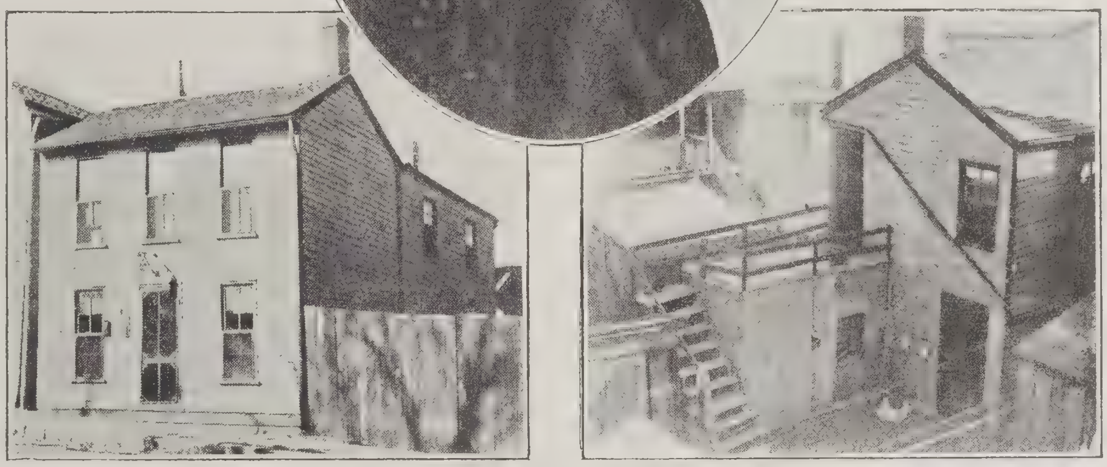
By WYMAN SMITH

AND you would agree with me if you had stood in the alley; the alley in which Mark Twain played when he was a boy. A noon sun flung fence and building shadows upon the cinders, beyond in the distance rose the Cardiff Hill of Tom Sawyer, houses cluttering its once deserted slope; and near by the head of a black cat projected from a runway. The head projected and withdrew suddenly to reappear carefully with an inquisitive perk to the ears; the ears pointed in the direction of a small boy who with cap awry was shying stones at various objects from knotholes to fence posts.

The small boy might have been Huck Finn returned—at least the cat considered him as dangerous as any "Black Avenger of the Spanish Main" and withdrew precipitately only to scamper across the alley when Huck Finn had passed. Perhaps Huck Finn's follower wasn't dangerous, but cats are wise in knowing that feline and boy temperaments rarely mix without an explosion. Huck slouched across the street and disappeared around the corner of Becky Thatcher's old home—turning a sly glance toward the home of Mark Twain as he passed; he may have been expecting a chase from some woman with a broom.

I didn't see Tom Sawyer that November morning, but anyway he was a rather complex person, having been rolled into book crust from a mixture of Sam Clemens, John Briggs and Will Bowen. But around Hannibal, Missouri, even today linger many suggestions of the St. Petersburg made famous by Mark Twain in his writings while it is somewhat different and has acquired a mask of clouded smoke and the irregular teeth of many buildings; he liked to remember it as "the white town drowsing in the sunshine of a summer morning—the great Mississippi, the magnificent Mississippi rolling its mile-wide tide along—the dense forest away on the other side." Those forested islands of the bottomlands which even today the Mississippi has preserved in superb splendor he glimpsed when he wrote of a camp-fire scene, "the climbing fire lit up their faces and threw its ruddy glare upon the pillared tree trunks of their forest temple, and upon the varnished foliage and the festooning vines."





Above—"Becky Thatcher"—sweetheart of Tom Sawyer—who lives near Hannibal, Missouri. She is Mrs. Laura Frazier, nee Laura Hawkins, sweetheart of Mark Twain. His childhood home at right and back porch and backyard in Hannibal, Missouri.

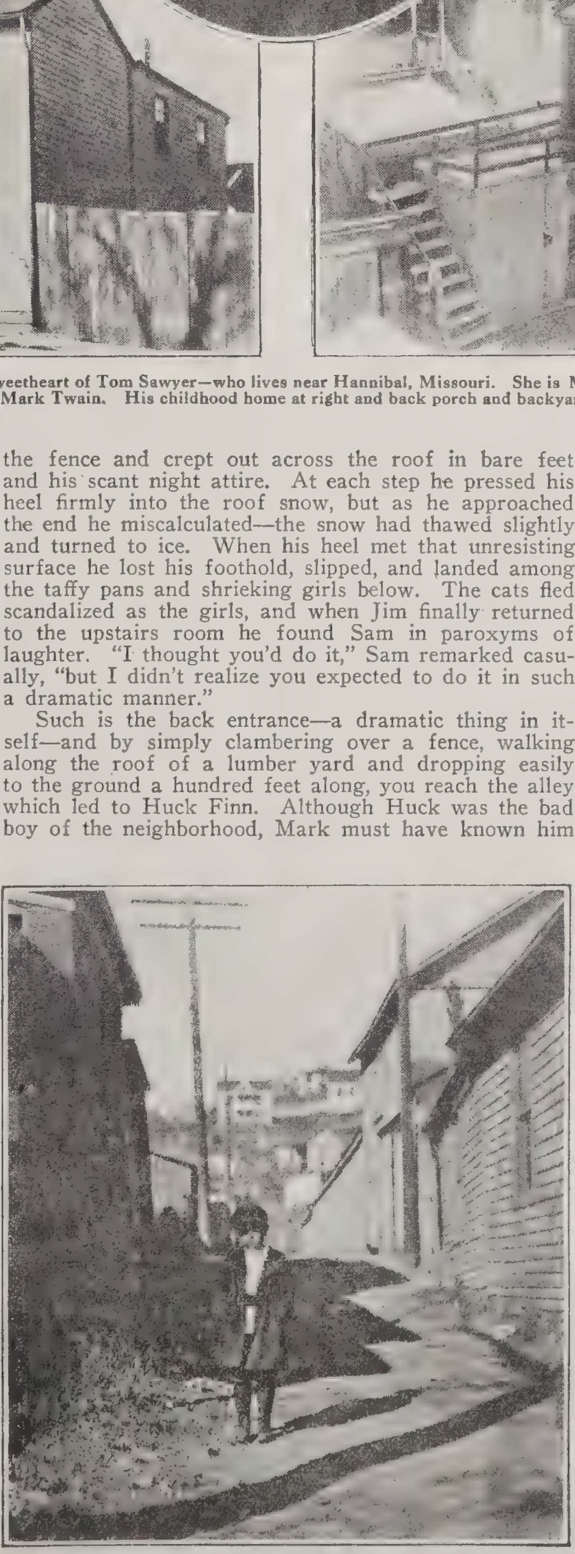
Cardiff Hill, too, beyond the alley he saw in that memorable whitewashing scene. He pictured clearly the ingenious Tom Sawyer, making the yard task of whitewashing his fence appear so remarkable that all the boys in the neighborhood were willing to pay him for the privilege of using the heavy whitewash brush, but he did not forget to pause for a survey of the surroundings. For "the locust trees were in bloom and the fragrance of their blossoms filled the air. Cardiff Hill beyond the village and above it was green with vegetation and it lay just far enough away to seem a delectable land, dreamy, reposeful, and inviting." Somehow it was the privilege, or was it the genius, of Mark Twain which in such touches proclaimed his capacity and his greatness; that and more it must have been for his books have been translated into more foreign languages than those of any other American. Whether writing of boys and their pranks or of Joan of Arc he possessed that spark of universal understanding which brought him friends.

However, it was in the experience of his childhood that Samuel Clemens, then called Sam, obtained the background for Huck Finn and Tom Sawyer—nor could he have selected a better place.

The old home into which his family moved when Mark was a lad has now been presented to the city, and in it have been collected some of the mementos of the author's life. In one corner hangs the chair (it has been hung to protect from wear by those who insist upon occupying the man's throne although they could not wield his scepter); on the wall hang letters he wrote, and interspersed between them are photographs and sketches of himself and of early landmarks. On the floor lies an old carpet, brought from his later home in the East, its tattered remains barely covering the rough pine boards. At one side is the black hulk of a coal stove, and directly across from it is the closet from which Sam may have stolen his mother's jam and jelly. The entire building poses in a recollective attitude as though it still heard the din and hue of boys throughout its rooms.

Out in the backyard the wooden flight of stairs which supplies an entrance to the second story has only grown more dusky through the years. It leads to a flat roof over a shed and then into Sam's bedroom where from his window he once enjoyed the spectacle of watching Jim Wolf participate in a serio-comedy. The two boys were alone, down in the yard Sam's sister was entertaining her girl friends with a taffy pull, out on the fence two cats were meowing and spitting. Jim Wolf, seeing the cats, determined to fling them off the fence and crept out across the roof in bare feet and his scant night attire. At each step he pressed his heel firmly into the roof snow, but as he approached the end he miscalculated—the snow had thawed slightly and turned to ice. When his heel met that unresisting surface he lost his foothold, slipped, and landed among the taffy pans and shrieking girls below. The cats fled scandalized as the girls, and when Jim finally returned to the upstairs room he found Sam in paroxyms of laughter. "I thought you'd do it," Sam remarked casually, "but I didn't realize you expected to do it in such a dramatic manner."

Such is the back entrance—a dramatic thing in itself—and by simply clambering over a fence, walking along the roof of a lumber yard and dropping easily to the ground a hundred feet along, you reach the alley which led to Huck Finn. Although Huck was the bad boy of the neighborhood, Mark must have known him and frequented his haunts. He might even have clambered the fence to elude his mother's watchful eye.



A black cat watches a small boy down Huck Finn's alley.

Sam was full of pranks—in school he cared nothing for anything except spelling. Yet in that he won the medal week after week and even traded it with the boy who wore the good conduct medal. Once after he had been in school only a few days he was sentenced to a whipping and commanded to fetch a switch from out-of-doors. Sam proceeded as ordered, but when he reached the school steps he was confronted by an enormous problem—all the forest stretched away before him, all the sticks were too large and heavy, all the switches appeared too dangerous. Across the way, however, was a lumber mill and when Sam returned he laid a lean and limber shaving on the teacher's desk. That did not excuse him for another boy was sent for a switch and so effective was the punishment that when Sam returned home that noon he told his mother he didn't like school. He was sent back, nevertheless, for Mrs. Clemens found him enough nuisance generally. "He drives me crazy with his didoes when he is in the house," she once admitted, "and when he is out of it I am expecting any minute they will bring him home half dead." One day indeed Sam was carried home from a drowning scene in which he nearly lost his life (one of two escapes which he later increased to nine) but she insisted firmly, "People born to be hanged are safe in the water."

One prank, however, nearly caused him trouble. With his gang he had been working each of several Sundays at a big boulder on top of Cardiff Hill. They had dug and pried, poked and lifted, and one morning they succeeded in dislodging it. They had intended to give it some sort of direction, but so quickly did it roll that it had gone shooting down the slope before they could wink an eye. Suddenly as they watched its course they were gripped with horror—below in the street and in the very course of the plunging rock drove an old darkey with a donkey. He saw the danger, tried to whip up the mule, but failed miserably and the plunging, jumping rock rushed upon him. The boys above waited until it bounced for the last time and then fled to the woods not to reappear for several days—they firmly believed even then that the sheriff would be waiting for them. That bounce saved the darkey—the stone catapulted over his head and crashed into the roof of a blacksmith shop across the narrow street.

Later on Sam received another scare—with John Rogers he had been out too late in the night to gain admission to his home. They proceeded to Mr. Clemens' office, a wooden frame with three windows and a door in front, located at that time in the very middle of "hell's half acre." Altogether it was a convenient place for a justice of the peace, as Mr. Clemens was, and only that night a group of men had carried a dead man inside and placed him on the floor of the entrance. Sam and John entered shortly afterward, and unknowingly selected a spot adjacent to the murdered man for their bed. They were comfortable enough until the moon, swinging across the front, illumined the ghastly figure beside them. No pause then—no halting at the door—the two fled through the window taking pane and sash with them. They had stood by when men were killed, they had witnessed plenty of fights yet they did not relish sleeping the night beside a dead man's bones.

Surely Mark had his gang, as does every boy, and just as surely he paid devoted attention to Laura Hawkins who later became Mrs. Laura Frazier but in his books was named Becky Thatcher. She lived close at hand—just across the street in a tall two-story building fronted with ionic columns made of wood rather than marble but of especial importance because they had been brought by water from Pennsylvania. A boy and girl affair it was indeed, but on one occasion at least Mark cried in sympathy with her, and on another he purposely misspelled the word February so that she might win a spell-down. He was a gallant, for indifferent as he was in all other studies he took especial pride in earning the spelling medal week after week. And she was well worthy of his attentions—a photograph of her in the teens shows her with long heavy curls, enchanting eyes, and features far too near perfection to be resisted by a boy. He himself chose to remember her, "with her dainty hands propped into the ribbon-bordered pockets of her apron—a vision to warm the coldest heart and bless and cheer the saddest."

And she is alive today—she lives at Withers Mills in the country where she receives graciously those who wish to meet the young princess of the fairy tale. The black curls have turned gray, but she is still the charming person, still delightful, still filled with that quaint charm of Becky Thatcher. Almost against her will

The President's Error

THE defeat of the infamous Lasker shipping bill would be an occasion for satisfaction were it not for the memory of the pathetic figure which the President of the United States cut in that bad business. No one can be made to believe that President Harding could have been persuaded that the bill was anything but bad. If it is known at Dearborn what gang was waiting to milk the country of $50,000,000 a year upon the passage of that bill, then it could hardly have been unknown at Washington. How President Harding could have allowed himself to be led out time after time, like a trained performer, to go through the stunts that Lasker suggested, is past the mind of an American to comprehend. It seems to be just a part of the stupendous stupidity that has settled down upon Washington. There would have been a time when to have thrown Lasker out would have redounded to Mr. Harding's credit, but not now. The pitiable spectacle of the President serving as Lasker's campaigner is indelibly graven.

President Puelicher Sounds Warning

PRESIDENT J. H. PUELICHER, of the American Bankers' Association, who is also at the head of the Marshall and Haley Bank, of Milwaukee, has been touring the northwestern states, addressing local chapters of the association and institutes composed of bank employes, with a view to counteracting what he terms a growing menace to banking, business and sound money, especially in the territory visited and among the farmers of the nation. Except that proposed changes, which he does not specify, are said by him to constitute the menace, nothing "educational" even in the A. B. A. sense, can be derived from his generalities.

With his business interests in the section most affected by what he terms "economic fallacies," one might expect a heart-to-heart talk on the details of the subject but he is nowhere positive except in the dogmatic statement that the Federal Reserve System, *participated in by less than a fifth of the banks of the country,* is the bulwark of national prosperity.

The fact that not all, even of the member banks, consider the system in the light described by Mr. Puelicher, to say nothing of the many who deem it the cause of the depression we are passing through, seems not to have occurred to him, for he makes no attempt to correct the impression. He does say, however, that the truth can and should be made public, and that local bankers should take farmers and wage earners into their confidence and show them that agitation for change is an error.

No student of economics will disagree with Mr. Puelicher that a more general knowledge of finance and business is essential, nor that greater acquaintance between banker and patron would be better for both; but there are few who will admit his theory that the creation of a bank monopoly tends in that direction. Yet that is a direct result of the financial legislation of the past half century, and the American Bankers' Association is opposed to every effort to break down that monopoly. This has been demonstrated in the opposition to the establishment of state-owned and co-operative banks, and this has caused much of the "growing menace" of which Mr. Puelicher complains.

Reformers vary greatly in their ideas. Some would abolish the commodity base of money; others are absolutely unshakable in their belief in such a base, if metallic, and demand the restoration of silver, thus agreeing in part to the theory that a greater quantity of money is essential; while still others do not deem the question of ultimate redemption of prime importance. A group of economists with a seemingly freer use of the channels of publicity than most, even advocate a sliding base, the amount of metal theoretically the base of the unit of value, automatically increasing or decreasing with the volume of production, as shown by index numbers arrived at by government authority.

There is one point, however, where this babel of theories meets on common ground. It is that the Federal Reserve System is an excrescence on the body politic, which, however useful in the original intention, has developed into a cancerous growth under recent management. They agree that the right of issue should be free to all banks, through direct connection with the Treasury. This means the elimination of the Federal Reserve. Such a currency would be secured by government bonds deposited by the issuing bank with the Treasury, and bearing no interest.

The virtual result of this would be the substitution of demand notes for interest-bearing bonds, the profit going to the people.

If Mr. Puelicher will oppose these specific theories and demonstrate the degree of menace they constitute, he may do his cause good; but as far as we can see he has contributed nothing in an educational way.

A Thoroughbred Bishop

THE passing of few men in public or private life today would suffice to give such a sense of personal loss among a wider variety of people, than has the passing of Charles David Williams, Bishop of Michigan. He died in the thick of his work, without a moment's warning and like a man for whom warnings were not needed; and as if death were to him another exaltation he became greater in men's eyes than he had ever been before.

Bishop Williams is rather difficult to describe as a churchman to those who did not know him, for to the public gaze he seemed so little of a churchman. But he was a churchman nevertheless, and there was nothing he advocated that was not solidly founded in Christian principle. Many were fond of referring to him as a Prophet, but there were many who knew him also as Priest and Pastor.

He was one of those men whom to see was to have the illusion that his place as Bishop must be very enjoyable, and yet nothing was farther from the truth. He had one serious drawback to comfort in the modern diocese—he was a stickler for the truth of things. He thought it was wrong for anyone to live by the blood or tears of another, and he said so. Had he been rector of a little parish of workingmen's families the truth of what he said never would have been challenged, nor would his right to say it be questioned. But being Bishop was another matter. Much as we desire to think otherwise, the poor Christians do not run the church. What is very much worse, sympathy with poor Christians is not a distinctive mark of the successful clergy—except it be a certain rhetorical sympathy. So, between the clerical pastry cooks and the well-to-do laity, this man who had hosts of friends throughout the land, had his own troubles among a wholly contemptible opposition in his own diocese.

This is written with a sense of distaste to instill, if possible, some sense of the difficulties which beset truth-telling in the clerical office, especially in those offices which are regarded as the prizes. Bishop Williams was the last man to say a word, and so far as this writer knows he never said one word on the subject, but it is rather a bitter reflection now that among those who hindered him there was scarcely one with enough sportsman's blood to give hail to one of God's thoroughbreds.

It is just as hard now to get the truth of Christ's principles into industrial and financial circles as it was when barefoot the Apostles went traveling and preaching through Caesar's realm.

Charles David Williams was but one; in his wake he leaves many, and his spirit will multiply through the years.

Money in Circulation

A CORRESPONDENT in Cleveland asks several pertinent questions regarding the volume of money in circulation in the United States, referring with evident doubt to the accuracy of the annual report of the Secretary of the Treasury which, he says, is given as authority for a circular placing the amount at something over five billions of dollars. If such a report is current, it is not warranted by the Treasury report.

There is no means of giving accurately the amount of money passing from hand to hand, actually in circulation. The Treasury report gives, first of all, the total volume of "standard" and "lawful" money stocks, which at the close of 1922 it placed at $8,614,433,297. This total is misleading, because it includes both the gold and silver coin and bullion stored with the government, and the certificates held outside the Treasury, but, of course, the amount "in circulation" is not affected by the statement of total volume.

The amount of money of all kinds in the Treasury on the same date was $3,696,096,062, making the amount outside the Treasury $5,972,238,240, or a trifle more than $54 per capita, using 110,000,000 as the estimate of population.

If the circular to which our correspondent refers omits reference to the deduction in the Treasury report for Federal Reserve Bank holdings, it could have been but for one of two reasons, deception or ignorance, for it is plainly stated that the Federal Reserve banks held $1,239,399,249, leaving as a basis of estimating the amount in circulation, $4,732,898,991, or about $43 per capita, with the population figured at an even 110,000,000.

There is no way without an immense amount of useless figuring of estimating the amount of reserve in the more than 40,000 banks in the country. Its compilation would be indeed a task. But as it must be in proportion to deposits it must deplete the active circulation enormously. To its aggregate must be added the hoardings of those who do not patronize the banks, the counter money for business houses needed in the trading they do, and it is very likely that at least half the four billion dollar balance will be accounted for. Perhaps more. Here is a matter that may explain the query of our correspondent as to where the various issues of paper money are. The average citizen will find in his pocket, more frequently than in the recent past, the silver certificate, redeemable only in silver dollars; with decreasing frequency the National Bank and Federal Reserve Bank notes; in the larger denominations the Federal Reserve note, but with extreme rarity the greenback and other forms of gold redeemable paper money. The latter forms of currency include the gold certificate. They are included in the Federal Reserve holdings, and with the concentration of practically all the gold coin and bullion in the same hands, give these banks a first lien on the gold in the country.

No one knows how much gold coin there is outstanding. Gold bullion is not coin, nor is it a legal tender, yet the official reports count it with coin. The coin itself may be worn and worth less than its face, while it has often been profitable to melt them for fabrication into jewelry and other forms of business utility. Thus the Treasury and Federal Bank holdings are all that can be reported.

As to the retirement of currency, there is little to worry about as to the Federal Reserve notes. New issues are constantly made where business demands them. The volume of money in the country today is greater than a month before the report, and has gained during the entire year. This gradual inflation is being felt, but the burnt child dreads the fire, and the story of 1920-21 is too recent for prudent men to risk real property to secure unnecessary credit.

Recognizing the Gallery

DURING the filibuster Senator Brookhart introduced something of a novelty—he addressed the public, or such portions of it as filled the Senate galleries. Without knowing just what bearing the rules would have on this, it being the official fiction that the Senator who has the floor addresses the President of the Senate, there would seem to be a valuable precedent in the progressive Senator's action. Why not oftener address the people from the Senate floor? Citizens of the United States, sitting in the galleries, have often been threatened with ejection from their own Government House because they have signified in their own time-honored way their sentiments of approval or disapproval of what was being said on the floor by their representatives. The galleries were not supposed to recognize the Senators in any way. But now that a Senator has recognized the galleries, who knows what straight dealing we may be in for?

Mr. Ford's Page

THINKING is the hardest work there is, which is the probable reason why so few engage in it. Even to say this about thinking is of doubtful use, because so few have had enough experience of thinking to enable them to judge whether the statement is true or false. If it were possible, first to teach the people how to go to work to think, and then to think, there would be hope for all sorts of things.

"The people are thinking" is a phrase we often hear; "The people are thinking and something will happen if there is not a change." But when you hear this hopeful news and try to verify it, you discover quickly enough that it is far more arousing than true. An analysis of the situation in which such a report is passed usually indicates that the people are not thinking at all, but are beginning to feel a certain pressure which is rendering them restless, which pressure if continued long enough may yet set them to the serious work of thinking, but is seldom continued as far as that.

In the long, long story of the soul of the people, it may be providential that for the present every person is not a thinker. It may be that the earth until this time has not been ready to support races given to thought. It may be that if everyone were a thinker at this stage of our common life, we should find life not as pliable as it will one day become, and so all the thinking would be frustrated. We cannot say positively as to that; at the best it is but speculation; but when you begin to see that possibly everything has been about all that it could be up to the present time, then it may be true that thus far there has been enough thinking, at least as much thinking as could well be.

One feels, however, that regardless of the fact that up to the present time everything has been about all that it could be under the circumstances, there is a sense in which from this moment forward a new era may emerge—if the necessary human components of a new era decide so.

Perhaps the most that one can hope for now is to drive home a conviction that, as a people, we have not done much thinking. If we think we have been thinking and find out that we have not, the jolt of discovery may be of service to us.

It is interesting to speculate whether the brain originates or only transmits ideas, whether the mind really originates thoughts or is a wireless that catches them out of the great invisible and translates them into terms of our experience. A decision made upon scientific grounds may never be entirely satisfactory, but an opinion arrived at by experience may become very useful as a working hint. Most of us will say that ideas have come to us without expectation of our own, certainly without conscious effort of our own, and have not been inferior ideas either. Sometimes it does seem that the air is full of messages and that those whose receivers are attuned to the messages catch them. Whether these are ideas originating in minds all about us and are being broadcast in the ether of universal mind, or belong to a general source of ideas, is one of the questions we play with occasionally. The point is, we don't know.

THE secrets of life are open to the thinker. Thinking is the work of digging to the foundations and has the aid of higher lights. Merely having ideas is not thinking. Our minds, when they are not focused on a worthy work which engages every faculty, become the playground for ideas, but they are always other people's ideas, they are not our own, and they are not usually worth anything except the momentary excitement they cause. We prefer the swarm of other people's ideas to our own thinking, because thinking is the hardest kind of work a mortal can do. And just because it is hardest, the higher rewards are reserved to it. Thinking calls for facts; facts are found by digging; but he who has gathered this wealth is well equipped for life.

But we do know that this experience of receiving ideas is a real experience. It seems also that the degree of receptivity is in proportion to the degree of activity on the other side; that is, if one uses the mind quite actively, the mind is thereby made keener to catch impressions which do not seem to originate within it.

And whatever ideas may come, none ever comes without making a demand on the voluntary action of the mind in realizing or fixing its value. The very best ideas when they come, tax the intelligence afterward to work them out and make them the useful and general possession of men.

So that, practically, the academic question is settled: the mind is neither one nor the other; it is both. It receives and it also works. But "thinking" pertains more to that less romantic activity which we call working.

Just to have ideas is not necessarily to "think." Probably the man who comes to you most frequently with "ideas" is the man who has never thought one through in his life. His only notion of the value of ideas is derived from the excitement which they cause in him. And as some of the best ideas are not exciting or stimulating at all, his judgment on ideas does not indicate even a reasonably competent mind.

It is easy to have ideas, but whose are they, and what are they worth?

Think of the experience of the average mind during the course of the average day. Think of the tens of thousands of impressions, ideas that swarm across it, as passengers over a bridge. From newspapers and signs and voices come a perfect torrent of ideas respecting all the things in creation, from the merits of a particular brand of chewing gum to the care which is advised for an immortal soul—all these clamor across the mind. And when they stop clamoring, we get books or go to plays to start another procession of ideas. Whose are they? Certainly they are not ours.

So that merely having ideas is not thinking. Merely "having something on my mind" is not thinking. Merely "wondering" is not thinking. Merely "worrying" is not thinking. Merely listening with all intentness to catch and remember something that someone is offering as the essence of wisdom, is not thinking. You can listen and study and understand, without having done any real thinking at all. The clergyman who says, "Why, my professor in theology taught us that . . . ." shows that he understands what his professor taught, and even understands it in relation to another relevant subject, but he does not thereby indicate that he has done any thinking on the subject.

We have intelligence to spare; intelligence is ability to receive. But we have little thinking. Thinking is creative or it is analytical. Intelligence comprehends the outlines of a thing. Thinking breaks it into its elements, analyzes it, puts it together again.

We do little thinking. Someone else arranges our indignations for us. Someone else arranges our approvals for us. You don't know why you think a certain man great, except that some newspaper said he was. Newspapers create public reputations now; they never create public characters, however. The point is, you haven't the facts and you don't know, yet you think you do know.

You know something is wrong, but you don't know what is wrong. Why don't you know? You seriously start out one day to think the thing through, actually to find out what is wrong. And then you stop because you have no facts. You cannot run the gristmill of the mind without facts. But to get facts you have to dig, and digging is work. It is easier to go to the journalistic or political bargain-counter of ready-made ideas and get fitted to a lot of hand-me-down opinions.

But if you would think and dig and build your foundations slowly, carefully, as you would build a cathedral, you could have something after while. Thought is not a series of illuminating flashes, it is deep dark mining amid the accumulated rubbish of the world's illusions and the world's laziness.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Wall Street's Exploiting of the Cotton Crop

Exchanges Multiply "Supply" in Buying and Selling Mythical Bales

By WILLIAM BUTLER

WHEN the sight-seeing busses of New York City pass through Wall Street, the guide, with megaphone to his mouth, jocularly cries: "This is Wall Street. It is bounded on one end by East River and on the other by the graveyard of Trinity Church. Its ends are the river and the grave. So, if you speculate here—take your choice of either end."

This dense, narrow street is the imperial home of the American Caesars, where pompous wealth and power decree the fate of the busy world. These Caesars are mighty speculators, ruthless, manipulating the destiny of peoples. Their speculations are so overwhelming as to dictate the movement of world commodities, such as cotton, the platform of American Presidents, the rise and fall of empires, the hopes and sufferings of humanity, or the fate of anything in the human category that offers emolument. Speculation is the Roman Colossus over all. The pagan temples where they worship and offer up the soul of the universe to the deity of speculation, are represented by three mammoth organizations, in reality, the Three Fates of American industry. These are the New York Stock Exchange, the New York Cotton Exchange and the Chicago Board of Trade. Although the latter is at Chicago, it is nevertheless an integral part of their system of monopoly.

The extent to which speculation is carried, the machinations of brokers to induce speculation, the losses to the working world, the reaction upon the fortunes of agriculture and the psychology of the nation, make a story of wanton adventure, as bold as one dares tell to the judgment of America.

The district attorney in New York, in prosecuting a cotton exchange recently for bucketing, characterized the brokers of the exchange as "night rovers in finance," which gives us a picture of the type of men about whom we are to hear.

All brokers are not bad; many are fine men, but they have grown up in the corrupt system and do not fully realize its baseness.

A number of years ago, when I lived in the South, my imagination was fired by stories of the fortune that could be made by speculating in cotton futures on the exchanges. I had accumulated $1,200. I took the money to a local broker and offered to buy cotton futures which, let me explain, is buying something you never see, buying a contract for the future delivery of cotton which is never delivered, except in isolated cases. The order is telegraphed to a New York or New Orleans cotton broker, who goes through the formality of purchasing phantom cotton on the cotton exchange.

The local broker looked at me frankly, and asked: "Young man, have you ever speculated in cotton?" I hesitated, but admitted to my ignorance of the game. "Cotton speculation," he explained, "is the meanest game in the world. Even men who have followed it for years go broke. You can't beat it. Put your money into your pocket, or invest it in substantial bonds."

I was discouraged. I went to another broker, who was not so appreciative of the pitfalls of the game. He accepted my order. I traded in cotton futures for two weeks, and of $1,200, I had left at the end of that time a capital of $5. My eyes began to open to the hideous and fateful side of the game. About that time one of the great lawyers in our community committed suicide because of losses in speculation on the New York Cotton Exchange.

I wondered if the world realized the appalling gravity of this mad game. I talked with business men about it, and took trips over the South. I was amazed to hear of the fortunes that had been lost by noted Southerners. I saw men come into brokers' offices, sink their savings in cotton futures; and after a short while, would see these misguided men lose every penny. Then, utterly discouraged, they would throw up their job and leave home and family for parts unknown. Whisky never wrought such havoc so quickly as speculation. In spite of all, the temptation lingered in me to trade in futures. I wanted to recoup my loss.

Goes to New York

ONE DAY I received a letter from a Wall Street broker, unknown to me, requesting that I give him an opinion on the future course of prices. I complied with the request. He replied and pronounced my opinion a masterpiece of economic thought, which I foolishly believed. He even went so far as to flatter me by publishing it. A close correspondence followed between us. I wrote several opinions on prices, which he published.

Finally, he solicited my account and invited me to New York. I accepted the invitation, but first visited the New Orleans Cotton Exchange and studied its operations. This exchange operates under the guidance of the New York Cotton Exchange.

In New York I was surprised to find that my genial correspondent was a Jew, adorned with an American name, and also to note the number of Jews connected with the cotton trade, who confessed to their ignorance of the culture and marketing of cotton. After receiving me with profuse cordiality, the Jew broker began a gradual pressure to influence me to trade in cotton futures. The whole infernal scheme soon leaked out. He had picked my name from a professional mailing list, furnished by southern brokers, and had secured a report on my newly made bank account; and for months had cleverly corresponded with me to pull me into the field of speculation.

I remained in New York. I associated mostly with brokers. The years that followed were spent by me investigating cotton marketing from every angle.

I found that the fine letters of economic thought and buoyancy, signed and published by brokers and dispatched to their southern clients, are not usually written by them but by professional market-letter writers, trained in the use of persuasive words to induce speculation.

Most of the clients of cotton brokers are Southerners, who are naturally optimistic on prices and dislike predictions of lower prices. This economic psychology causes them to be chronic buyers of cotton futures, bulls through and through. They refuse to take the other side of the market, the selling side of the bears. Brokers, knowing this, flood the South with bullish propaganda to please its sunny, friendly temperament; to make the Southerner feel they are his friend, and to inspire him to buy heavily. They quote patriotic expressions, such as J. P. Morgan's "He who is a bear on America will go broke."

A graphic experience came to me. I was engaged as a market-letter writer for a reputable house. Prices began to tumble. I feared that a big decline was in order. I prepared a letter urging the South to liquidate and to keep out of the market for a while. The head of the cotton house read the letter, and then called me aside. He said: "You know such a letter will not only cause our clients to stay out of the market but to withdraw their accounts. The nature of a trader is either to trade or to take down his account. Just now we can't stand heavy withdrawals. Write a bullish letter, urging them to buy more. They have made profits and can stand a little loss."

What chance has the client? Either he does not beat the game, or if he does, his next effort must be to beat the broker to the profit. The game is a two-sided monster that swallows him, if not by one head, then by the other.

How South Is Caught

IF THE South is the buyer, who is the seller? The South, which raises the cotton, buys it, speculatively, from the New York or New Orleans broker, who produces nothing but chalk-marks. Does the Southerner think that he can beat the broker at his own game, and get away with it?

The South buys when prices are advancing, first in small orders, and later, if the advance continues, buys in a rampant way. The word goes around the trading pit of the exchange that the South is buying. Brokers who have sold to the South, concertedly break the market by heavy short-selling, and as an excuse, report to the South that the market was over-bought and was due a reaction. The trustful Southerner swallows his loss, hoping to make up for it the next time. Thus, the South is a reservoir of flowing gold to the pockets of cotton brokers.

In their natural course, prices should go up on good news and down on bad news, but prices on exchanges invariably go down on good and up on bad news. The reason for this is manipulation. The public buys on the strength of good news. Brokers sell to the public, and in turn smash the market to enrich their purses. I have seen the public literally buy its head off but the market refuse to advance before first having a break.

The big client of a broker on hearing of improved conditions abroad, rushes in and buys 5,000 bales on the exchange, at, say, 20 cents a pound, which are sold to him by two or three floor brokers of the 80 or 90 that crowd the pit of the exchange. The brokers selling the cotton can immediately offer two or three hundred bales under 20 cents, at 19.95, and lower the price. They can keep offering cotton down, and if followed by other brokers who have sold to the public, can develop a wholesale selling drive. Wires flash the quotations far and wide, showing that prices are falling. Outside traders become alarmed and join the selling. The market breaks 50 points, to 19.50. The client who bought the 5,000 bales rushes in again to know the reason for the selling. The word comes from the floor of the exchange, that "big operators are unloading. Lower prices imminent." In fear, he throws his cotton overboard and charges the loss of $12,500 to the inevitable risks of speculation. In this way, brokers can often break the market with comparatively little selling and on frivolous pretexts.

Such a corrupt condition forces large traders to speculate behind dummies, and to scatter their orders among brokers, in an effort to keep the big inside professionals from knowing of their activities.

Under the magic of the Federal Reserve Act, national banks can multiply the dollar by 10, meaning that every dollar deposited with them furnishes a basis for $10 worth of credit. This pyramiding, of course, increases the circulating volume of credit, but at the same time lowers the value of money and makes your dollar and mine buy less.

Cotton exchanges break all records for multiplication, by increasing supply by 160. They take one bale as a basis for trading in 160 phantom bales. I have before me an interesting memorandum from the Inspection Bureau of the New York Cotton Exchange, the leading exchange of its kind in this country. Every bale delivered on the exchange must, under the statutes of the United States Cotton Futures Act, be first inspected by this bureau. The memorandum gives the number of bales inspected during the whole of last season, from August 1, 1921, to August 1, 1922, as 188,014 bales, which is large when compared with inspections of the past four years. Add to this the inspected stock on hand at the beginning of last season, some 125,000 bales, and we have a total of 313,014 as the season's whole supply at New York for sale and delivery upon the New York Cotton Exchange, and the basis for trading operations.

Against this small amount of lawful cotton is the huge load of speculative cotton sold at public outcry on the exchange. The Clearing House of the exchange refuses to disclose what the figures are. The amount has been variously estimated from 35,000,000 to 75,000,000 bales, and for both the New York and New Orleans exchanges, from 50,000,000 to 125,000,000 bales per annum. The more one goes into the question, the more one finds that half the truth is not known.

In searching judiciary records, I find that a prominent officer of the New York Cotton Exchange stated, under oath,* that in November, 1921, "dealings" on the exchange totaled 14,000,000 to 15,000,000 bales, and for the year 1921 reached 150,000,000 to 200 000,000 bales,** which breaks all previous disclosures, *and is more cotton than the world raises in ten years, at a cost of $12,000,000,000 or more.* It is explained that this super-figure, if analyzed, will dwindle materially, as it denotes gross sales and not net supply. For instance, A sells 100 bales to B, B sells 100 bales to C, and C 100 bales to D, making three transactions of 100 bales each, or gross sales of 300 bales. But, in reality, the 100 bales that A sold to B, was in turn sold by B to C, and by C to D. One hundred bales was the basic supply of the three sales totaling 300 bales. Therefore, sales are not always indicative of supply. To reach a fair estimate of the basic supply, and to get from figures to fact, let us divide the maximum of 200,000,000 bales sold in 1921, by four—but divide it how we may, it still remains a super-figure. The figure drops to 50,000,000 bales, a drastic scaling down, and should bring us face to face with the minimum amount of cotton floated upon the market by the speculative trade in 1921. Consider it! Six times the size of the southern crop of last year, and 160 times the lawful, reserve stock at New York, or an inflation of reserves of 16,000 per cent.

In banner years of broad speculation, such as 1922, the turnover on either exchange is undoubtedly larger than the above estimate, granting it is conservative. If the exchanges were compelled by the United States Department of Agriculture, under its lawful jurisdiction, to furnish the department with a report of annual sales, this report, if published, would be highly significant and, I am sure, staggering in revelation.

Inflation of supply, such as this, lowers the value of cotton, as in the case of money in the national banks. Speculation cannot boost prices when the supply is unlimited in the hands of exchanges, save when brokers arbitrarily hold down the supply and ask advancing prices for it.

Boll Weevil Boosts Prices

THE rapid rise of prices at present comes from no gracious gift of the exchanges to the South. The basic force at work is the Mexican boll weevil. The South now produces hardly 60 per cent of a normal crop. In 1913 and 1914, before the calamitous spread of the weevil, the yield aggregated 14,550,000 and 15,136,000 bales, respectively. In 1921 the yield fell to under 8,000,000 bales, and this year the United States Department of Agriculture forecasts a production of 10,135,000 bales, against a consumption of 12,000,000 bales or more. Spinners are necessarily alarmed at the shortage and the perilous position of production, and have rushed to the exchanges to buy futures, to protect their future requirements. Under the law, they can compel delivery of the cotton they buy on the exchanges. Operators of exchanges are, for once, between the devil and the deep blue sea, and are asking high prices to take the risk of supplying cotton from the mystery of the future.

Another feature of corruption to American cotton markets, worthy of note and little observed, imposed because of our geographical position west of the Greenwich meridian, is this: Our exchanges are allied with the speculative commodity exchanges of England, at Liverpool. Daybreak in England is five hours ahead of daybreak at New York. English commodity exchanges begin trading operations several hours before the American markets open. In fact, trading on the Liverpool Cotton Exchange is two-thirds over when the New York and New Orleans Cotton exchanges open at 10 a. m., Eastern time, or three p. m., Liverpool time. Trading at Liverpool closes one hour and a half later, at 4:30 p. m., or 11:30 a. m., New York time.

The significance of this is that the markets in England get a far start on American markets. Although the Liverpool markets no longer arbitrarily control our markets, since the gold of the world is now on this side of the water, still when cables report a decline of prices at Liverpool before the opening of our markets, our markets at the opening, in sympathetic relationship, reflect all or part of the decline. Now, should our markets break badly, Liverpool usually proceeds to go to pieces *to demoralize further our prices.*

Britain profits enormously by this advantage of time. Her industrial supremacy depends upon getting our raw materials as cheaply as possible. Therefore, besides being our best customer, she is an oppressive force in American commodity markets.

It is my opinion that if speculative commodity exchanges did not exist in this country, we would lessen the depressing influence of Liverpool, and receive better prices for our wheat and cotton. Without exchanges, grain prices would be relieved from the strangle-hold of a large Chicago grain company. The speculative

*Case of the People of the State of New York vs. The American Cotton Exchange, Inc., tried in the Supreme Court of New York County, in May-June, 1922.

**This figure overturns previous estimates made by me.

The Rip-Van-Winkling of Arkansas' Ozarks

How One of America's Most Beautiful Spots Has Awakened to Progress

Above—Horseback riding is a diversion at the Ozark resorts. This is a group from Crescent College, Eureka Springs, Arkansas. Below—One of the thousands of delightful combinations of spring, rock and tree growth that add charm to the Ozark country.

By IDA L. K. CLARK

THE Ozarks have always got the worst of it, especially the Arkansas Ozarks. Arkansas as an entire state was bad enough, so thought the rest of the United States, and the mention of the name always brought a smile, tolerant but contemptuous, and an elevating of the eyebrows that said: "Yes, I know. Awful, isn't it?" But the Arkansas Ozarks were thought to be the ultra-limit—when they were thought of at all; nor should this be put altogether in the past tense, for the feeling is nearly as general today as years ago. The outside world has not awakened to the fact that the Ozarkians have awakened. If a resident in one of the "respectable" states had the temerity to say he was going to the Arkansas Ozarks, his friends looked at each other and tapped their heads significantly. "Going to Northwest Arkansas? Why don't you shoot yourself and commit suicide quickly?" were the exact words addressed to the writer by one who hesitated not for choice expressions; and others seemed to have the same thought although they considerately tempered their words either for friendship's sake or their own self-respect. Seemingly they considered it best not to excite their nerves and ruffle the calm of their mentality by going deeply into the subject of the Arkansas Ozarks as a place of residence for any one but hardened natives. That section of the otherwise incomparable United States was a necessary evil to be accepted as philosophically as possible, and the thoughts concerning it, to be thrust from the mind instanter. Ten-year-old Alice was one of a family which moved into Northwest Arkansas a year ago. When her teacher asked her where she was going she replied: "Joplin, Missouri." After struggling with a guilty conscience for a few hours she told her mother what she had said. In the heart-to-heart talk that followed, her mother asked why she had told such a falsehood. Quickly and rather petulantly came the reply: "Because I didn't want her to know we were going to that old Arkansas." Even little Alice had caught the prevailing idea and it did not fit in with her pride of location.

This prejudice against the Ozarks which is so general is largely the result of the unfortunate publication of the "Arkansas Traveler," which, because of its lilting music and the sharp retorts of the native, made it catch and spread and continue green from one end of the country to the other and even to foreign lands, while added to this, some publications here and there and a few writers seeking for something to keep the public amused, published and wrote smartly of Arkansas and its Ozarks as the ragged rim of Nowhere and its inhabitants as Old Man and Woman Shiftless and their Kids. While this idea that the Ozarks are the natural home of the uneducated, backwoods, non-progressive people, has been largely exaggerated, it has not been without some foundation in truth—*has not been.* A mountainous country, wherever it may be in the world, is always slower in development, due to natural causes, than is the open country that is easy of access and therefore a fertile field for outside influence, but that the Ozark region has been slower in maturing than other sections is only partly due to the fact that it is a country of mountains. Not the least of the reasons is that the people were almost wholly *independent of the outside world for food and fuel and feed for their stock.* They had mast-fattened pork and also beef of their own production which, supplemented with wild game, supplied an all-year variety of meat; their meal was from corn of their own raising, ground at a near-by mill; their own dairy products and fruit and vegetables, which the country so abundantly supplied, kept every family with a loaded table, while an endless supply of fuel from the timber, which was on all sides and even at the back door, was to be had by the application of elbow grease. What more could any reasonable people ask?

While these conditions do not prevail now to the extent they did in former years, there is, even today, no part of this United States that is so nearly independent of the rest of it as this same Ozark country. It is midway between the North and the South and so enjoys the modified climate of both sections and therefore can and does produce almost all those things which can grow in the North but not in the South and those things which the South produces but which the North cannot. The Ozarkian may have upon his table every kind of a vegetable from his own garden and all the fruits but the tropical varieties from his own orchard.

Another outstanding reason for the backwardness of the Ozark section has been its roads. To put it cruelly, they have been bad beyond the imagination of any one who never tried to make his way over them. To take a trip over these roads was like riding a raging sea of rocks. They would take the heart out of the most courageous and sink it in the depths of despair and disgust and vows as to the future. They were, briefly, so nearly impassable that those who were in the mountains could not get out and those who were out could not get in, consequently the progress of the outside world only infrequently touched the great mountain district that lies between the Missouri and the Arkansas rivers.

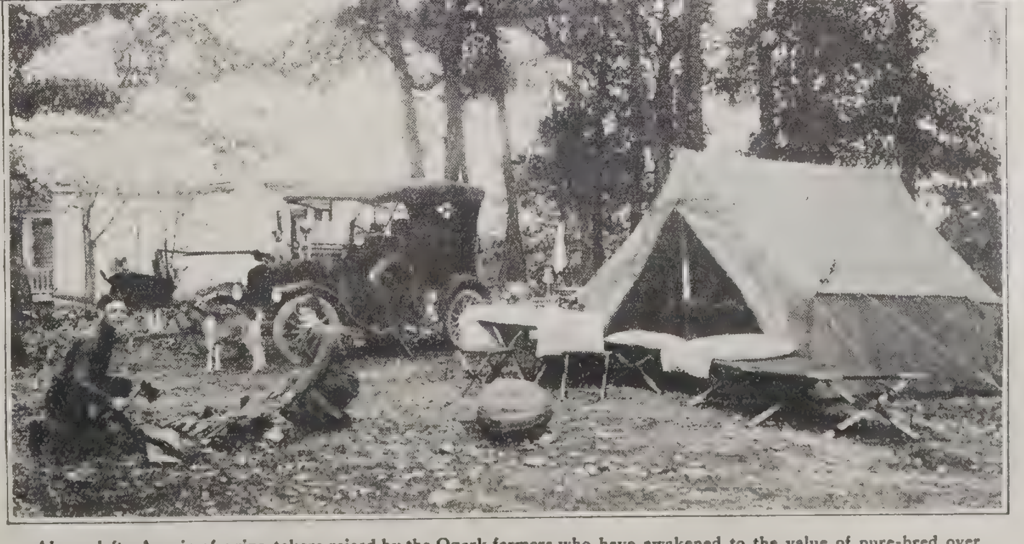
To some it might seem a pity that for so long a time the Ozark country remained undeveloped, but apparently Nature planned it so; making it difficult of access that it might not early be despoiled and stripped of its treasures. Now, after the rest of the country has been explored and turned over and over by the oil and mineral seeker, the agriculturist, the horticulturist, the stock grower, the tourist, the vacationist, the man seeking climate or an ideal home spot, the Ozarks, untouched, potential with Nature's gifts, with resources undreamed of, now smiles a welcome to that flood of humanity that is ever searching for something new and good. The bad roads are rapidly being made into good automobile highways which throws into the past one hindrance to the new development.

In the last two years great improvements have been accomplished and those who ventured into the Ozarks a few years ago now have a most pleasurable surprise awaiting them in the matter of roadways. The Jefferson Highway cutoff and the Ozark trails are the main arteries leading into and through the Ozarks, while hundreds of miles of secondary roads traverse the region, linking the principal towns into a continuous route that may be followed by the most critical motoring tourist or by the residents themselves, and a highly favorable characteristic of these roads is their sand and gravel nature which precludes their becoming dangerous and impassable after a rain. Three railroad trunk lines traverse the section and a number of lesser railroads which, together with the new highways, now make easily accessible almost all towns and valleys of the region.

Whether the awakening of the Ozarkians or the improved highways came first, would be as difficult to say as whether the hen or the egg made the initial appearance, but presumably the mental processes of at least one person began functioning before any good road was made. After that, it was easy. Some one else woke up and then there was another good road. That aroused a few others and there were more good roads, and, in the meantime, outsiders began hearing of the new doings, as news will always somehow creep out, and that advanced conditions generally. Just now the native takes no back seat in the characteristic of local pride. Having seen the advantages of certain new ways of doing, he has seized upon them with the avidity of one who has long been hungry for something but did not know what it was. Just why he is now ready to accept the innovations, when a generation ago he would have spurned them, can be explained in no way except by that reason that is always offered when no other can be found—that now is the psychological time and a generation ago it was not. It is just a case of "in the fullness of time." The native had a long, long nap and he yawned and stretched awhile but now he is up making new business and putting modern flourishes to his old work.

In every part of the world, it is the rural people's progress that is watched and remarked as the barometer that indicates advancement of the entire mass, it being taken for granted that the towns and cities will be in the forefront of fashion and progress, so if the country folk advance, everybody is advanced. The Ozarks are a pointed example of this, and so, while the towns have all the modern attractions, attractions such as electric light plants; water sys-

(Concluded on page 14)



Above, left—A pair of prize-takers raised by the Ozark farmers who have awakened to the value of pure-bred over scrub stock. Above, right—Arkansas is unsurpassed for the quality of its fruit and modern methods now employed in its culture are bringing fame and fortune to the country. Below—Modern recreation life in the Rip-Van-Winkled Ozarks. Thousands of tourists now motor through these hills.

Is League of Nations Failure? Here's Answer

A Live, Functioning Organization, Despite Fact U. S. Is Not Member

By WILLIAM ATHERTON DU PUY

I HAD been in Europe for a year and had come back home. Most of that year I had spent in Geneva, Switzerland, there in the shadow of Mont Blanc where the League of Nations has its headquarters. I had been earning my living for some 25 years by looking things over and then writing down on paper just how they appeared to me, so, naturally, I had scanned this new world agency rather appraisingly. Other writers have run into Geneva for a week, sometimes a month, and dashed off pieces for the papers. But I had stayed a year. If I was approximately as smart as the other fellows I should know more about what was going on in this village of John Calvin, which is sometimes styled the World Capital, than the rest of them.

And I had been rather favorably impressed. Then I came back home and folks began asking me questions. Was the League of Nations still in existence? one wanted to know. It was just a group of minor nations, wasn't it? Had it ever done anything? Why did it not handle the Turkish situation? What was it for anyway? How many nations had withdrawn from it? What (ribaldly) was written on the cold gray slab where it was buried? This was a stupendously important thing, I thought, and nearly everybody seems to be uninformed or misinformed about it. Since I was fresh from a ripe experience with the League I should try to clear up some of the misapprehensions. So I started this way:

No, I said, the important nations have not withdrawn from the League of Nations. There were 13 in the beginning that had been on the Allied side in the war. Then the doors had been opened to nations that had not been in the war and many more had entered. The new nations all joined. Of the nations that had fought on the German side, Bulgaria, Hungary and Austria had come in. One nation, Argentine, had withdrawn. She retired in a huff when the majority of the assembly voted against some measure she had proposed. It was not dissatisfaction with the League but peeve, because she could not have her own way that caused her to withdraw.

Since that time there has been an election in Argentine and the new president announces that Argentine is coming back in.

54 Nations Are Members

THIS action on the part of Argentine is the basis for the statement, so often made, that many nations have withdrawn. As a matter of fact there are now 54 nations in the League. They are not merely the small nations. Great Britain, France, Italy, Japan, China, are in. All those sturdy nations of the class of Belgium, Switzerland, Sweden, Holland, are in. There are only some 60 nations in the world and 54 are members. The only nations worth mentioning that are not in are, Germany, Russia, Turkey, Mexico and the United States. The only nation in the world of any importance and a stable government that is not in, is the United States. Many of these nations are frightfully hard up and it is difficult for them to meet their assessments for the support of the League. But they do the best they can. All stick. If they didn't see something in it they wouldn't keep coming to Geneva. The one nation that would feel the burden least, remains outside.

There the League is, on the lake front in Geneva in what used to be a tourist hotel. It has a staff of about 300 persons composing its secretariat. Its chief official is a secretary general, Sir Eric Drummond, and he works through a council and a dozen commissions that have been set up to handle the chief questions; there is, for example, the temporary mixed commission which pushes steadily, year after year, toward the goal of general disarmament. It is making hopeful progress. Few people know that it has worked four years toward drafting a treaty that all nations may sign and which is held to be the key to the situation. Progress is slow and not spectacular but competent agencies wrestling unremittingly with specific problems are likely, in the end, to solve them.

There is the health commission which has as its purpose concerted action on the part of the nations for the eradication of plague. The opium commission believes that, by concerted action among the nations, drug addiction can be driven from the world. The commission on the traffic in women and children is tackling the white slave problem. The mandates commission has established expert supervision of all those German and Turkish areas left over from the war. Fourteen million persons are governed by the nations receiving mandates but under the supervision of this expert authority looking on from the side lines. It is the first time since the world began that any government was ever subjected to outside, disinterested supervision.

These are but examples of the sort of thing that the League of Nations is doing. Practical concrete tasks are being performed. There are innumerable international tasks. The protection of a minority like the Albanians is a matter possible through joint action by the nations as is the establishment of a method of preventing war. The League of Nations is an agency which devotes itself to handling those problems that are world problems.

But, says the skeptic, the French went into the Ruhr and the Turks came back into Europe and the League did nothing about it. Isn't that the very sort of situation it should handle? The answer is in the affirmative. The League of Nations should have handled both those situations. They would undoubtedly have been handled with greater efficiency and nearer approach to justice if that world agency had taken charge. But it did not do so for the reason that it was not asked. It has not, within itself, the authority to act on its own initiative. If, however, some member nation had called this situation to the attention of the League, had insisted that it was a situation which threatened the peace of the world, the League could have acted. The Council of the League, nine men, of nine outstanding countries, forming what virtually amounts to an executive committee, could have been called quickly together. In the name of 54 nations it could have called upon the Turks to halt. Any nation would be bold that would fail to heed such a call. If it did fail there would be means to exercise irrisistible pressure. The council could call on the nations to clamp down the economic boycott. This would have meant that none of these nations would have done any business whatsoever with Turkey. It would have meant the immediate collapse of her entire economic and commercial structure. It would have meant shutting off imports and exports. No modern nation could withstand such pressure, Turkey would have been forced to submit to a settlement through the League of Nations. The League could have done all this if she had been asked, but she was not asked. The world has not yet learned how to use its League of Nations. It will take time.

Has Stopped a War

SO DISINTERESTED has the United States been in the accomplishments of the League of Nations that it is unaware of the fact that the latter did stop a war in just this way last year. The Jugo-Slavs were invading Albania, that wild yet heroic little country across the Adriatic from Italy, obviously to annex it. Their army was already over the border and the fighting was on. The League called upon Jugo-Slavia to stop, but she would not. The threat of the application of the economic boycott was held forth. The mere threat caused such a panic in the Jugo-Slav financial world as to halt the campaign immediately and cause the withdrawal of the troops. The instant power of this boycott was a surprise even to the League itself.

The League acted in the case of Jugo-Slavia and Albania. It had also acted in drawing a boundary line in upper Silesia over which Germany and Poland were actually fighting. It did draw that line, did secure its acceptance, and maintain peace. It was a concrete international task successfully executed. A little earlier, the League had stepped in when Poland and Lithuania were actually fighting over Vilna. It had actually stopped a war. It has maintained peace in that quarter. Then there were the Aland Islands, claimed by both Sweden and Finland. Those Baltic countries were at each other's throats. The League stepped in, sought justice, gave the islands to Finland, and Sweden accepted the award.

Thus is it obvious that the League of Nations has settled a number of disputes that had actually got to the stage of war. America is far away and prone to fail to recognize the gravity of such situations. But these are important precedents that have been established. The Turkish situation was but a little more serious and probably could have been handled successfully and confidently. A disinterested commission of the League undoubtedly could have worked out a plan of settlement much nearer justice than could a conference of the interested parties.

With the accomplishments of the past year or two in the background, there is no doubt but that the League of Nations has gained prestige. With the growth of that prestige it would seem but natural that cases of greater and greater importance should, in the future, come to it. It should be borne in mind that the Supreme Court of the United States did not get a case for two years after it was established and that its authority was twice defied in the first decade of its life. Prestige comes slowly.

Another fact that is helping the League of Nations is the flat failure of the other conferences. When the prime ministers of four nations meet to settle some great question as, for instance, reparations, each has an absorbing national interest in the issues. One settlement will be stupendously to the interest of Great Britain while another will be stupendously to the advantage of France. Each naturally votes his own interest, and agreement is impossible. It is like appointing the two litigants in a suit as judges of their own case. Results cannot be obtained. The method is wrong.

Such has been the situation all along in the matter of reparations. After four years, France resorted to force, that malignant extreme which the world is so anxious to escape.

A commission of the League of Nations, international, aloof, disinterested, could have got at a settlement that was fair to all concerned. This is just the sort of task that this service station of the nations should handle. The world needs just such an agency to handle just such tasks. Most of its trouble today could be settled by such an agency. Its greatest need is already met, but it has not come to appreciate the fact. But as the League gains prestige, matters of ever greater importance are sure to come to it. It is piling up successes in handling international differences while the other method is accumulating a long line of failures. Eventually it will get all the business. It will be a great accomplishment if it establishes itself in 20 years. There are international tasks of many sorts being performed and to be performed. The treaty of peace, for instance, authorized the League of Nations to establish the Permanent Court of International Justice, a thing that the advanced nations, led by the United States, had been trying, without success, to do for a generation. This agency of the nations, functioning as it does without cessation, was able to accomplish results where world conferences at The Hague had failed. In a single twelve-month it had secured agreement on the details of the court, had chosen its 11 judges and had got it into operation and had gone so far as actual verdicts on its first two cases. The Permanent Court of International Justice is very likely to prove itself the most important single agency ever created by the hand of man. This fact is not appreciated. The League of Nations is given little credit in America for establishing it. It will take time for the world to learn to appreciate so stupendous an agency.

How Austria Was Aided

THEN there is the question of Austria. A few months ago this one-time enemy nation there in the heart of Europe occupied the center of the stage and played a most tragic rôle. Then she made her exit and America forgot to ask why the sobs of her suffering were no longer to be heard. As a matter of fact the League of Nations had performed another of her numerous tasks. She had succored a member in distress, a member whose maladies threatened to spread to the households of the neighbor nations. The assembly of the League of Nations, meeting last September, arranged a loan sufficient to rehabilitate Austria. The money was advanced by five of her associates. It was to be administered by a commission of the League of Nations. That commission went to Vienna, became the fiscal agent of the government, gave it a currency with actual value, forced such reforms as the discharge of unnecessary government employes, made Austria a functioning unit, and accomplished a result that might well be borne in mind when the difficulties of other near-bankrupt nations are being studied.

The League of Nations is established, and is a proper agency for taking care of these situations that are the concern of all the world. It is but the creature of the nations to do their bidding. If, as time passes, it is found not to meet all the requirements, its structure may be changed, developed, perfected. But there it is, a going concern, ready for use or adaptation, capable of supplying the greatest need of governments in their international relations—an agency through which they may handle those questions that are international. The major questions are not going to it yet but it looks as though they soon would. It is meeting the great world need and its future rests on that fact.

I have carefully watched this new world agency in operation. I have tried here to get to you at home a bit of an understanding of what it is doing and what are its possibilities.

Wall Street's Exploiting of the Cotton Crop

Concluded from page 6

system of making prices not only interlocks our markets with those of Europe, where prices are based on slave labor, but forces our markets under the spell of every political event occurring, or expected to occur, in the universe. As a result, prices are not the legitimate index of supply and demand, but are more of a nervous disease that feeds upon the constitution of our agriculture and forces it to the low European level.

Gambling in Wall Street is a struggle of forces between bulls and bears. Its action and reaction upon our commercial life are, in effect, similar, but in a lesser degree, to the stimulus and aftermath of war between nations. There are rising prices, business, hope; falling prices, depressed business, despair. The New York stock and commodity exchanges act as the vanguard of business. Stocks and commodities advance in price. Business throughout the nation follows with a broad smile. The advance continues. Stocks pass from the hands of the financial powers to the investing classes, and, later, as business booms, to the masses, the last and weakest of buyers. The scheme of the powers is to distribute stocks as widely as possible to the people. The movement of prices and business opens up like a fan.

Finally, money tightens, rates go up. Prices and business collapse. High interest is the sword that cuts off the head of commercial activity. Business falls and with it the accumulations of the masses, which drop again into the pockets of the powers that be.

The course of American business is like an inverted V, up and down hill, over and over again. As long as speculative exchanges lead the march of business, we cannot have orderly prosperity. The psychology thus produced makes our business men reckless plungers, "to get it while they can," fast livers with selfish hearts.

Look at any broker's bucket shop. Note how it is screened from the public eye, barricaded like a barroom, showing the consciousness of evil doing, that his business is on the wrong side of the world. Inside, men stare at quotations like vigils at a card table.

The foregoing are some of the reasons leaders of the southern cotton world, men like Mr. Heflin, United States Senator from Alabama, Mr. B. B. Comer, president of a great chain of cotton mills, and other representatives and editors have raised eloquent voices in denunciation of cotton exchanges as houses of conspiracy to exploit the South; why some cities and states bar cotton brokerage; and why the United States Senate has requested a sub-committee of the Agricultural Bloc to make a searching inquiry into cotton futures speculation, and the evils it does to that great, rich basin called, "The Sunny South."

A Great Fleet Built Only to Be Destroyed

Wooden Armada Constructed in War Sold for One-quarter of One Per Cent

By GEORGE H. DACY

OUR wooden-ship bubble is a fiasco interwoven with romance, pathos and failure. The fleet was built only to be destroyed. When peace came, there was no longer any need for the fleet which was being hewed from our forests. There is no commodity of land or sea which depreciates more rapidly or deteriorates more thoroughly in a short space of time than an idle wooden ship. Yet your Uncle Samuel stacked his hundreds of wooden vessels on the shelf—sort of "In God We Trust" style—and hoped and prayed for a speedy deliverance from ownership of a fleet which had accomplished little other than to put a crimp of three-tenths of a billion dollars in the United States Treasury.

About five years ago, the crash and clatter of thousands of hammers, the high-pitched hum of heavy machinery, the bobbing to and fro of electric and steam cranes and gantrys awakened the sleepy old city of Alexandria, Virginia—it is a town rich in historical lore—to the fact that it had developed almost overnight as a power in the steel shipbuilding world. At present, this Virginia city is entering the second era of its seafaring prominence for again the clank and clatter of iron on iron and steel on steel resound while the cranes crane and the workmen are busier than before. This time, Alexandria is the scene of ship demolition for it is there that the 226 boats of the wooden fleet, built for $300,000,000 and sold for one-quarter of one per cent of that price, are being dismantled and salvaged and the hulls destroyed.

226 wooden vessels which cost $300,000,000 are being torn to pieces and sold as junk.

Every mechanical device known to the wrecking industry is used in scrapping the ships. Large cranes and gantrys speed the demolition activities.

Every mechanical device known to the naval and industrial world which is adapted for the speedy and efficient destruction of stout and substantial wooden vessels is being used in these most extensive shipwrecking and scrapping activities. The conditions of the sale were that the ships were to be purchased "as is, where is"; they were not to be used for transportation purposes as steamships and they were to be dismantled as soon as possible. The Shipping Board surrendered control of the fleet without warranty or guaranty of the condition, capacity, equipment, tonnage or correctness of description of the various ships. The purchasers have already begun the work of junking the ships and shortly will be operating at peak capacity under conditions which will permit of the crew of 2,500 men scrapping four to five boats a week. The fleet is anchored at Claremont, Virginia, just far enough up the James River so that salt water insects and pests, such as marine borers, cannot gain access to the wooden ships and effect serious destruction. Ten ships at a time are being towed up the James and Potomac rivers to Alexandria where they are dismantled. The shipping yards are only large enough to permit handling this number at a time.

The shipwreckers estimate that it will take about three years to dismantle the ships, prepare the salvaged machinery and equipment for sale and to market the nautical equipment. The following estimates of the material and junk which will result from these salvaging operations reflect the magnitude of the undertaking. There will be 12 miles of smokestack, approximately 200 000 tons of scrap iron and steel, 12,000 000 feet of cable wire. 5 000 tons of brass and copper, 2,500 miles of piping, 2,260 steam pumps, 9 000 tons of water tanks, 5,000 drill presses, anvils and vises, 1,800 steam winches 12,000 steam and air gauges, 5,500 tons of anchor chain, 600 tons of rope, 162 fourteen hundred horsepower engines, 64 turbine engines, 226 brass condensers, 452 water tube boilers, 100,000 000 feet of southern pine and western fir lumber, 16,480,000 bolts and washers of all types and sizes, 430 propellers, 226 bronze-mounted cannons for shooting the life lines, 1 130 miles of electric light wire, 226 outfits of galley stoves with cooking utensils and dishes, silverware and linen, 552 bronze gongs, 1,500 oak desks, ship furniture and a multitude of other equipment.

Altogether, the Western Marine and Salvage Company has purchased 305 wooden vessels from Uncle Sam, but 79 of these vessels are moored at present in Gulf and Pacific waters and will be scrapped at wrecking plants in those neighborhoods. All the boats that this company has purchased which are located at Claremont, Virginia, have been operated under their own power and 85 per cent of them made at least one trip overseas during the late days of the World War. They were all equipped with the finest machinery, much of which will be available for shore uses after it is salvaged. All these appliances are superior to those offered ordinarily for shore usage because the apparatus is armored to withstand salt water. For example, all the steam pumps are brass-lined and the other equipment is provided with extraordinary fittings and finish to enable it to resist the most rigorous exposure constantly to wind and weather.

On arrival at the shipwrecking headquarters, each quota of ships is dismantled rapidly. All the furnishings and portable equipment are first removed to special storage buildings on shore. Then, the machinery and permanent appliances are removed. In these activities, huge steel columns, supports and plates have to be cut. Acetylene torches are used for this purpose so powerful that their flame will cut away a solid steel pillar, 10 inches in diameter, in six to seven minutes. The acetylene torches are the most destructive metal wrecking tools used in junking the wooden fleet. Huge cranes, derricks, gantrys and other unloading devices are used in transporting the machinery, equipment and junk from ship to shore. After the ship is emptied, gasoline drag saws are used to cut away all the lumber and wooden work which can be removed handily. The hulls contain so many bolts at such short distances apart that it is impossible to saw them to pieces. One by one they are hauled upshore and burned.

To salvage all the iron and steel bolts and supplies left after the destruction of each hull, an enormous electrified magnet is used to abstract the material from the ruins. The magnet is about five feet in diameter and flat in shape. It handles six tons of scrap iron and steel at a time. It is lowered over the fire remains and moved backward and forward so that it locates and salvages all the magnetic metal materials. When it is full the crane is operated so that on the shutting off of the switch which controls the magnet, its load of junk falls free into the proper storage pits. Another magnetic tool of great importance is called a skull cracker. It consists of a three-ton iron ball which can be magnetized or demagnetized. By magnetic attraction, this ball is elevated 30 to 40 feet above a pile of junk metal to be broken into small enough pieces for a man to handle readily. The electric current which governs the magnetization of the ball is then cut off and the weight descends with great force on the pile. The process is repeated until the degree of destruction desired is accomplished.

To protect the ships against damage by fire during the junking period huge searchlights play on them while the water front is similarly illuminated. Electric lights are also kept going on board the vessels while lines of hose connect each ship with the water supply on shore.

Wooden shipbuilding was practically a lost art along our coasts when the project of the wooden fleet was formulated. One reason the boats cost so much was because they were built by ordinary carpenters who were broken into the boat-construction game for the emergency. The outstanding feature which makes the ships unsatisfactory for ocean freighters is because they were built under extreme pressure by unskilled workmen. The boats are not nearly so seaworthy or satisfactory as their sizes and prices indicate. Even if they had been stout ships of a durable type and construction, they would, without question, have been allotted the same fate. The superfluity of long-lived steel ships (which has congested the marine service) demanded that wooden boats make place for the metal greyhounds.

Wrecking experts figure that the Western Marine and Salvage Company will make fair returns in scrapping the wooden fleet. Labor is the limiting factor which will ultimately govern the profit or loss in the junking project. Previously, the experiences of other concerns which have purchased and tried to salvage a few of the government ships have been disastrous. For example, one company spent three months' time and labor dismantling a few boats and realized experience only. To dismantle and junk approximately 1,000,000 tons of wooden ships is a big task even though the $300,000,000 bargain sold for $750,000.

Philadelphia, Victim of Land Speculators, Sees Independence Fair Plans Fade Away

Concluded from page 2

All of them knew the facts. Tenants whose rents have been driven upward in the Sesquicentennial area have been industriously writing letters to everybody in authority—also to the newspapers. Needless to say, the newspapers haven't published them. Stories have been published at the instigation of real estate dealers to show the need of hotel accommodations during the exposition—pure propaganda to stimulate the real estate market. But prices are so high now that that no longer works.

Colonel Franklin D'Olier is now president of the Exposition Association. At the time of his election he made it clear that he had no intention of being the goat, and last year he succeeded in shifting responsibility by appointing an advisory committee of four—Ernest T. Trigg, Jules E. Mastbaum, David S. Ludlam and Ellis A. Gimbel. Mastbaum is head of the so-called motion picture trust—the Stanley Company of America, and also of the largest real estate firm in Philadelphia—Mastbaum Brothers and Fleisher. Gimbel is head of the department store of the same name. In recent weeks most of the boosting for the exposition has been done by Mastbaum, who stands to profit from the crowds that would be attracted to the city not only through his motion picture houses, but also through his real estate holdings.

The election of Mastbaum was held the last straw. It marked also the complete disappearance of circumspection on the part of the real estate speculators. Previously they had made errors of judgment that enabled close observers to see through the screen of patriotism and civic pride thrown up to hide the scramble for options. One in particular was the action of the Philadelphia Real Estate Board, which announced that it intended to call a meeting designed to unite all interests to get the exposition work started. The meeting was held, but the interest back of it was too obvious and nothing more came of that than of innumerable other meetings. Some of those who know exactly what is going on are laughing up their sleeves at a remark of Mastbaum's, widely quoted in the newspapers, to the effect that "we'll win out, or we'll die with our boots on."

It has been stated that organized opposition to the fair has been conducted by the North Philadelphia Manufacturers Association. The details of that, together with the flat and unequivocal charges made by the association that the whole scheme has degenerated into a vast real estate detail, will be set forth in another article. In the meantime, as this is being written, announcement has been made of the formation of the Anti-Sesquicentennial League to carry on the work started by the manufacturers. In its statement of purposes the league says:

"The league advocates taxes that are not burdensome, lower rents, better living conditions, readjustment of living costs, adequate homes for our population, stabilized real estate values, sufficient school buildings, speeding up public improvements, more transit facilities, improvement and extension of our water supply system, better sewerage disposal facilities, improved streets, more police protection, a *cleaner and better city to live in*. A World's Fair would not make for these things but would bring about *reverse* conditions. Therefore, the league is opposed to the Sesquicentennial Exhibition."

Public Jobs That Know No Ending: Bureaucracy Never Quits Pay Roll

Including the Story of the Man Who Drew His Salary Merely to Watch the Desks Accumulated in Washington as a Result of War Activities

By AARON HARDY ULM

NEARLY two years after the ending of the World War, a sub-executive in the government service at Washington came to need additional office furniture for his establishment. Instead of buying new desks and chairs he decided to hunt up old furniture that had been left over from the war. After considerable scouting he discovered a large array of desks occupying the floor of a privately owned office building. One desk was in use. He spoke to the man using it concerning a desire to procure the desks not in use.

"Please don't pursue the subject," pleaded the man at the single employed desk. "If you do somebody may be led to investigate, in which case I'll probably lose my job!"

For several months he had been sitting there daily, and drawing a substantial salary, with nothing to do except to watch those desks. Besides, a large rental was being payed for the office floor occupied by them.

The desks ultimately were disposed of, the floor surrendered and the hold-over war worker disconnected from the public pay roll.

An investigation would disclose any number of cases essentially the same which have gone on year after year.

Many years ago, when the government's accounting machinery was rather small, it was proposed that an auditing office that would be independent of collectors and supervisors of customs be set up at the important ports of entry.

An Official Not Needed

THE holder of this new office was given the stately title of "naval officer of the port." As it was desired that capable and responsible men hold the office good salaries were attached to it. From the beginning the places were looked on as highly desirable patronage. They have been filled generally by men conspicuous in their parties. The pay now ranges from $5,000 to $8,000 a year. Those who have investigated the subject say that there is utterly no need for them now, even if there once was; but recommendations that the places be abolished are regularly ignored.

You will find in the list of Federal Government offices one that is denoted "indexer of the *Congressional Record*." The editing of that publication is intrusted directly to the Government Printing Office where it is printed, the editing being a part of the routine of publication, like proof reading. But the indexing, while now cataloged as a part of the printing office operation, is a Capitol performance. The indexer is appointed by the Joint Committee of Congress on Printing. He receives a salary of $3,000 a year, but is provided with three well-paid assistants to do the work, which is of a purely routine nature.

Prior to a year or so ago this job was about the best in all the government service and still is a good one. This was because the holder of it was paid 20 cents for each page of the record indexed—by his assistants. This wasn't for each index page but for each one covered by the indices. A man—a Washington correspondent—who held it a few years ago told the writer that the place sometimes had yielded more than $15,000 annual income to him. Yet he was able to carry on his newspaper work as if he were not on the government's pay roll; in fact, his acquaintances generally didn't know that he held the position.

Growth of the Indian Bureau

THE place is the consequence of the desire on the part of some Congressman or Senator, 20 or 30 years ago, to provide a sinecure for a friend, possibly someone who had been worn out in the public service and had some moral claim to a pension of that kind. The office no doubt was originated as a temporary affair, and, in the beginning, when Congressional sessions were short, probably paid only moderately. But when Congress began to meet almost continuously, the place became a high-paying one and so continued for eight or ten years.

One might find other examples of larger and less excusable governmental waste than that of the indexer's job even at its worst. This particular place is mentioned to illustrate how such jobs may produce effects monumental in comparison to the actual money involved in them. There is a tradition in Washington that the indexer position once decided an organization contest in the United States Senate. The contest involved a great deal, for there entered into it the rivalries of two schools of thought of nation-wide prevalence at that time. By giving him the right to appoint a supporter to that place, tradition says, a certain Senator's vote was deflected and caused the contest to be decided as it otherwise would not have been. The decision had considerable effect upon the Senate's later actions upon several important national questions.

Thus the existence of such places have highly dangerous aspects, for even among the strongest of public men there are very few who are not influenced by considerations of patronage.

And, once set up, the element of patronage tends to perpetuate public jobs beyond the time of any need or excuse for their existence.

Investigation probably would show that the jobs once held to be merely temporary, now include some of the biggest and a few of the oldest of Federal Government establishments.

For instance, there is the Indian Bureau.

Eighty years ago this bureau was declared to be only a temporary establishment; it was then expected to complete its work within 25 years. The purpose of the bureau was to guide the Indians toward civilization and to protect them from its evils. Yet the bureau itself now seems to think that its charges are less fitted for civilization than when its work with them began. Steadily has the bureau grown until it now provides places for from 5,000 to 6,000 persons, expends annually about $13,000,000 directly out of the public treasury and controls the spending of other large sums from various trust funds in its possession. *The Indians have increased in population scarcely at all.* And nearly all persons who have studied the subject say that the government's policies as carried out by the Indian Bureau have tended *to unfit more than to fit* them for survival in either our own or their civilization.

No doubt the employes of the Indian Bureau are as conscientious and as industrious as those of any other governmental establishment. But it would be contrary to human nature for them to work themselves out of jobs to which many of them have been attached so long that they have little facility for other work.

What Overhead Will Do

THE absurd length to which bureaucratic methods may go is illustrated by a disclosure brought out in an investigation of a branch of the Indian Bureau's work a few years ago. Congress appropriated $25,000, from several million dollars of tribal funds held in trust for them, for the relief of temporary distress among the Kiowa and Comanche Indians. The money was to be spent by the bureau. **The investigators reported that all but $8.36 of the $25,000 actually had been spent on "overhead"—salaries, transportation, and so on—in disposing of the fund.**

This is an extreme example, very probably, but cases of like nature are to be found throughout the government service.

The Veterans' Bureau already gives employment to about one-half as many persons as were rated disabled on the discharge of the forces after the World War.

The inevitable tendency of such establishments is toward becoming havens for the employed rather than agencies of relief.

Even when that is not the case, the establishments so entrench themselves that only a genius for organization, combined with infinite courage, is capable of getting rid of or reforming them without doing harm.

It is all but impossible now, for example, to get rid of the Indian Bureau or to supplant its work with methods that would not operate to injure the Indians more than bureaucratic treatment has done. For that treatment evidently has so sapped them of initiative and self-reliance that the bulk of the Indians now would have extreme difficulty in getting along without the bureau.

A Congressman recently called attention to the fact that a similar policy was begun, after the Civil War, in dealing with the Negroes of the South. But the Freeman's Bureau was so patently inept that it was abandoned after a few years. That bureau's record is historically one of the most noted instances of paternalism that went wrong and resulted in great monetary waste. Yet, as the criticising Congressman pointed out, it expended throughout its life less than is now spent annually by the Indian Bureau. Historically, also, that venture of the post-Civil War extremists contributed, more perhaps than any other agency, toward complicating the Negro problem, even to this day. Had the operations of the Freeman's Bureau gone on, as those of the Indian Bureau have done, the Negroes of today probably would be in a hopeless position like that to which bureaucracy has reduced the Indians.

While it has not been conspicuous as a refuge for the professional seeker of and holder of public jobs, a thorough inquiry into all the manifold effects growing out of its operations probably would show that even the Interstate Commerce Commission is another governmental agency that has been costly far in excess of the millions of tax money spent upon its support.

Without tackling the difficult question of how far the government should go in regulating the operations of public carriers, it is patent that the regulating, as so far conducted, on the whole, has been paralleled by declining efficiency in railroad operation and increasing cost of the railroad service received by the public. For many years, of course, there was much noise about "savings" to the public on the score of reduction of rates by the commission. It would be interesting to compare the "savings" thus achieved with the $1,800,000,000 which the taxpayers had to provide to keep the railroads "going" during the war. In rating those "savings" it is well also to take into account the present and future support the public is expected to give the railroads, in the form of high rates as well as loans and other direct public aids.

The calm analyst of 1950 very probably will find that it was the government policy toward the railroads, as carried out chiefly through the Interstate Commerce Commission, that led to the entrenchment, already existing or approaching, of financial control of the railroads in the hands of bankers. That policy also is leading apparently to a condition that will necessitate the adoption of government ownership or something tantamount—the very thing that those who espouse it most enthusiastically say the policy seeks to prevent.

Will Get Treasury Guaranty

IT WOULD seem that today there are no stronger adherents of the government's railroad policies, as now applied through the commission, than the railroad owners themselves. For that policy is crystallizing into a Treasury guaranty of their profits—so they should worry!

One should not forget that the evils aimed at by regulatory establishments like the Interstate Commerce Commission already came within the purview of the criminal laws. Long penitentiary terms promptly imposed on a few railroad officials guilty of rebating and other practices contrary to law, very probably would have saved the public more than has been achieved by all the bureaucratic establishments so far set up for regulating the operation of the railroads. Such procedure would have cost the public little. Instead of applying it a vast bureau was established, manifold laws were enacted and there was put in operation a system of regulation that appears so far to have served effectively neither the public nor the railroads. And now it seems that it can't be done away with; it only can be augmented.

The same is true, though perhaps in less degree, of the governmental machinery that has grown out of the so-called anti-trust laws. This machinery operates in the Department of Justice, the Federal Trade Commission and other bodies.

Although the Sherman Act has been on the statute books for more than 30 years only one person, as far as the writer can find, has been sent to jail for violating it. That person pleaded guilty and received a very moderate sentence, which later was commuted.

No Prosecution—Regulation

WITH government machinery designed to combat them, the so-called trusts have developed and waxed fat. And recently it was announced that the government had approved the formation of a new trust of gigantic proportions—the approval being on the ground that the machinery to combat trusts is now so inclusive that it would prevent the proposed new trust becoming oppressive in its operations!

Thus runs the cycle of bureaucracy and paternalism. Instead of the crime being punished by opening the prisons for those who commit it, the crime is regulated instead. Regulation calls for vast machinery, affording innumerable jobs, and by reason of the complexities, infinite loopholes to escape punishment have come into existence. Real correction of the evils aimed at means that the horde of job holders engaged in the task will have worked themselves out of places, which fact places a peculiar strain upon human nature. Ultimately the machinery becomes so expanded that it is held that what was rated as criminal can be so guarded that it may be permitted. And government itself becomes a partner in what ostensibly government started out to estop.

Some form of communism whereby everybody becomes a public job holder is to what such an empirical approach to public problems must inevitably lead.

And there is scarcely a man in public life who dares to call a halt.

This is the second of two stories by Mr. Ulm.

Kin Hubbard, Mirror of Rural Hoosierdom

Uses "Abe Martin" to Break Images

DOWN in South Central Indiana lies a backwoods county boasting but one railroad, a primitive county seat with only about 300 inhabitants and an old log jail, and a topography such that its numerous hills are as razor-backed as its hogs.

A great deal of the land is well-nigh worthless, as a consequence of those untoward surface features; and thus you would naturally suppose her people to be poor.

And poor they are—in this world's goods.

And yet—perhaps because of their inability to coax much from the ungenerous soil—the folks of Brown County, Indiana, find ample time for meditation, for the expression of a homely philosophy of life. They are, besides, as lovable as they are old-fashioned; as quaint as they are poor. They are a living testimonial of Emerson's law of compensation.

It remained for one not a native of Brown County to tell the rest of the world, by word and picture, about her people's lovableness and charm. Being removed from the focus of his interest, he has the proper perspective; his images are ever faithful—even almost photographic.

The interpreter's name is Frank McKinney Hubbard—more commonly known as Kin Hubbard, a name more friendly, more intimate; one belonging to a man you would pick to create the well-known "Abe Martin," that genial, rustic Hoosier philosopher whom James Whitcomb Riley described as a "comical mixture of hoss sense and no sense at all," and who, according to George Ade, is "as quaint and droll as Josh Billings and Artemus Ward ever dared to be."

Mr. Ade sketches Hubbard in these swift strokes: "He is a young man on the staff of the Indianapolis *News* who ladles out a small portion of homemade humor every day of the year. His tabloid contributions are supposed to be the meditations of one Abe Martin, who lives in Brown County, Indiana, where small fields of nubbin corn nestle between the clay hills, but where the persimmon, the pawpaw, and the 'possum make amends for agricultural shortcomings. . . . Abe Martin is up to the minute. . . . His comments on men and affairs prove him to be a grim iconoclast, an analytical philosopher, and a good deal of a cut-up. His daily offering consists of two parts which are totally unrelated, but which are wedged together in one paragraph apropos of nothing in particular. . . . He has an abiding popularity in the Hoosier State for the reason that he deals in truth, maintains a kindly mood, and never hesitates to go after make-believes and shams with a good stout hickory."

And Meredith Nicholson, eminent novelist and short story writer, pays him this tribute in his introduction to a volume of Hubbard's choice morsels: "Persons who have tried all known patent medicines without relief will do well to try these Abe Martin dandelion and sassafras cocktails before turning their faces to the wall. Abe is now an established institution and no supper table is complete without him. The clods are softer under the weary hoof and the plow handles easier to manage after a moment's communion with Abe. He is Plato on a cracker barrel; or radiant Socrates after Xantippe's departure to visit her own folks in Tecumseh township.

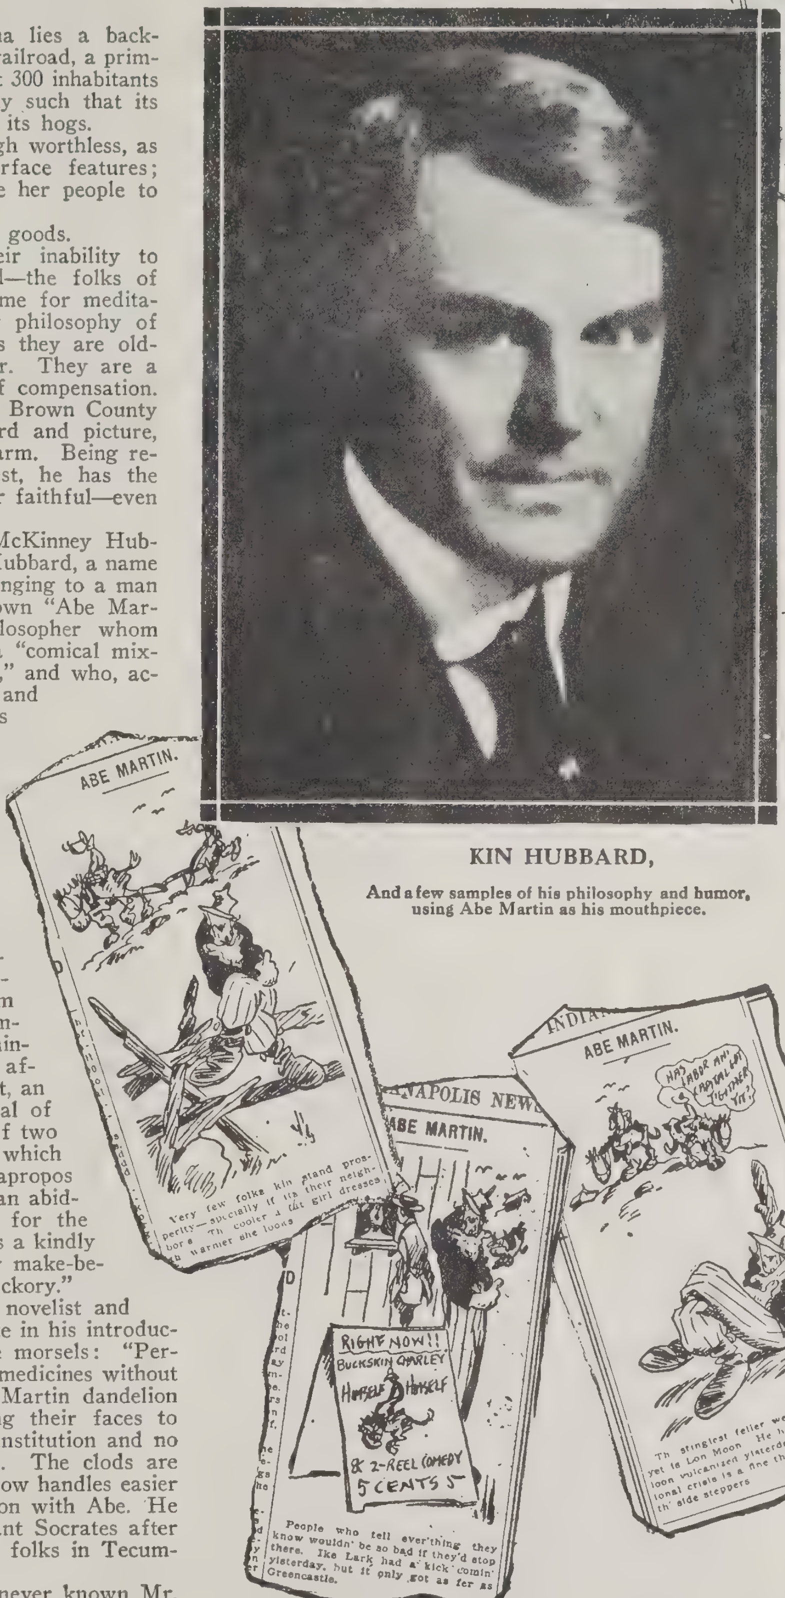
"In 15 years' acquaintance I have never known Mr. Hubbard to be serious but once, and that was when he described Bellefontaine, Ohio, as a place that the expectant pilgrim could always identify by the two sparrows on the south end of the water tank near the Big Four station. I have passed that tank 27 times since and have found Mr. Hubbard's statement accurate in every particular."

About six months before Mr. Nicholson wrote that appreciation, James Whitcomb Riley paid to his "old Hoosier friend" the following delightful tribute:

Abe Martin! dad-burn his old picture!
P'tends he's a Brown County fixture—
A kind of comical mixture
        Of hoss sense and no sense at all!
His mouth, like his pipe, 's allus goin'
And his thoughts, like his whiskers, is flowin'—
And what he don't know ain't worth knowin'—
        From Genesis clean to baseball!

The artist, Kin Hubbard, 's so keerless
He draws Abe 'most eyeless and earless;
But he's never yit pictured him cheerless
        Er with fun 'at he tries to conceal—
Whuther onto the fence er clean over
A-rootin' up ragweed er clover,
Skeert stiff at some "Rambler" er "Rover"
        Er new fangled automobeel.

It's a purty steep climate old Brown's in;
And the rains there his ducks nearly drowns in
The old man hisse'f wades his rounds in
        As ca'm and serene, mighty nigh,



ABE MARTIN.

KIN HUBBARD,

And a few samples of his philosophy and humor, using Abe Martin as his mouthpiece.

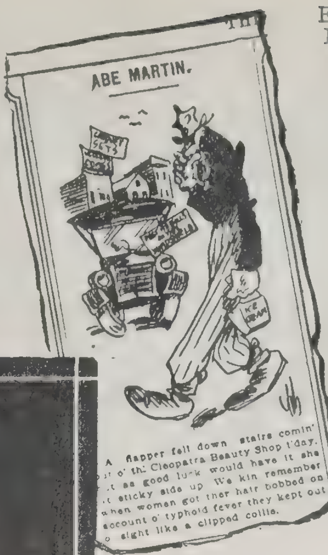
By J. M. SEABRIGHT

As the old handsaw hawg, er the mottled
Milch cow, er the old rooster wattled
Like the mumps had him 'most so well throttled
        That it wuz a pleasure to die.

But best of 'em all's the fool-breaks 'at
Abe don't see at all, and yit makes, 'at
Both me and you lays back and shakes at
        His comic, miraculous cracks,
Which makes him—clean back of the power
Of genius itsse'f in its flower—
This Notable Man of the Hour,
        Abe Martin, the Joker on Facts.*

The pictures referred to by Nicholson and Riley are also his creations—just simple pen-and-ink drolleries which he styles caricatures, but which exude that indefinable quality, akin to quaintness and charm, that typifies the bucolics of Hoosierdom.

Abe Martin is not the only character delineated by Mr. Hubbard. Ah, no; there are, in addition to his Brown County mouthpiece, such small-town folks as Tipton Bud, Tilford Moots, Miss Fawn Lippincut, Uncle Ez Pash, Constable Newt Plum, Dr. Mopps and Professor 'Alex. Tansey. How accurately their very names and dialect portray the substantiality of these vertebrae of the backbone of America—the America which once was, before the injection, into her melting pot, of aliens!



ABE MARTIN.
A flapper fell down stairs comin' out o' th' Cleopatra Beauty Shop t'day. ...t as good luck would have it she ...t sticky side up. We kin remember when women got ther hair bobbed on account o' typhoid fever they kept out o' sight like a clipped collie.

Occasionally Kin Hubbard departs from his accustomed dialectical miniatures and does a sketch for a periodical. Here, for example, the reader is likely to chuckle over the delicious humor peculiar to him. Here he is focusing his camera—or rather his X-ray!—on one of his most charming characters. "Miss Fawn Lippincut," he tells us, "is a clever recitationist and trims her own hats. She is just mannish enough to get a seat on a Niagara Falls excursion or buy chewing gum at a cigar store. Miss Lippincut gets her dramatic ability honestly, as her father tore paper for 'The Two Orphans,' at Urbana, Ohio, and later wrote some creditable calliope music. . . . Miss Lippincut is the author of 'How to Hold Your Husband's Love Thro' the Rhubarb Season,' and has sent many recipes to the newspapers that show marked literary ability."

"Who's Who in America" tells us that Mr. Hubbard was born in Bellefontaine, Ohio. The date is not given, yet can anyone familiar with his pen-and-inklings doubt his eternal youth? He is married, and, with his wife and two children, Tom and Virginia, aged 15 and 13 years, respectively, lives at Irvington, a suburb of the Hoosier capital. Since 1891 he has been employed almost continuously as paragrapher and caricaturist on the Indianapolis *News*. At present his work is being widely syndicated to newspapers throughout the country. Many of the Abe Martin sayings have been gathered between the covers of several volumes—"symphonies in gingham," as Meredith Nicholson once styled them.

Imagine a chubby-faced man of average height and build; with hair light brown and tinged with gray, as though someone had sprinkled it with steel dust; with an intellectual forehead; with a rather firm yet pleasant mouth; and with eyes which are blue, keen, and intensely expressive—imagine such, and you have an impressionistic vision of Hubbard. His eyes, especially, rivet your attention; they are truly the mirrors of his moods: through them alone he laughs, through them alone he smiles, through them alone he reacts visibly to all external stimuli.

His drollery was further evidenced by his declaration that "a railroad touches Brown County—not enough to hurt it." That is a representative Hubbardism.

A self-made man is Hubbard. He has had to battle tremendous odds all his life. The soil of Hoosierland proved fertile for this transplanted Buckeye, but time was required for the tree to take firm root. In his struggles and in his success his life stands out as a beacon light to those who would gain renown in spite of the Scylla of hardships, the Charybdis of suffering, and the Avernus of despair. It is interesting here to note that, while his text has perhaps brought him more fame than his pictures, the latter gave him his first foothold on the steep ascent to fame, for before he became the literary father of Abe Martin, he was drawing cartoons for feature articles written by other men on the staff.

For proof—if proof were needed—that he occupies a warm spot in the hearts of Hoosiers, let it be recorded that he was recently chosen by the readers of a prominent Indianapolis newspaper as one of the 10 greatest living Indianians, being classed with such men as Booth Tarkington and former Vice-President Marshall.

In all his writings the creator of Abe never descends to ribaldry. Nor can his epigrams properly be called wit. No; their paramount quality is humor, much superior to wit, for, while embracing the latter, it includes the added ingredient of love. The resultant is humor which brings forth a chuckle and yet tugs at your heartstrings; humor which is mellow, but never over-ripe.

George Ade, as before mentioned, described Hubbard as "a grim iconoclast." Well does he deserve that name, evidence of which one finds in his gloved attacks on the legal profession. Here is a typical example: "Mrs. Tipton Bud's nephew, who wuz recently convicted o' manslaughter, has been denied a new trial, as he had only one farm." And in another place Abe tells us that "Lem Granger's trial fer hoss stealin' is set fer next week, an' Attorney Tell Binkley is rehearsin' his wife an' baby on how t' cry in court."

And yet his image-breaking is never rude; one can almost detect an expression of regret on his face as he performs an unpleasant but necessary task, as when he makes Abe Martin say: "I don't think much of a dance where th' girl looks like she wuz bein' carried out of a burnin' buildin.'"

A fitting conclusion to this unfinished portrait—intended merely to whet the appetite of him or her whose sense of humor is still alive—is to quote what Will Rogers has called "the greatest gag ever written." It is as follows: "'Women are just like elephants t' me. I like t' see 'em, but I wouldn' want one,' said Tell Brinkley, today."

Author's Note.—Thanks are due the editor of the *American Magazine* for permission to use several excerpts from sketches written by Mr. Hubbard for that publication.

Mr. Harding: Justice Demands a Statement

Dismissal of Bureau of Engraving Officials Without Explanation Cannot Longer Be Countenanced

"HERE'S a paper I'd like you to see."

And Louis A. Hill, a minor official in the Bureau of Engraving and Printing, handed to James L. Wilmeth, the director, a document signed by the President of the United States, removing Wilmeth and Assistant Director James M. Fisher, and some 28 division chiefs, abolishing their places, and creating others, and appointing Hill as director, and John P. Perry as assistant director, and giving to the new director the authority to fill the vacancies created.

This was at eight o'clock at night, March 31, 1922, and was the first public action in what was promised to be the greatest scandal in the history of the nation, and one that would shake the whole financial structure of the United States.

Later developments have shown that instead of the revealing of huge frauds, the greatest wrong seems to have been the unwarranted removal of the officials, some of whom had given their life efforts to the government, under the protection of the Civil Service laws, and the whole proceeding has attracted much unfavorable comment.

Wilmeth told Hill that it was all right; his desk would be ready for him the next morning.

"No. Right now," dramatically demanded Hill.

Wilmeth asked and was permitted to remove his personal effects.

The next morning when the ousted officials, men and women, reported for work, they were met by Department of Justice operatives, and accompanied to their desks; they were permitted to retrieve their personal belongings, but otherwise were not given any freedom of movement in the mammoth building.

"For the good of the service" was the reason given by the President for his astounding action.

Rumor had it that it was because of enormous shortages and other rascality.

Claim Bureau Plot

FRIENDS of the discharged officials claimed that a certain clique in the Bureau had conspired to get the places made vacant.

James L. Wilmeth, the deposed director, was mayor of Takoma, D. C., and prominent in the civic and church life of his community. He entered the service of the government in 1895, at a salary of $60 a month. In 1910 he was promoted to the position of chief clerk of the Treasury Department by Franklin McVeagh, a Republican Secretary of the Treasury. In 1917 he was made director of the Bureau of Engraving and Printing at $6,000 a year, and it was under his administration that practically all the war securities were printed, in addition to the printing of currency and stamps.

James M. Fisher, assistant director, entered the Treasury Department in 1893, after having previously worked in a clerical capacity in Congress.

Other discharged officials were John J. Deviny, E. H. Ashworth, B. R. Stickney, Adam P. Ruth, J. J. Fisher, P. J. Farrell, James A. Chamberlain, George Jacobs, H. H. Ashworth, Frank Campbell, Ralph H. Chappell, George C. Cole, F. J. Crocker, William C. Deane, George P. Jackson, John T. Howard, Thomas F. Roche, Frank W. Larner, William C. McKinney, George V. Rose, Thomas E. Slattery, A. C. Steinbrenner, Jesse E. Swigert, H. I. Wilson, Benjamin Goldsworthy, G. F. C. Smilie, Mrs. Margaret S. Kerfoot, Miss Elizabeth Scott, and Miss Nellie Wilding.

Most of these employes had been for years in the government service, a number being almost eligible for retirement under the Civil Service Retirement Law, which provides that one on reaching the age of 70 years and having had at least 15 years service, shall be retired on an annuity. The order of removal automatically stopped any such rights.

In Service 29 Years

SEVERAL of the discharged officials were ex-service men.

The case of E. H. Ashworth is worthy of notice. He had been in the service of the bureau for nearly 29 years. He was the custodian of the dies, rolls and plates, possibly the most important position in the bureau.

He was not of the organization, but rather a check on them. The law required that he be checked up each year. A committee appointed by the Secretary of the Treasury, Mr. Mellon, spent nearly three months carefully investigating Mr. Ashworth's department. They completed their work and made their report *at four o'clock on the afternoon of March 31, 1922, and with the report went a letter commending the efficiency of Mr. Ashworth. At six-forty-five the same evening, President Harding, by executive order, dismissed and at least temporarily disgraced him.*

Senator Caraway, of Arkansas, took up the fight for the discharged officials, although he was warned by a Republican Senator, a friend of the Administration, that he would be very much embarrassed when he was convinced that he was espousing the cause of men who had been guilty of tremendously grave offenses, because he had talked to departmental officials and knew.

Senator Caraway declared that if any had been dishonest, they should be removed, but declared that no man or woman should be dismissed and disgraced, without having an opportunity to know the offense with which he or she was charged, and introduced a resolution in the Senate, calling on the President to state why the removals were made in violation of Civil Service laws. The resolution was referred to the Committee on the Civil Service of the Senate, where it has slept peacefully since.

The Senator further claimed that it was the beginning of a concerted drive on all the departments to displace Democrats, put in Republicans, and "Harding-ize" the government.

No "Pie," Says Mellon

AND shortly afterward came the famous Mellon-Dover controversy. It was claimed that Elmer Dover was put into the Treasury Department to make places for Republicans. A list of alleged Democrats, whose scalps the organization was after, was made. But in the haste a number of lifelong Republicans were included. They naturally objected. *It was stated that Secretary Mellon spoke very pointedly to the President on the subject of efficiency over "pie" as long as he was Secretary of the Treasury.* He won out. At least Mr. Dover resigned.

Various explanations continue to be given as to the bureau matter. One was that the country was flooded with counterfeit securities, Liberty bonds, Federal Reserve notes, and so on. This, the Secretary of the Treasury promptly denied.

Former Director Wilmeth maintained that nothing was radically wrong. He stated that there might have been some errors due to the necessary employment of hundreds of untrained employes during the war, there being at the peak 8,425 men and women in the bureau, and in the rush as many as 600,000 bonds were issued in a day, and the regular work of printing the currency and stamps was kept up.

The matter dragged along with the discharged officials living under the finger of suspicion. Years of faithful service had apparently gone for naught. Dr. E. L. Beach, 68 years old, and for nearly 30 years in the service of the government, *died of a broken heart over the shame of his removal under such conditions.*

In the meantime, as a half-hearted acknowledgment that a wrong had been done, three of the women were put back to work in the Treasury Department *at greatly reduced salaries.* One man was also given a place. The President offered no objection.

Duplicated, Also Skipped

THE Civil Service law provides that the eligibility for reappointment expires, if not reinstated within one year after discharge, unless he be an ex-service man, or was dismissed because of reduction in force. As the time drew near for the expiration of the one-year limit, the matter was again brought to the fore. During all this time investigations and counter-investigations were made. The Department of Justice and the Treasury Department put their best sleuths to work and every activity of the bureau was looked into. Minute examinations were made of every possible avenue of wrongdoing.

Demands began to be made to make public the result of these investigations.

It was reported that about the only thing revealed by the investigation of several months of the records of the bureau, and the examination of the activities of certain individuals, over whom a veil of suspicion was thrown by loosely placed charges in high quarters, was an old story of some minor thefts, which long ago were exposed and the guilty persons punished.

It developed that some bonds did have duplicate numbers, due to the fact that the automatic numbering machines would duplicate, but would then skip, thereby counterbalancing the duplications. It was stated that the President was informed that there was no over-issue of government securities or currency. The complete audits and investigations by the Department of Justice and the Treasury Department failed to disclose a single case of criminality.

It is contended that had the President conferred with Secretary Mellon, under whose jurisdiction the Bureau of Engraving and Printing lies, he would have found that the Treasury Department had a complete check on all bond and currency paper issued, and that it was impossible to issue spurious bonds and currency, because not only was every square inch of paper used in their printing guarded and checked, but the number of bonds and currency per sheet had to be returned, or a spoiled one in its place. This fact, as well as the information conveyed to the President by Secretary Mellon on the final reports made by the Secret Service, showed that the government had not lost a penny by duplication.

A short time ago it was predicted that the withdrawal of the suspicion surrounding the dismissals of the officials would soon be made, and would carry with it a complete vindication of what was regarded as an unjust slaughter of the positions and character of those dismissed, and they would have their Civil Service rights restored "without prejudice."

Those interested in the dismissed officials insisted that they should be restored to the Civil Service, and either to their former places or others equally as remunerative.

As the promised action by the President was not forthcoming, Senator Caraway introduced a resolution in the Senate directing the Committee on the Civil Service of the Senate to hold hearings and report the facts relative to the order of dismissal by the President. It was referred to the Committee to Audit and Control the Contingent Expenses of the Senate.

There are some who feel that the President was imposed upon and made the victim of petty political ambitions of some of the present officials of the Bureau of Engraving and Printing, aided and abetted by those of influence.

There is one name continually mentioned as being at least partly responsible for the whole affair. That is Charles B. Brewer, chief investigator of the Department of Justice. It is alleged that Brewer was made the tool of some of the present officials in the bureau, who showed him some duplicated bonds, and advised him that if the removal of the officials was made at night, with proper investigation following, huge frauds would be revealed.

Claim Brewer Bungled

IT IS also alleged that Brewer bungled his first investigation, or at least was premature in reaching his conclusions, and that President Harding was made a victim of superficial inquiry.

Yet, the President did not consult Secretary Mellon before he issued the order.

It has also been alleged in the press that Brewer was interested in getting the bureau to substitute another system of numbering for bank notes, bonds and other governmental securities.

There was a conference at the White House recently between the President, Secretary Mellon, Attorney-General Daugherty, Under-Secretary Gilbert, Commissioner of the Public Debt Broughton, and Charles B. Brewer. It is understood that Brewer, a personal friend of the Attorney-General, endeavored to prove his allegations of false and irregular numbering of bonds at this meeting, but failed to do so.

It is stated that the former officials of the bureau are demanding that those who furnished the wrong information against them should be dismissed, or prove their charges.

Although it is said that official and definite statements have been made by both the White House and the Treasury Department that the two investigations by the Treasury and the Department of Justice disclosed no signs of graft or conspiracy or dishonesty, it is said that Brewer is still keeping up his efforts to prove something.

The President has specifically stated that no criminality was discovered, and yet 10 months and more have elapsed since the heads of the various bureaus in the huge plant were summarily dismissed, and in the meantime no explanation has been given as to the reason for the action which shook Washington to its foundations and startled the nation.

"Restored," But No Jobs

IN THE words of one of the committee of the discharged officials who visited Secretary Mellon:

"We have walked the streets almost afraid to look our neighbors in the eye because of this cloud of implied disgrace which has been hovering over us since last March. If we are guilty of anything, we wish an opportunity to defend ourselves, and if the evidence given to President Harding, which caused him to make the biggest shake-up in personnel of any government organization that has ever occurred in Washington, was not sufficiently substantial for him to make the explanation which we ask, then it is only just that his informants be dismissed from their tasks, as we were, and we be reinstated."

The President, on the 14th of February, by executive order, restored the Civil Service status of the dismissed employes, except former Director Wilmeth.

This order of the President, it is said by government officials, does not carry with it any probability of reinstatement of the dismissed employes in their former positions, but simply that they may be re-employed, if certified by the Civil Service Commission, to other positions in the government.

Some time later it is reported that the President would make public the details of the matter.

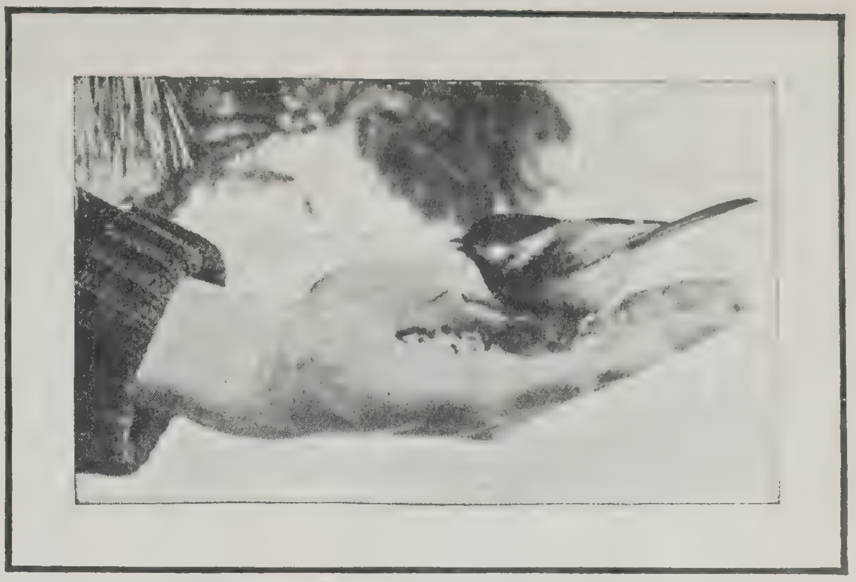
This has not satisfied the friends of the dismissed officials.

They state that the order of the President does not assure the employes that they will be given other places. Nor does it recompense them for a year's idleness and the humiliation they have suffered.

Good Cheer Radiated by Our Winter Birds

Roses in Season of Ice and Snow for Feathered Philosophers

By CARL SCHURZ LOWDEN



The trustful, fluffy little chickadee can be tamed to eat out of one's hand.

STOP a moment to consider our joy-spreading winged neighbors. Have you ever taken thought of the eyes of birds and what they may see? These organs are set in the head at the corners so that each commands two streets with a range of vision exceeding that possessed by humankind. Birds see backward and also forward through a wide angle that approaches the extent of the circle. Only one segment of the entire circumference, that directly in the rear, is a blind spot.

You have heard the common expression, "A little bird told me." No one knows whether that bird was an owl, a chickadee, a titmouse, a woodpecker, sparrow or a brown creeper. Anyhow the phrase originated from Ecclesiastes. It is predicated upon the idea there suggested that the winged wanderer from its vantage above spies upon all strange and obscured knowledge below and reveals it to those who can understand.

Now does somebody want proof that there are roses in winter and that our flying friends see them? I think it is rather sudden, just a bit early in the game to call me. Well, if I must confess I will that "a little bird told me," moreover not one single fellow but several of them probably none single; in fact, I did not ask and they did not tell about the latter point.

But, as I was going to say when the expression business interrupted, consider the defective vision of the genus homo. Look at the spectacles worn, some for style's sake but most of them because they are needed. Even the man with good vision has never beheld certain rays of light, and he cannot see certain material things or minute objects without the aid of a microscope, a contraption at which every respectable bird decisively turns up his beak.

Then, too, there are all sorts and conditions of men. The person with the worst vision sees the empty space and never the doughnut. Every member of the human family hopes he is not this sort, for the individual with that kind of vision misses fully half of life's treasure-trove. The fellow that really lives manages to step outside of himself occasionally and to see beyond, to see the material or corporeal plus something more.

See what the birds see by going out into the woods when winter has bestowed its snow cloak. Climb the old rail fence and jump down on the other side. The noise of the impact may rustle a rabbit out of his hiding place. But don't worry about that. Just depend upon it Br'er will find another, and not go back.

Race your shadow. Catch the stimulating sunshine, and relish the invigorating cold in the air. Breathe deeply. See the doughnuts, and never mind the holes, and just be glad you're alive.

What bird will extend the first greeting? You may be met by a cardinal wearing his cap of jaunty red. If he is frightened he will stammer and stutter in a great way. He will then regard you as an intruder and probably wish for your absence.

Yes, the redbird is rather temperamental. He is also rather proud of himself, for he knows full well the beauty of his red jacket. He also knows that he contributes about the only touch of bright color that the woods has since the autumn leaves faded out of the pre-winter picture. If you are a sweetheart or have a sweetheart you will be a bit self-conscious when the cardinal hails you with "sweet dear, sweet dear." If you believe that prosperity has come back or may be expected within a few months, you will be surprised that the bird holds the same opinion; for his message will seem to be "good year, good year" or "have cheer, have cheer."

I call him the optimist of the woods. If you watch him and learn his habits and character, you will find him as bright in disposition as his brilliant coat.

In captivity the redbird is never himself. I saw 30 males in a cage at a place in Chicago just across the bridge from the Union Depot. Their crests were gone, or nearly so, because they had pressed them again and again against the wire in a mad effort to be free. Their calmness, their inherent majesty, their vivacity had all been left at the old home in the woods. To anybody that knows woodfolk it was evident that the birds were enduring a worse punishment than the man sentenced to be hanged; yet they had committed no offense other than that of being beautiful enough to excite a certain biped's desire for possession.

Out in the woods you may meet first that marvelous fellow, the nuthatch. He has one greeting for all and everybody, and he delivers it nasally or gutturally. "Yank, yank," he says.

He is a jolly good fellow, very sturdy, dependable, persistent. He never seems to fail in getting what he goes after. He also has a good appetite and the cheerful disposition that invariably a well-fed person has.

The nuthatch trots up or down a tree, around or over, underneath, above, at any old angle, but he never tumbles. Any circus ought to be superbly glad to have an acrobat that could even approach this bird's wonderful performances. The nuthatch never had any training. His stunts are utterly natural, just a part of his daily existence.

Why does this bird acrobat furnish a free show to anybody that will look or use a pair of field glasses? It is his way of working for a living. He finds the hibernating insects and larva, and straightway proceeds to dine upon them. He goes where they are. He seeks them out and digs them out in a most zealous but apparently haphazard fashion.

How does he hang on when he is on the under side of a branch that makes a right angle with the body of the tree? A fly can walk across a ceiling because he possesses little suction cups in his feet. The nuthatch could not use any such devices, however, for they are ineffective except on a flat surface. He carries a good supply of hooks with him. As they are extremely sharp and well curved he has no trouble at all to catch them in the bark whenever he wishes to investigate a spot that would be uncomfortable for most of his bird friends.

There are two families of nuthatches, the white breasted and the redbreasted. The white family likes to dwell in the eastern portion of the United States, but the red citizens prefer the northern states and some of them even go so far as to desert Uncle Sam for King George. Their habits are similar. They wear the same uniforms of blue or slate gray and differ only in the decorations on the breast.

Probably every creature, both great and small, quadruped and biped, worm or insect, beast or bird, has some sort of a philosophy of life. The acrobat of the woods has one of his own but, as humans and birds do not speak the same language, it can only be guessed at.

"Keep busy," I think the nuthatch tells us by his manner of living. "Work as I do. Don't grumble or complain or worry."

Only once have I ever seen this fellow worried, and then he was the innocent bystander that the course of events involved in a quarrel between cousins. He practices what he preaches if the world will let him. But on this occasion a hairy woodpecker chose to be the bully over a downy woodpecker who is three inches shorter from the tip of his tail to the tip of his beak. The domineering one chased the other to the tree the white-breasted nuthatch was minutely exploring. The acrobat attempted to avoid the conflict by flying to another tree which happened to be at that time under the scrutiny of a brown creeper, but the fighters followed. Both of the noncombatants were worried, and you would be too if neighbors selected your dooryard as a battleground.

The hairy and downy woodpeckers are not so congenial as they might be. I could wish that the hairy cousin would not terrorize or run over the smaller, but he is precisely like nations have been through the ages; he has power and thinks he must use it.

They are year-round residents. The climate never moves them south or north. They establish homes and stay there. These jolly carpenters drill holes in old stubs and dying trees, qualify as architects by the evident planning of their work, and when the blasts of winter come they hide away.

Probably no birds are as valuable to owners of orchards as these two species of woodpeckers. They search the bark of apple and other fruit trees for the larva of harmful insects. Sometimes they drill into the wood itself to get wood-boring larva. We never see the larva, for the toothsome morsel is swallowed as soon as obtained, but we see the hole and unjustly accuse real friends of damaging our trees. Don't always judge by mere appearances. Is it better to have a tree killed by an enemy inside it or to let the woodpeckers mar the exterior so they may dine on the enemy?

These cheerful cousins, besides rendering a genuine service by hunting down and devouring parasites, give a good example of industrious activity to mankind. They are real workers; if they don't work, they starve. It is not so much a question of sentiment with them as of necessity; yet a student of bird life could scarcely believe that they do not see the roses that winter grows.

If you know these carpenters, you know their garb of black with horizontal stripes of white. No, they are not convicts and they have not broken out of prison. It would be quite unfair to call the downy a jailbird, but the term is applicable to his cousin who runs over the smaller in a ruthless manner; indeed, the hairy woodpecker may be the original jailbird, but he would doubtless strenuously deny the imputation if you asked him.

The hairy woodpecker and the brown creeper may be rightly regarded as the two extremes of our feathered residents who brave the severity of winter. The creeper clings close to the tree bark. He is inconspicuous, for the color of his coat blends with the background. This fortunate fact forms his only defense against attack. No one could ever say that he is boisterous, domineering, or ever a bully.

(Concluded on page 14)

Above—Some thoughtful person attached a piece of suet and a sunflower seed ball to the limb of a tree with the result that one of the downy woodpecker tribe found the suet and an acrobatic nuthatch discovered the seeds. At left—The downy woodpecker qualifies as an energetic driller at mealtime which is all the time except that used for sleeping. At right—The white-breasted nuthatch is the acrobat of the woods.

Yes, Sir! Huck Finn and Tom Sawyer Still Live

Concluded from page 3

it seems she has been made famous, and she speaks of it all in rippling, almost bashful tones.

"No, he didn't tell me," she smiled, "he never said a thing about putting me in a book. He was always doing something unusual. But I don't know any new stories to tell about him—I've told all I knew long ago and I can't invent them as well as he did.

"Oh, we used to be together—we were in school and neighbors, and we were at parties and went skating. We used to go skating on the creek where the railroad runs now. In those days we had to amuse ourselves, we didn't have any movies, and yet we were happy. Once or twice I remember going to St. Louis but that was a rare event—we went on sleigh rides—on the ice when the river was frozen, out in the country.

"In the summer time there were picnics—we used to picnic down near the cave and all of us would go in together."

"Then you and Mark were never lost inside?"

"No, that's just a story—Mr. Clemens was writing fiction and he couldn't use all the truth or it wouldn't have been so good. He told me that when he came back in later days.

"Oh, it was a different country than it is now—all the houses were log cabins and the clearings were few —the forests were all about. I remember the first railroad—we all went on a picnic. They took us on flat cars decorated with vines, out to the end of the track where we had a barbecue for part of the celebration. We never danced the waltz in those days—always the quadrille or Virginia reel, or games like Dusty Miller. That was quite a while ago."

And when she held out her hands I noticed that they were small and scarcely wrinkled at all—she has preserved the delicacy of her childhood in old age. Or perhaps it is the magic influence of Becky Thatcher which keeps her so young.

"John RoBards went to school with us, too—he lives in town," she added, as I moved away. That made me anxious to meet another one of those living book characters; yet it is hard, for after considering them boys and girls to find them old men and women is startling.

Colonel RoBards keeps a law office on Main street —such a law office as one may read about frequently but never see. In it are the collections of old documents, old cases which he pleaded and above all the Colonel himself. He is a regular colonel, erect, white-haired, genuinely hospitable in all the dignity of his position —a man of the old school and very proud. When he walks he carries a heavy, exquisitely carved cane brought to him from Mexico and with every step he commands respect.

He is the boy "who always won the good-conduct medal and would one day make all the other boys jealous by riding away to California with his father, his curls of gold blowing in the wind." He was the youngest forty-niner, for he was only nine years old, yet he carried strapped across his chest a heavy double-barreled duelling pistol. It was a large weapon for so small a lad but it gave him tremendous assurance and he treasures it among his keepsakes. His father kept the mill, he knew Mark as one boy knows another in a small village and, whether of his own volition or not, both he and Mark were whipped for a similar offense. They grew tired of continually wearing the same medals and one day effected a trade. It might have been at recess or at noon—and then both entered the schoolroom, the one proud and happily unconscious of impending doom, the other half expecting the knell of doom. So substantial was the punishment that neither ever cared to trade afterward—their boyish fervor had been abruptly checked.

But John RoBards does not speak of Mark Twain alone—he has collected during his life stories of Constantine, of the war, of the Revolution and of Negroes. He tells the stories over and over interspersing them with incidents of Mark Twain, but unlike many storytellers he adds additional seasoning to the second telling.

Yet one more portion of Mark Twain's life remains to be explored—the cave two miles south of town, its opening beneath a sycamore now fenced with a wooden gate to prevent would-be explorers becoming lost. Discovered a hundred years ago, the cave has not yet been totally explored—its recesses and caverns, alcoves and corridors are innumerable. But a guide is provided who enjoys pointing out the interesting portions, and who has taken so many through that the trail shows clearly by the drippings from the candles. There are Adam's footprints in the roof walking toward the entrances, farther on are Eve's footprints following those of Adam as in the old days (and even then she wore high-heeled shoes); and the guide will stop at the cove of Jesse James' ghost which returned to this retreat after Jesse James was shot. He indicates the parlor with its settee and piano, the keel and prow of a ship, the cross on the ceiling beneath which the treasure was supposed to be buried and the five corridors coming together which Tom Sawyer explored that day he was lost with Becky Thatcher.

Around the cross lingers the ghost of Indian Joe—ever anxious, ever curious, drifting by in the damp atmosphere, and peeking over your shoulder as you go. He is intent, that ghost, but stolid for all that—he stopped just behind me when I paused for a flashlight and as a result his shadow was caught on the plate. I did not know he was there—all was dark and poorly lighted by the lantern glow—he came up very quietly and I doubt whether he understands the intricacies and abruptness of flashlights. He is stolid though, for not a wrinkle of his stony sphynx-like features moved at the explosion. I know he was there —no one else ever saw him but he is part of the picture. Perhaps if anyone cared to walk through the corridors at midnight both Indian Joe and Jesse James might appear—no better atmosphere could be found for a seance. The high dark, cavern roofs, the shifting, moving shadows, the silhouettes which quiver back and forth—no wonder the cave became the rendezvous for Tom Sawyer and Mark Twain and no wonder that in it they could so bravely prick a finger to write their name in blood below the oath of allegiance to the gang.

It was twilight when we returned to the entrance —twilight which reached Cave Hollow and settled too upon that bronze facsimile of the great author which stands in the park on the river three miles from the cave. The statue has a good place, a great vista lays before it—a panorama dotted with islands known so well by Mark Twain, the Mississippi far below the bluff rolling along endlessly, incapable of appreciating human life, with bottomlands turning color through the seasons and with long lanes of woodlands whispering exotic thought from day to day. Mark Twain has been placed where he may see all that, where he may paint it again with his pencil, but I wonder if he does not leave the bronze cast at night to revisit the cave and its weird ghosts.

And perhaps he meets there, at midnight rendezvous, Tom Sawyer and Huck Finn for a talk of the old times when they were boys of the gang and members of the "Black Avengers of the Spanish Main."

The Rip-Van-Winkling of Arkansas' Ozarks

Concluded from page 7

tems; movies and movie fans; boost-your-home-town commercial clubs; filling stations and soda fountain vamps; municipal uplift leagues and keep-on-the-walk signs, yet they are not the rule by which one may measure the progressiveness of the Ozark world, but using the true rule, there is certain evidence that the people have waked up and moved forward. The country folk now have their fruit growers' associations; their daily organizations, farmers' institutes, co-operative marketing organizations, co-operative stores, they have their county agents to help solve problems and show the modern ways; they order fertilizer by the carload; they are building up the quality of their live stock; the boys have their pig clubs and the girls their poultry clubs. They all enjoy telephone and rural mail service; many have their daily paper besides fruit and farm weeklies and magazines for general entertainment, to say nothing of phonographs with jazz records. Here and there log houses of many years standing are still doing duty in providing family shelter, but nearer the towns and along the improved highways, they have been replaced by new houses equipped with modern conveniences that bespeak progress and prosperity and add greatly to the community appearance, and last but not least, while occasionally there may be seen a family going out for a joy ride in the sturdy farm wagon to which is attached, by means of a chain harness, a one-eyed mule and a roan pony, the gasoline car is now the general conveyance that whirls the Ozaakian ruralities over the nice roads into town or to the river for fish.

There are certain lines along which the Ozark country should be developed, and this the residents seem to realize. The natural producing tendencies of the country lend themselves most favorably to the fruit and dairy industries and these are being generally encouraged by farsighted leaders. The Ozark territory is the best natural fruit country in the United States. More fruit grows wild there than grows in many other sections with a great deal of petting. Not only does it produce abundantly but the flavor of the fruit is unsurpassed. Even a Ben Davis apple grown in the Ozarks is good. Already the northwest county of Arkansas ships more apples than any county in the United States, while the largest peach orchard in the world is in Arkansas, and grapes in the Arkansas Ozarks are coming to be a commercial crop of prime importance, and a nationally known grape juice company is now building a factory in the northwest corner of the state to take care of the increasing tonnage. Each year the fruit area is augmented by hundreds of acres by both individuals and companies, and with this rapid development, the Ozark country can soon supply all her sister states with delicious fruit and it can furnish the cream to pour over it, for with the building up of the present herds to a high dairy standard, the cream export will be increased a hundredfold. The Ozarkian in the past was content with a poor grade of cows but by reading his papers and hearing lectures and being preached to by his county agent, he is coming to see that the high-grade cow is the one with dollars in her cream, just as others who make fruit a specialty learned that for the best results they must fertilize and prune and spray and smudge and do all those things which scientific study has shown will produce the greatest quantity consistent with perfection of quality.

While the possibilities of the fruit and dairy industries in the Ozarks are known quantities and their development, great as it promises to be, can be fairly well estimated, the mind of the Ozarkian, as well as that of many outsiders, is just now entirely taken up with speculation about that magic product which, when found, never fails to stampede the modern millions—that precious greasy stuff, oil. To every known scientific test for oil, the Arkansas Ozarks have responded in many places, and both local and outside capital is now engaged in putting down wells, some of which may any day burst into production that will put the northern part of the state on a rival basis with the southern part, and that has been a wonder in oil production in the past 18 months. When the oil drama is put on the Ozark stage, the world will attend the performance, and what prejudice remains will then be forgotten and what backwardness in the natives remains will be swept aside in the overwhelming modernity of oil.

Nowhere in America is there the wonderful natural supply of water that is found in the Ozarks. Thousands of springs bubble or burst, according to their volume, from the rocky mountain sides; scores having remarkable medicinal qualities. The day of the Ozarks is at hand. Until lately their citizenry has drowsed through life much as an old man sits in the warm spring sunshine, half asleep and half dreaming of the past while all about him is life springing into action and fruitfulness, but the reborn Ozark natives have turned their minds from the past. They have been old but in the fullness of their time, youth has come upon them and, as is the way of youth, they are facing toward the future hopefully, eagerly and not without reason for they are in the bright morning of their Day.

Good Cheer Radiated by Our Winter Birds

Concluded from page 13

The creeper rarely rests. He spends his life incessantly searching the trunks of trees for his food which consists of minute insects and their eggs that larger birds miss. On his bill of fare you will not be able to find any product of the farm or any useful insect, and this is a distinction which few birds may properly claim. He possesses amazingly strong claws and is remarkably sharp-eyed.

You may watch the brown creeper from dawn till dark without catching him in a violation of his working system. He starts low on a tree trunk, spirals upward in imitation of a corkscrew, then suddenly flies to the base of a neighbor tree and repeats the process. Draw a diagram of his course; you will find that he makes just one N after another. He never climbs down a tree and he never starts his meticulous exploration at a point above the middle of a tree. This bird certainly has an individuality all his own; from my own observation I would say that he is an absolutely consistent performer.

If you are unacquainted with the creeper but desire an introduction, do not be readily discouraged by failure to find him. His inconspicuousness is his one protective device; yet he must need others or a greater hardiness for his tribe seems to be decreasing year by year. The best way to meet the creeper is to form the habit of looking at every tree trunk you pass, and some day you will happen upon him assiduously working at his specialties of bark inspecting, spiraling and N-making. The odd little fellow minds his own business.

Another admirable little fellow is a bird that sings his own name. He will not let you forget it, but he does the song so cheerily that you forgive the egotism he exhibits. He simply bubbles over with good nature and the joy of living. Whenever you become touchy and out of sorts, just visit Dr. Chickadee, the physician that uses no drugs.

He wears a black cap and a gray suit. You can never surprise him without his white collar for he never takes it off or even soils it, nor could you discover him with his gay disposition discarded. He keeps that on just as faithfully as his black cap, white collar and gray suit.

With the possible exception of the chipping sparrow, the tiny chickadee is the most easily approached of all our bird citizens. The person with real patience and an adaptability for bird friendships can soon get on good terms with him; after a time he may even be induced to alight upon one's hand and to feed therefrom. Can you wonder that he is one of the favored pets of bird lovers?

Like the brown creeper he is a bark inspector. Like the nuthatch he is a gymnast often hanging from a twig trapeze. Like the woodpeckers he nests in a hole in a tree, usually one made by them and abandoned. He possesses the vivacity and general cheeriness of the colorful cardinal. In comparing him with the other winter residents it becomes evident that his popularity results from the combination of many good qualities in one fluffy body. He is the "E Pluribus Unum" of birds.

Poets love the chickadee. Indeed, who does not? Emerson, the poet-sage of Concord, met the cheery sprite one January day of 1862 when the country was divided and warring. The strife had not affected the black cap's disposition, for he extended a glad greeting to the verse writer walking in the wintry snow-choked woods. Here, in the poet's own words, is the story of the delightful encounter:

"Softly, but this way fate was pointing,
'Twas coming fast to such annointing,
When piped a tiny voice hard by,
Gay and polite, a cheerful cry,
'Chic-chic-a-dee-dee!' saucy note
Out of sound heart and merry throat,
As if it said, 'Good day, good sir!
Fine afternoon, old passenger!
Happy to meet you in these places
Where January brings few faces.'"

International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

In the Shadow of Immortality

ACVAGHOSHA, the great philosopher of Ancient India, in his discourse on "The Awakening of Faith" said, "All things in their ultimate nature are perfect and complete, and not subject to destruction.—Matter and mind from the very beginning are not a duality. So we speak of the universe as a system of rationality, seeing that the real nature of matter just constitutes the norm of mind. Again we speak of the universe as a system of materiality, seeing that the true nature of mind just constitutes the norm of matter."

The great Japanese scholar, Teitaro Suzuki, who first translated the Acvaghosha monograph from the Chinese version of the lost Sanskrit original, states that Acvaghosha "lived at the time extending from the latter half of the first century before Christ to about 50 or 80 A. D.

At the present time modern science, by its careful and laborious methods, is arriving at the same conclusions which were reached 2,000 years ago, without the aid of scientific instruments of observation, by the great Indian seer Acvaghosha. The broad insight of this Indian thinker was extraordinary. In his monograph he considered the ultra-modern subject of "Relativity" and the writer is practically certain that Acvaghosha was the first to discuss this much mooted question under the caption popularized by Einstein. It is worthy of note that Acvaghosha concludes that "enlightenment is absolutely unobtainable by any modes of *relativity.*"

In view of the reflections of this ancient philosopher it is particularly interesting to consider the work and conclusions of the modern men of science on this subject of the unending nature of ultimate existence.

At the present time the sharp demarcation between the inorganic and the organic world is disappearing. The theory that the ultimate particles of which matter is composed are indestructible has been established for a long period of time. The elusive problem of *life* has persistently baffled investigators. Within recent years, however, important light has been shed on the problem with the result that we are now certain that the inorganic and organic ultimates have more in common than has heretofore been supposed. The epoch-making contributions of Dr. Alexis Carrel, the American, and Dr. Sir Jagadish Chandra Bose, of Calcutta, India, are responsible, in a great measure, for the partial reduction of the gap between the inorganic and the organic world, between atomic matter and cellular life.

The achievement of another American, Dr. Ross G. Harrison, in showing that it was possible, outside of the body, to grow sections of animal tissue, formed the basis of Dr. Carrel's bold departure. In his revolutionary investigation Carrel was ably assisted by Dr. Montrose T. Burrows.

All living organisms are composed of cells. A typical cell is indicative of a particular type of organism much in the same way that a certain molecule indicates a definite kind of matter. Dr. Carrel realized that fundamental knowledge must be gained by observing the behavior of the typical cells which composed the various organisms. The very first requisite for this study of cellular activity outside of the organism is a nutritious environment as closely reproducing the conditions of its native organic environment as scientific ingenuity will permit. The temperature of the human body is about 38 degrees Centigrade. An incubator can continuously maintain this temperature. A nutritious environment is available in the form of ordinary blood-plasma. Into such an environment Dr. Carrel placed cells removed from such organs as the heart, liver and kidney. Cellular groups from cartilages and bones were also introduced into this artificial environment. After periods varying from a few hours to a few days these cellular groups began to show extraordinary activity and growth. In some cases the growth was so marked that it could be observed without the aid of a microscope. The cells, contrary to all previous expectations, did not die when severed from their parent organism but flourished and developed in a most remarkable manner. Another startling fact was revealed that each typical cell group continued to function and behave in the same manner in its artificial environment as in its original organic surroundings. A small fragment of a chicken heart was observed by Dr. Carrel to contract and expand in regular pulsations in the same manner as the organ from which these cells were taken. When the pulsations became less frequent the vigor of this fragmentary heart was restored by washing and providing new nourishment of fresh blood-plasma.

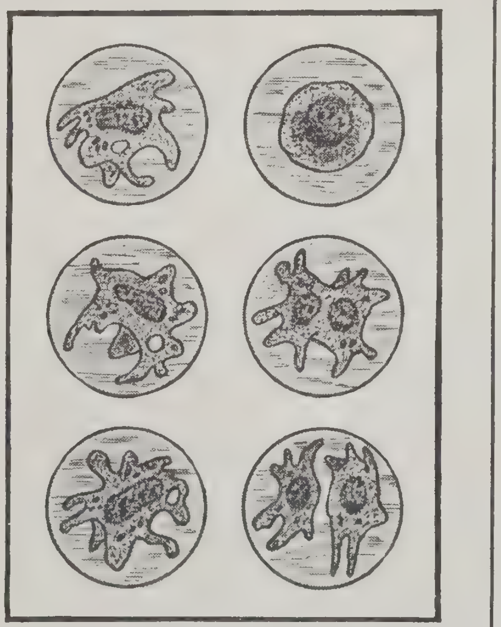
DR. ALEXIS CARREL,

Nobel Prize Winner in medicine, whose researches seem to indicate that the protoplasmic cell is an immortal entity.

What can "death" mean in the light of these discoveries? If a man is killed in a railroad accident is that the absolute extinction and the final end of his existence? The body, as a directed organism, ceases to function but the cell groups which constitute this organism continue to behave in their respective and characteristic ways for a considerable time after the body has ceased to respond to conscious desire. The bodily cells if removed into a suitable environment may be made to live indefinitely. Tissues may be preserved for periods of time by temporarily suspending their activity in cold storage after which animation may be re-established in a warm and nourishing environment. These facts actually extract the "definiteness" out of "death." Years ago "death" was considered as one of the absolute certainties in the cosmos. Now we must place restrictions upon this word if we wish to be truthful and exact in our statements. We can speak of a man as having died within the last 10 minutes but we cannot include the entire cellular organization of his body in that assertion. It is now conceivable that some of the cellular groups of a "dead" man's body may be transplanted into a new environment with hopes of an uninterrupted continuation of their own particular life. It is a well-known fact that such elementary organisms as the amoeba never die. The amoeba knows neither birth nor death. There is multiplication, however, but this consists merely in the splitting of the nucleus of the amoeba thus producing two separate amoebas which thenceforth lead independent lives. The nucleus of a cell constitutes the vital portion, and it is the center of control of all the activity of a cell. Growth, development and the transmission of characteristic cell qualities depend upon and are due to the nucleus. The really vital portion of a cell-nucleus represents probably only about one-tenth of the entire weight of the nucleus which, in turn, only weighs about one-thousandth of the total cell weight.

If the essentially vital portions of the human body could be assembled, this aggregate would weigh only about one-fifth of an ounce and this directive vital system or *"primary body"* would be invisible. The recent careful research work of Dr. Hippolyte Baraduc, Professor Charles Richet, Mme. Bisson and Dr. Von Schrenck Notzing, conclusively indicates that the phenomenon of death consists of a separation or departure of the *primary body* from the "secondary" or physical body. The terms "primary" and "secondary body" have been introduced by the writer.

Now we know that the human body, in dying, gives up an emanation, a *primary body,* in a manner very similar to the "dying" phenomenon of radium during which emanations or rays are discharged until active radium has been transformed into a more passive element.



Left column—Three changes of shape of amoeba while floating in a drop of water. Right column—Top figure shows solidification of amoeba when touched. Two lower figures show one amoeba splitting into two live amoebas.

We also know, through the experiments of Dr. Carrel, that cellular tissues, after removal from the parent organism, may be indefinitely rejuvenated by successive immersions in new nourishing environments. Dr. Carrel has, in that manner, caused cellular tissues to pass through a hundred life-cycles without any visible token of the approach of an end to the series. In fact, the reverse seems to be true, many of these cell groups are more vigorous in their behavior at the end of the hundredth cycle of rejuvenation than at the end of the first few cycles of the process.

Do not these startling scientific facts indicate that we now stand in the very shadow of immortality? Do not these indisputable indications point to a scientific proof of the postulate of faith, that death does not end all?

Acvaghosha, and not Haeckel, the mechanistic materialist, is correct. The sage of Ancient India, unaided by the methods of science, saw more clearly into the verities of the cosmos than the self-satisfied mechanistic materialists of modern times. Science has turned the tables of materialistic positivism and matter has become dematerialized into energy, and cosmic things have unfolded into beings whose essence is spiritual.

The investigations of Drs. Carrel, Baraduc, Richet, Von Schrenck Notzing and Mme. Bisson have cast new light upon the problems of life and death. The great cosmic panorama reveals nothing but transformation and change from one state of existence to another without loss of essential characteristics or properties. The "character" and "personality" of a cell persists without change throughout a long, and perhaps unending, series of life-cycles. This is the general law of all being and existence. It is true of the protoplasmic cell, the amoeba, and the ultimate primordial material particle. Is it probable, then, that this *universal law of existence* fails in the case of man? Does the essence of man, his "character" or "personality" disappear with the death of the "secondary" or physical body? The experiments of Baraduc show conclusively that a *primary* body is released from the physical body at the time of death. If we assume that this *directive system,* the primary body, retains its "character" after the death transformation, do we thereby violate the *universal law of existence?* We are constrained to answer this question in the negative.

BRIEFLY TOLD

France has but 2,500 movie theaters.

Five French airplanes will soon leave for a trip around the world. The long journey will be divided into a series of short flights. The course will be through Italy, Algeria, Egypt, Syria, Mesopotamia, Persia, India, Siam, Indo-China, Korea, Japan and the United States. From the United States they will fly south to South America, crossing back East to Africa and returning to France by way of Spain.

The play "William Tell" is being produced on every stage available throughout the occupied area of Germany to stiffen the passive resistance of the people to the French.

Gold Star mothers of America, with Mrs. Ben S. Boyd, of Knoxville, Tennessee, as leader, are rallying to prevent another world war. Mrs. Boyd said, "Enough hearts and homes have been broken. We felt it was a privilege to give our sons for a great cause. But if the peace they won is not lasting then we feel that our sacrifice was in vain."

Kansas saves $200,000 in a year by printing its own school textbooks.

The pastor of the Plymouth Congregational Church of Oakland, California, has handed in his resignation, saying, "The church has been outstripped by other agencies in serving mankind and therefore is a failure. In every walk of life, the crying need of people is co-operation, so why shouldn't the churches combine to give co-operation? What difference does it make how man was created?"

The largest and most up-to-date railroad terminal in the world will replace the old burned Dearborn Station of Chicago, if the seven roads now using the station can obtain the support of two or more additional lines for plans already drawn.

Two million nine hundred thousand persons in Great Britain are drawing disability allowances, costing $160 a head.

An unfamiliar flax disease is attacking the stem and leaves of the growing flax plant of the upper Mississippi Valley. It retards the development of the seed and injures the stem for fiber purposes. Investigations are being carried on to find an effective control measure.

The life of an English bank note is about two months. When the Bank of England receives a note back from circulation, it is automatically canceled by having the signature of the cashier torn off.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A fuel-oil skimming device to keep Baltimore Harbor free from floating oil, which is a fire menace, consists of a suction pump on a scow. Oil and water are pumped aboard and the oil separated and barreled. The suction apparatus operates just below the surface of the water.

The Hindus have in their Huli, which terminates with the 31st of March, a festival which has the same aim as our "First of April" (April Fool's Day). Persons are sent with messages to individuals, who died some time before, or to others who are known to be not home. The senders then enjoy the laugh at their disappointment. The First of April custom is of very early origin and is spread all over the world.

A woman steeplejack in California, as her husband's partner, does her full share of perilous work.

The republican government of Bavaria has made a financial settlement on the Wittelsbach family. The Diet has awarded to the Wittelsbachs seven castles, 25,000 acres of land and a number of houses in Munich, a theater in Munich and 60,000,000 marks in cash.

The highest capacity power cable in the world was stretched under San Francisco Bay recently. It covers a distance of eight miles from the shore of Richmond to Pier 41.

A monkey belonging to a family living in the fashionable Quai D'Orsay, Paris, trapped a burglar. When the burglar entered a clothes closet the monkey locked the door and when the owner returned home the monkey proudly turned the prisoner over to him.

Italian immigrants aboard the steamer *Italia* have been refused permission to land at Melbourne, Australia, because there is no work.

Copper is more valuable than gold from a standard of usefulness. Gold is heavy, soft, of low tensile strength, high electrical resistance, low heat conductivity. Copper is employed in so many uses that if it should fail, civilization would halt its onward march until some substitute could be produced.

The unexplored portion of Ontario, known as the district of Patricia, will yield fortunes to adventurous prospectors, according to a representative of a Winnipeg syndicate.

Long Beach, California, life savers send up a smoke bomb when about to make a rescue, and need assistance. It has been proved that a boat can approach a bather in distress more safely and rapidly from the seaside than if it were to start from shore through the breakers. The smoke bomb is the signal for the boat to leave immediately for the scene.

India, including Burma, has an area half as large as that of the United States. Its population is three times as great.

The owner of every radio receiving set in Great Britain must pay $2.20 a year license fee. At present there are but four broadcasting stations in the United Kingdom. They are located at London, Birmingham, Newcastle and Manchester. It is illegal to remove receiving sets from one point to another.

To avoid traffic accidents on the Pacific Ocean, steamship companies will soon have to "double track" the ocean, according to the hydrographic office of the United States Navy. Shipping on the Pacific has increased greatly during the last few years and it is hoped the steamship companies will enter into an agreement to follow definite routes, instead of going in any direction as at present.

The Ruhr Valley produces 68.9 per cent of Germany's coal, and 66 per cent of her steel.

GETTING AT THE HEART OF THINGS

Busy men and women today have not time to wade through pages of advertising and meaningless word-phrases to learn what the world is thinking and doing.

They Want to Get at the Heart of Things Quickly.

That is why so many professional men and women and business executives subscribe to THE DEARBORN INDEPENDENT. It prints plain facts, thought-provoking statements and gives a comprehensive outline of world events. THE DEARBORN INDEPENDENT states the problems: its readers are competent to draw proper conclusions.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

Ten Per Cent Interest Hits Western Farmers, Brings Mortgages and Ruin in Its Wake

Plenty of Funds for the War Sufferers of Europe, But There Is Neither Money Nor Interest for the American Victims of Usury and Cheating

By A FARMER'S WIFE

> ***This true account of conditions, written by a woman who not only knows "but can tell what she knows," is another angle of the devastation which anti-American finance is causing in the land.***

RAISING food for a livelihood is a bigger gamble than playing poker or betting on the races.

It is said that farmers lack business ability. Perhaps they do, but no one can make two and two equal more than four.

The Captain of Industry has not yet been born who can make money selling wheat at 80 cents a bushel which cost him a dollar to raise; or selling cattle for $75 a head when they have cost him $85.

When prices are low, farmers are forced to borrow money, because farming is now a business that uses money, and the interest eats up all the profits when prices are high.

Senator LaFollette, in one of his campaign speeches, said he was sorry for the people in a certain western state as he understood that 49 per cent of the ranches there were mortgaged. That is a very conservative estimate, as a state in the Northwest that does not have more than half the ranches mortgaged may be said to be lucky. *In addition to the mortgages that are recorded,* banks frequently hold ranchers' notes to the full value of all their possessions. These are drawn for 60 or 90 days, or six months at the longest *and draw 10 per cent interest which is added to the principal when they are renewed,* as they invariably are, for farmers have little or no money to pay debts except in the fall, when they sell their crops and cattle.

There Are Too Many Banks

NOW there may be men who can borrow money at 10 per cent interest, compounded semi-annually or oftener, and make a howling success of their business, but they are scarce as hens' teeth.

The uninitiated will say, "Why borrow, then? The man who lives within his means is never hurt by high interest rates."

But how can a farmer regulate his expenditures according to his income when he does not know what his income will be? Even if his seeding in the fall or spring results in a good crop, prices may be so low at harvest time that he virtually makes nothing. Besides he has many necessary expenses that must be met. If he uses horses, they must be fed through the winter so they will be in condition for work in the spring. Machinery wears out and must be replaced. Fences must be built, stock losses replaced. There are always a thousand and one uses for ready cash on a ranch where it is generally a scarce article.

Bankers of the Northwest say that they cannot meet their expenses *unless they give short-term notes and ask 10 per cent interest.* Judging from the number of banks there, in proportion to the population, this statement is probably true. *But what is the necessity of so many banks?*

In pre-Prohibition days, saloon licenses were granted in proportion to the population. *It might be well to adopt some such legislation to protect the rural communities from too many banks.*

In a certain locality that used to be famed as an agricultural paradise because of its fertile soil, rich pasture land and prosperous people, the chief town had a population of 2,000, and supported two banks. Now, the town has grown to 6,000 and boasts four banks, while, within a radius of 30 miles of it, are four more banks, and about 2,000 more persons, counting women and children.

Prosperity Has Gone

CONSIDERING that some of these financial institutions pay their officials up to $7,000 or $8,000 a year, it undoubtedly requires a high rate of interest for so few customers to pay the salaries of so many bank officers and clerks, not to mention the 10 per cent interest expected by the stockholders.

Needless to say, prosperity has fled from that vicinity.

My sympathies used to be aroused for the poor victims of Jewish persecutions in Russia until I learned that the dreadful anti-Semitic outbreaks were merely a manifestation of the rage of an exasperated peasantry when they saw their means of livelihood taken away by the greedy money lenders. A man can be forgiven almost any crime when he works hard, 16 hours a day, to pay his debts, then, owing to crop failure and usurious interest, he fails to meet his obligations, and sees his last cow led away, while his hungry little children are crying for milk.

It is strange how few people realize that ruining the farmer means ruining the country, as agriculture is not AN industry, but THE INDUSTRY of the human race. It is a pivotal occupation upon which everyone really depends for a livelihood. A man must eat to live, and where will he get food, if there are no farmers?

It is an indisputable fact, that farmers are not given a square deal by their selfish, thoughtless city cousins.

For instance, not long ago, a representative of one of the smaller packing houses went about among the homesteaders and poorer ranchers and offered to buy their stuff, ship it, and pay the market price the day the beasts arrived at his stockyards.

Now farmers' brains are not usually provided with as many crooked convolutions as that of the average pickpocket, consequently they are "easy marks." The poor men approached by the packing house representative thought his offer was an opportunity to be grasped quickly, as few of them had even one carload of cattle, which necessitated several of them clubbing together to ship, not to mention that cars were almost unobtainable at times; so they let the benevolent agent drive off their stock. The day the cattle reached the stockyards, the market ranged from three to seven cents a pound, and these ranchers, irrespective of the condition of their beasts, received three cents a pound.

They would not have made any profit this year at seven cents a pound, but three cents was a regular holdup for anything like a good steer. In fact, any four-year-olds must have cost their owners from 10 to 15 cents a pound to raise them, as they had to go through the terrible winter that followed the awful drought of 1919. That season ruined many of the ranchers and cattlemen in the Northwest, *and yet, at that time, city people were sending thousands and thousands of dollars to help war sufferers in Europe, without a thought of aiding their drought-stricken neighbors at home.*

What a Drought Did

THE victims of a volcanic eruption or a flood are pitied and assisted because they are overwhelmed by natural forces that no human being can control; but what about the farmer who is brought to penury by drought or hail? Does anyone ever spend time or eloquence procuring aid for the victims of drought or hail? And of all natural calamities, drought is the worst. Yet during the awful drought of 1919 in the Northwest, townspeople not only showed little sympathy with their country cousins but improved their opportunities to plunder them.

That spring, the winter wheat came up as usual, its fresh, bright green gladdening the eyes after the barrenness of the cold months just passed. There had been little snow, therefore not enough moisture to make good pasture, but everyone was hoping for the spring rains which—did not come.

The fields of grain faded from bright green to a sickly yellow, and by the middle of July, everyone had given up all hopes of a crop. The weather was blazing hot, night and day, and reminded one of the ancient curse—"Thy heaven that is over thy head shall be brass, and the earth that is under thee shall be iron."

The pasture was already eaten down to almost nothing, and clouds of dust arose from the range as the poor animals traveled around from one place to another trying to find something to eat.

Many ranchers decided to sell their cattle but owing to the delay in getting stock cars the starving animals decreased in value to such an extent that their owners lost large amounts of money.

Some cattlemen tried to rent pasture in other states; but they, too, were unable to get transportation, so suffered heavy losses.

Then the price of hay began to soar, and the hay and feed merchants in town bought new automobiles that year. *Forty dollars a ton for hay as coarse as rushes,* and filled with all kinds of weeds, thistles, cattails and brambles; occasionally one found pressed snakes and frogs in the bales. The starving cattle would eat the miserable fodder, but could not live on it, so owners who could borrow enough money gave every head of stock a measure of grain every day to keep the life in their bony bodies through that terrible winter that began in October and did not really end until May. *It was estimated that the upkeep of every work horse brought through in condition for work in the spring cost $75.*

The poorer ranchers who lacked cash and credit had simply to watch their horses and cattle starve to death.

The cattle would just fall from weakness, and die quietly, usually on the range out of sight and sound, but the horses hung around near home, having faith until the very last that their masters would give them a feed. A horse stands up until he is a living skeleton, one can almost see through him, then, when his weak legs will uphold him no longer, he sinks to the earth but keeps his head up, still watching, waiting, hoping for the help that does not come. At last, the head sinks down on the ground, too, the legs stretch out, the large, patient eyes close, a shudder, and the poor brute has ceased to suffer. Sometimes, though, a horse with uncommon vitality even after he is "down" will make such terrific efforts to stand up that he thrashes his eyes out of his head before the end comes. Many of the ranchers shot their horses rather than have their feelings harrowed by the sight of their dumb suffering.

The long and cruel winter ended at last, and then began the struggle to get in a crop. Wheat was still high, and, as the snow had been about a foot deep on the level for about five months, there was no lack of moisture in the ground. Conditions, though, were so terrible that the townspeople began to realize that the dire poverty of their country cousins might affect them, so efforts were made by the county officials to help the ranchers get seed.

And Then Price Went Down

ALTHOUGH deprived of comforts, and even of necessities during the past winter, the farmers put their shoulders to the wheel and struggled, desperately, to get in a crop. But—they thresh late in the Northwest, *and some of them did not get their wheat in the elevators before the price went down with a rush.*

Few city people appear to realize the time, labor and hard cash used by the farmer in raising his produce.

"Well, how are things getting along at the ranch?" asked a society leader of a country acquaintance.

"About as well as can be expected as long as we have to feed you city people for nothing," was the tart rejoinder of the ranchwoman who had just left 10 pounds of butter at the store and received credit for only nine. Butter put up in pound packages, unless used immediately, loses weight by evaporation, and this woman afterward discovered a defect in her mold that accounted for the rest of the shortage. The storekeeper, however, undoubtedly got the price for a full pound for each package, and thereby made a pound on the countrywoman—clear gain. He did not give her cash but credit, and five cents less than the market price for handling it at all. The rancher is also docked five cents a dozen on eggs, and cannot get cash for them either unless he can ship by the case, and few small farmers have enough hens to enable them to sell 30 dozen at a time, so he has to trade out his butter and eggs and the townsman makes a profit both ways.

If the town butcher buys a steer from a neighboring rancher, he expects to get it at the market price. All the cattleman makes by selling at the home market is the amount of the freight to Chicago or Omaha. The local butcher buys at seven cents on the hoof, and sells the cheapest cuts for 14 cents. Of course, a steer dresses down 40 per cent of its weight, but then the hide and by-products are worth something, not to mention that the butcher sells the choice cuts from 20 to 35 cents a pound.

How Ranchers Are Docked

FLOUR mills and elevators are usually operated by the same companies, but although the wheat may not go more than 20 miles to be ground into flour, the ranchers are docked the freight to Minneapolis on every bushel they sell.

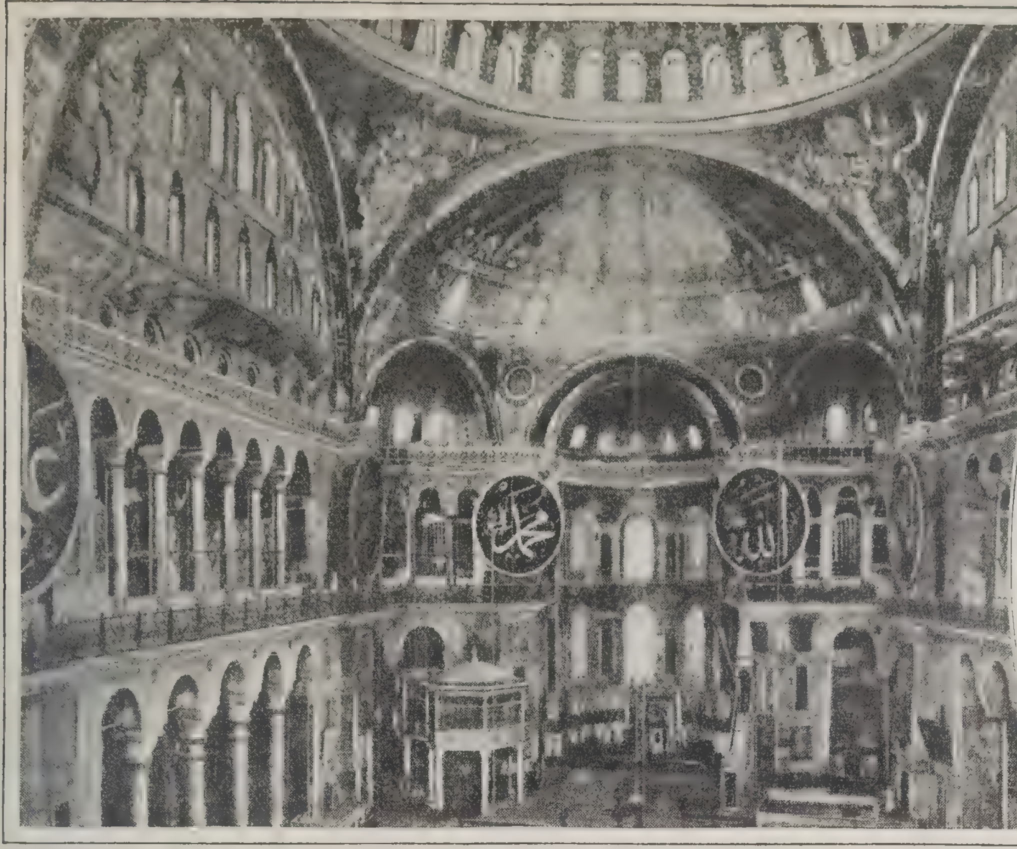
Self-respecting American farmers are the pluckiest men on earth; not only their occupation, but they, themselves, are the backbone of the nation, but the most magnificent courage and splendid manliness can be sufficiently handicapped to insure defeat. The most honest are usually the worst beaten in a crooked game, and everyone must suffer if the farmers do not get a square deal.

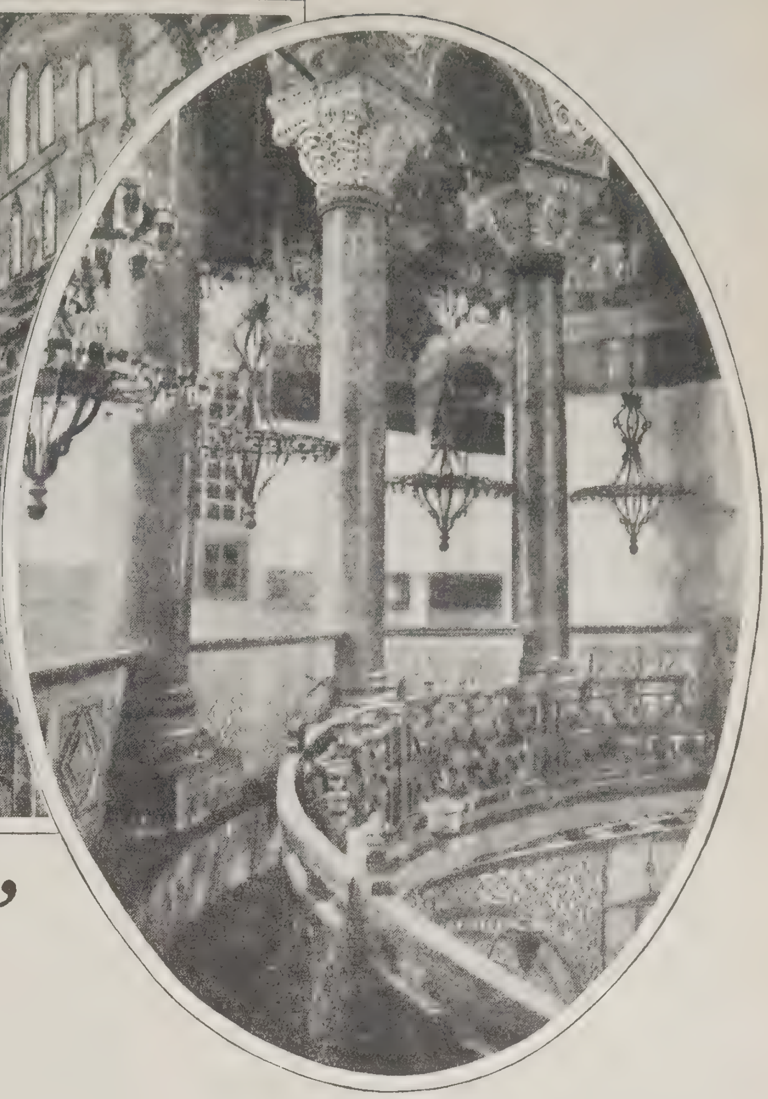
Some of the ranchers are thinking now that a wise man will not sit long in a game when the deck is marked and the dice loaded. They are even advising their sons to engage in some business where there is less risk and labor and more profit.

They have packed their city cousins so long they are beginning to weary of the burden.

What would happen if all the farmers decided to raise only enough food for their own use?

The Four Horsemen of the Apocalypse would appear, not in book form, but actual, living realities, galloping over and devastating the land as they are now doing in Russia.





The "Night of Power" in St. Sophia

American's Story of a Ramazan Ceremony

By MRS. JOHN R. ALLEN

Above, at left—Where the Sultan prays. Above—Where Mrs. Allen knelt to witness the celebration of the "Night of Power."

FEW Christians have witnessed the service of the "Night of Power" held in St. Sophia. The Moslems never take kindly to Christians invading their mosques; they tolerate them for the fee usually given. But services on the "Night of Power," the most sacred time of all the year, are not to be seen by infidels even for "backsheesh." One must have a "pull" to enter, as we learned from experience.

When we first arrived in Turkey we had little knowledge of the Turks or of Turkish customs. We had heard of the Monet of Ramazan, the season of Turkish Lent, of prayer and fasting, but of its manner of observance we knew nothing. Before the month was done we felt we knew all, and more than all, that Ramazan meant, if not to the Turks, at least to ourselves.

We were living at Roumeli Hissar, a quaint, picturesque Turkish village on the Bosphorus, about five or six miles above Constantinople. The houses rise in terraces from the water, at all angles, and the narrow, crowded streets meander in bewildering confusion up the hillside. Our boarding place was at the top of the village, and overlooked it and the beautiful valley of the Bosphorus for many miles. The second night after our arrival, when we were luxuriating in real beds instead of the narrow bunks of a rolling ship, we were awakened by the beating of drums and the loud cries of men in the village. The noise traveled up and down the steep streets with pauses now and then as if the drums were obliged to stop for breath. What could it mean! Visions of massacres, outrages, rose before us. What terrible thing might not be happening? That there was no sound in our house was reassuring. Evidently no one in it was alarmed so we listened to the hubbub until dawn came gradually to end the noise.

Upon inquiry at breakfast we found that the disturbance was because of the beginning of Ramazan. During Ramazan every Moslem is forbidden to taste food, drink any liquid, or smoke, from dawn till dark. But during the night they may eat, drink and smoke as much as they please. The Turkish year, being lunar, Ramazan may, in 33 years, run through every season. Beating of the drum serves to keep the people awake that they may eat at night and not be tempted in the day. The men who accompany the drummer continually call out, "Awake, prepare food, for the dawn is coming when you may not eat."

All day the Turkish housewife cooks. The breaking of the day's fast is announced by the firing of cannon a short time after sunset. For the rich Turk it is of no moment whether he sleeps by day, and eats and revels at night, but for the poor laboring man Ramazan is a time of hardship, and when it comes during the summer months there is much suffering and sickness, for not even a drop of water may be taken. Cholera and all stomach troubles are much worse during Ramazan. This year of which I write, there were strict orders printed in all the papers with regard to keeping the fast, and punishment and imprisonment threatened for anyone caught breaking it. One might think the first thing a Turk would do as soon as he heard the evening gun would be to drink and eat, but it is said he will sit with a cigaret in one hand and a match in the other, and as soon as the first boom sounds he lights up and has his smoke. The cafés are quite deserted and empty during the day, but at night they are brilliantly lighted and crowded with Turks smoking and drinking coffee, playing games, and listening to stories. The balconies on the minarets of the mosques are illuminated by rows of little olive-oil lamps, the wick floating on the surface of the oil.

The great night of Ramazan is the twenty-seventh night of the month. It is celebrated with much pomp and ceremony. Special services are held in the mosque of St. Sophia, and there are fireworks on the Bosphorus. This is the "Night of Power" when, according to the Moslem belief, the divine decrees for the following year are settled and fixed and given by God to His angels to be executed. It was on this night, also, that Mohammed received his first revelations. The services in St. Sophia, we were told, would be very impressive, and we were anxious to attend. Admission, as I have said, is difficult indeed to obtain, the Turks being loath to permit Europeans to enter. Our English friend said it would be necessary to get a card from our embassy; the next night we learned that the Sultan had signified his intention of being present, and in that case, not even embassy cards would admit us. The matter was discussed for several days, the final opinion being that, if the Sultan were present, nothing would admit us; if he were not—and no Sultan had been to a "Night of Power" for 20 years—then our passports or any proper credentials would be sufficient. So we did not ask for a card from the embassy.

The great night came; all day it had been dark and cloudy, with promise of immediate rain. Hoping it might be delayed until midnight we decided to go to the city with a number of the young instructors from Roberts College. With us was an Armenian gentleman who spoke Turkish. Another party also went from the college, and for guide they had a student, an Albanian Moslem. The only way to reach the city from the little suburban towns of the Bosphorus is, of course, by boat which lands you at the floating bridge between Galata and Stamboul. It was dusk when we arrived and the little oil lights on the minarets all over Stamboul were beginning to twinkle. The ceremony at St. Sophia was to begin at eight o'clock. The streets were crowded, mounted troops, foot soldiers, priests, and others all on their way to the mosque.

Our carriage landed us at the main entrance, or gateway. We crossed the courtyard in a sudden downpour of rain, and took refuge in the front door, or portico, where now, as it was almost eight, the faithful were entering in droves. There were two soldiers on

(Concluded on page 13)

Beautiful St. Sophia, where is celebrated each year the "Night of Power."

St. Louis Loses the Lead

THE taxpayers of St. Louis, metropolis of Missouri, are to be commiserated on the foisting upon them of a tax burden which might well have been avoided. A bond issue for $87,000,000 has just been approved for which a levy of about $7,000,000 annually will be required until the last one is paid. In the list of purposes for which the loan is made, those of urgent necessity could easily be cared for by raising a similar amount and restricting the expenditure to the particular object, thus paying as the expense is incurred and avoiding interest. That is, by pursuing the safe and sane policy of remaining out of debt, saving in taxes one and a half times the entire amount expended, or about $130,000,000.

We are not apprised of the exact state of the finances of St. Louis prior to this bond issue, but at the close of 1921 the city's indebtedness was $12,753,370, a more favorable showing than most of her rivals, perhaps than any, could make. It looks as if the amount just voted was intended to bring the bonded indebtedness to an even $100,000,000, involving a total expense of $250,000,000 to extinguish on the ordinary 30-year bonding plan at five per cent interest.

St. Louis has a population of 773,000, a real estate assessment valuation of a billion, and in 1921-22 a tax levy of $25,724,000, and a budget of $21,255,460. It will be seen that the opportunity for economy was fine, and had the taxpayers realized the extent of the burden placed on the city, it is incredible that they would have consented.

There is some excuse for a man going in debt for wearing apparel necessary to make a good appearance, but never to patronize a dollar-down installment store for something that will not last as long as the debt. There is no excuse for a man or woman buying on the installment plan something that can be done without; but here is a community plunged from a good position into a sea of debt that might well stagger a much larger place. In the list of projects can be found every conceivable plan for spending the money, from an aquarium to a municipal auditorium. The largest single appropriation, presumably a necessity, is new water works, requiring $12,000,000, and the annual interest and sinking fund requirements, which must be taxed, would pay that sum in less than two years, saving $18,000,000 that must now be paid in interest.

The next largest item is $11,000,000 for River des Peres reclamation work, hardly essential; with $8,650,000 for street widening, $6,000,000 for memorial plaza and building, $5,000,000 for auditorium, and smaller sums for work that could as well be postponed or cut out altogether.

St. Louis does not need this extravagant showing to enable her to be on an equal standing with other cities—she is already great, while the unique position of being perhaps the only city in the United States able to pay its debt without burdensome taxation is now gone.

Know St. Louis, official organ of the Chamber of Commerce and the agencies always clamoring for public expenditure, gives the key to the influence most potent in securing approval of the scheme. "Last Friday," it says, exultingly, "St. Louis voted an $87,000,000 bond issue for the most elaborate city improvement program ever undertaken here—perhaps anywhere. . . . This will give an immediate increased flow of money in St. Louis. It will give St. Louisans greatly increased spending powers."

Without graft, common in such cases, no St. Louisan will get a dollar he does not earn. The pay-as-you-go plan would have been sufficient to care for the unemployed of the city for a term of years. This plan will fill it with temporary and in many cases undesirable outsiders. But the real basis of conservation is the fact that for 30 years the money poured into St. Louis by the barrel will be flowing back to its source, carrying with it a volume 150 per cent larger than itself. Meanwhile, should an emergency occur, St. Louis, bonded to the legal limit, will be helpless, just as Detroit and Cincinnati are already.

Municipalities, as well as men and women, must learn that it is not wise to borrow for sake of civic pride. In their case there is a moral wrong, in that they leave a legacy of debt to a future generation.

Misrepresenting the Nations

INTERESTING and practical as are the personal opinions of foreign correspondents and representative investigators of conditions in Europe, they are yet mere opinions, formed through familiarity with the ruling regime of each country, and having no foundation in a knowledge of the peoples constituting the real nations of earth. Just as all wars are caused by human greed and not by real national volition, so may the rulers in power represent only a fraction of the nation itself.

Germany is no longer merely the tool of a militaristic dynasty. France is really not Poincare nor Clemenceau, nor even Paris. Britain is not and never was Lloyd George. Certainly the United States is not Senator Lodge nor even the President. We know what the governmental officeholders of Europe are thinking: the international press seems to exist for the express purpose of spreading their opinions. But what the plain people of the nations are thinking—who knows?

The main statement emphasized by the correspondents is that nations do not understand each other. But the main fact is that the leaders do not always understand the nations, and therefore cannot represent them. Could the common people everywhere understand why war is made, and the immunity the makers enjoy from its real burdens of death and debt, they might by refusal to serve their masters bring about a lasting peace.

Unexplained Legislation

UNDER an amendment to the National Bank Act, passed by this Congress and now operative, the number of compulsory statements the Controller of the Currency is compelled to ask for annually is three, instead of five, as heretofore. The importance of the measure is not known, but the mystery of its introduction is causing speculation.

The introduction of the bill was not deemed of importance by the press; its enactment into law was unnoticed; it was not debated in either house. The American Bankers' Association apparently did not seek the change, and no group of bankers or individual is known to have favored or opposed. To all appearance it was quietly initiated and put through from some department of the Treasury.

Such banking journals as have mentioned the matter seem at a loss to account for the amendment. The *Pacific Banker* speculates at considerable length, and while not sure more frequent reports are necessary, expresses the opinion that in the present feeling as to the banking system of the country, a reduction in the number of compulsory reports is ill-advised.

Farmers Need Profit, Not Credit

THE whole handling of the rural credits matter has been marked by such a subservience to the Money Trust that really compelled the politicians to make an effort to deceive the farmers by a pretense of friendship. Realizing something must be done to mollify the rising spirit of protest, the old false plan of authorizing additional machinery to meet a supposed need has been followed, and the farmer will meet the same delays he has met before, and obtain no real relief, after all.

The farmer does not want credit. Credit means debt. Debt has been the farmer's hell. What the farmer needs is not debt-making but debt-paying legislation. Credit will do the farmer no good until he has a prospect of meeting his obligations as they mature. The man who pays a debt by renewal does not get ahead. Ultimately he must *pay.*

There is no need for a bureau of credits to aid the man who has credit of his own. With banks in every locality whose officials are acquainted with the needs and responsibility of the people, the matter of credit is safe, if those banks are permitted to function. But so long as these banks themselves are subject to the whims of a central monopoly, a free exercise of judgment on their part is impossible.

Should the People Be Represented?

THE theory is that the people should be represented. No one seems to question it, yet no one seems to believe it to be the case.

A question, therefore: it is asked with a view to opening the door to the plain fact—*Where should the people be represented?*

Answer No. 1 would probably be: *The people should be represented in the White House.*

Granted. It would be very fine if the people were represented in the White House. The theory, of course, is that they are. Ask President Harding if any of the persons who come to see him represent the people. Just ask him. Ask him also if he has not entertained very serious doubts as to whether he, the President, represents the people. Ask him if he thinks any President can represent the people under the present system. Ask him once more if, in his experience, he was never rendered so helpless as at a time when he wanted to, but was forbidden to represent the people. The President himself, talking confidentially to a plain citizen at the back door of the White House, might advise him, in the spirit of American brotherliness, to go somewhere else, because representing the people is a job that has really been squeezed out of the Presidency. What a glorious time of renewed confidence and national power it will be when the job returns. Oh, if the man from Marion could only see it and make himself immortal.

Answer No. 2: *The people should be represented in Congress.*

Yes, indeed. There are men in the Senate and the House who are earnestly trying to represent and serve the people—and are breaking their hearts in the endeavor. Spend a few days in Washington with the "lawmakers" (as they are facetiously called) and let them speak for themselves. You will hear from the Senate and you will hear from the House that it's a burning shame the way the rights of the People of the United States are disregarded by Congress. You will actually hear them say it. Gentlemen will grow red in the face, they will expostulate, they will swear, they will call on God and Liberty—but in the end they will say to you: "I came down here to serve the people, but they won't let me." Why? The system is framed against it. This Congress just dead was actually prevented doing what it wanted to do by a dead man and a living man: the dead man made the House's rules, the living man administered them. The rules were for use in cases where the people might be likely to be served. In a long course of interviews certain reporters found it almost unanimous in Congress that while a majority of the individuals (a big majority too) *would* represent the people, there's an invisible something that prevents them. The most hopeful fact is that so many Congressmen recognize this to be the fact. It is going to mean something pretty soon.

Answer No. 3: *The People should be represented in the Supreme Court.*

To be sure they should—there more than any other place they should, for the Supreme Court is the supreme governing body of the land. Oh, not by law, as every schoolboy knows; the branches of our government are independent of each other—but the fact is that the Supreme Court is independent of them all. What a Great Court it would be if it represented the people. Will any Judge of the Supreme Court say, without circumlocution, without assuming things that he knows would not be true, that the Court represents the People? The question is asked because the Supreme Court judges were not asked the question when the reporters put it to the members of Congress.

However it is a question which is respectfully recommended to the present members of the Court, both new and old. If they will take it home with them some night, let them do this with it: let them call to mind the days of old when they thought of their country as all American boys do, when public service seemed a lofty thing—the thoughts they had before they knew the real ins and outs of things, the trades, the jockeying, the cheap political considerations involved; let them think also of their youthful notions of a Court, and of a Judge on the Bench thereof, and of the confidence, the respect, the pathetic appeal of the people—and let them answer, as one day in Another Court they must answer, whether the Supreme Court of the United States is a place where the American People—we the hundred millions who only want a Government to believe in—are represented.

Mr. Ford's Page

EACH age, each condition, each form of collapse is accompanied by its own scavengers. It is another way of saying that everything has its parasite. Still another way of saying it is the old Biblical method: "Where the carcass is, there are the vultures gathered together." The idea has appeared in the wise humor of Americans in the statement that "flees is good for a dog, because it keeps him from worrying about being a dog."

This fact of a scavenger or parasite attending everything is generally accepted, but it is not always regarded from the same point of view. There are those who complain about the parasite in nature, who think that the world would be a pleasanter place if the parasite were exterminated. They regard it as a regrettable and unnecessary defect in an otherwise fairly good system.

The problem itself goes back very far and at one time constituted a profound subject of theological speculation. The attitude of our more serious fathers was this: the earth is in a fallen state, and attending upon its various lacks and shortcomings there were bound to appear the consequences of its moral collapse. This idea they expressed variously, as that thorns came into the earth and weeds into grain, and death came upon living things, and hard labor was made the prerequisite of a livelihood, and social distrust and enmity made living together something less than the pleasure which it originally might have been.

Perhaps our fathers were wiser than we sometimes think they were; but it is certain that they were wiser in their attitude than are those moderns who have no explanation of the parasite at all. They were wiser in this: instead of complaining that the parasite existed where it had no right to be, they sought out what right and reason could be found in the parasite's presence, and they reached the conclusion that it was not the parasite's fault but the fault of conditions which called for a parasite's or a scavenger's services. That is, they explained the presence of the vulture by the dead carcass.

It is a method of explanation which certifies to its own truthfulness by the satisfaction which it gives to the mind. And this satisfaction is worth more than can be estimated. The suffering of the world, the real bitterness which men endure, undoubtedly grows out of mental outlooks more than anything else. Just at present there are whole mountains of suffering in America which are caused by a misinterpretation of our international position. Propagandists have told our people for so long a time that we are a selfish, heartless, utterly unsympathetic people that sensitive people who do not know the facts are suffering for a lie. America was recently visited by a very noble woman who impressed everyone who met her with the heartbreak she constantly bore with her, but the greatest pity of it all was, the suffering was predicated on things that were untrue. If that woman had known the truth about the international situation, the truth would have set her free.

> *IF IT were not for scavengers and parasites, the corruption of the world would become unmanageable. Wherever you see social vultures you may be certain that some kind of wrong is being consumed and destroyed. The chances are, however, that when the vultures and scavengers happen to be a dominant political system or a ruthless financial system, you may not see them in their proper light. But, if there were no corrupt thing, no social wrong to be borne away, they would not be there. Wrongdoers always must have a wrong condition else they cannot exist. If fakers exist, it is because there are people waiting to be faked. But the parasites are doing just one thing always—they are cleaning up, they are doing society's scavenger work.*

And so with this matter of parasite and scavengers. When you take it out of the region of theory and apply it to the daily facts of life, the truth of it and the real satisfaction of it begin to dawn upon one.

There is a most unsatisfactory political situation, let us say. The reign of the inept man in office and the reign of the very apt grafter out of office, make us wonder at times what is to become of the country. We constantly see things done under the highest authority and with all the accompanying circumstances of seriousness and dignity, which in private life would be condemned without a moment's discussion.

Of course, that is not the worst. The worst would be this: that these things should go on and no one protest. Or the worst would be this: that these things should continue successfully. But right there is where the truth of nature's scavenger idea comes in. Where the political system tends to corruption, the vultures gather together, consume the carrion and leave but whited skeletons to mark the event. The people who wonder and protest and despair, they are the sound stock who can sense corruption, but they are extremely foolish when they give way to despair, certainly they are living away below their privileges when they will not allow themselves to see that all of this means that nature's scavenger system is at work. Even political systems are no exception to the rule.

The scavengers, who have been charged to settle accounts with a financial system which has ruled the people instead of serving them, are already visible. It is a solemn fact that Fear sits at table with the holders of "securities" these days—the big "securities" which represent nothing and which fail even to bring security of mind to their world-dominating holders. The idea of wealth is changing. Men are looking at their packages of papers and are wondering just what, in a reign of justice, they would be worth. Men who formerly accepted the money system as it was, without question or doubt, are now studying it and are coming to conclusions. What does it mean? Just this—a new continent of thought is coming up and industry and politics are to have a new footing. The processes of displacement are already at work—one process is Fear in the minds of the unworthy, another process is Thought in the minds of the worthy. Both work nature's will to pull down the old, corrupt and harmful.

You read of tens of millions of money being lost (it's not money lost, but labor and confidence and creative purpose in life) when the workers of whole states are induced to buy "stock" in "oil wells." When you think of the farmer who must pay for his worthless "stock" by working for years to come to pay off the mortgage with which he bought his stock, the pity of it and the injustice of it are beyond utterance. All sorts of condemnation is heaped upon the heads of the "high power salesmen" and the deliberate crooks who deceived the honest workers. But isn't there this also to consider: if a country becomes so infected with the idea of getting something for nothing that whole populations can be moved as with a frenzy for unearned money, is it not just such a condition that brings the scavengers down?

Nature is impartial at least to the extent that the same dangerous tendencies are checked in whatever part of society they occur. Many things are being corrected in our days, many systems of corruption are being taken apart by worms and vultures, but it would be a mistake to think that this operation is confined merely to the system which is associated with Wall Street, for example. Wall Street itself is but a scavenger, a parasite, feeding upon a corrupt condition. That much will be conceded even by the most biased opponent of the whole system, namely, that institutions like Wall Street do not create, but exist upon, and in the end help to destroy a general corruption, a general wrongness of desire, throughout human nature.

To recognize the scavenger in nature is not to honor it. Nothing is to be excused in those systems which have profited either by the common man's cupidity or by his innocence. They themselves are the heralds of the doom which they bring and which sweeps them away. What remains is the mass of the misled who are still capable of following a better leading. These remain. The scavengers perish. They go down with the system which they have been instrumental in destroying. One by one the follies of social life become apparent to the social mass; one by one the foundation facts appear, and upon these facts enduring experience and character are built.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Boll Weevil Toll Threatens Catastrophe

Percentage of Crop Loss Grows as Area of Devastation Spreads; Introduction of Nitrogen to Soil Would Do Much to Cut Damage

By WILLIAM BUTLER

WHEN the Southern farmer looked over his broad cotton fields in 1892, and reflected upon the beauty of the myriad cotton blossoms, white, yellow and red, in the blaze of the Dixie sun, little did he dream of the fatefulness of that year. There emerged from Mexico a tiny pest which invaded his cotton kingdom, and in 30 years overran his fields and warred upon the useful cotton plant to such an extent that the production of cotton today is seriously imperiled. This little insect has wrought more damage than all the insect pests or fungus diseases known to cotton culture. It is the Mexican boll weevil.

To date the boll weevil has caused the South the partial loss of many cotton crops, or in all 25,000,000 to 30,000,000 bales, 500 pounds to a bale. Converted into cloth, this amount would be sufficient to make 500 shirts for every male in the United States. If estimated on the average price of cotton since 1900, the loss runs above $2,000,000,000.

The last six years have witnessed a calamitous increase in destruction. In 1921, damage to cotton was 24 times as great as in 1911. In that year and the present the loss has amounted virtually to a disaster, cutting the yield one-third, and in such states as Georgia and South Carolina as much as one-half. In 1921, 6,200,000 bales; in 1922, 4,000,000 bales perished in the bud because of the weevil. This unusual loss is due in part to mild winters, enabling a high percentage of weevils to survive and to get an early start in pillaging young cotton.

The weevil's war has reached an annual cost of $400,000,000, certainly a great hole in the buying power of the farmer, and affecting trade throughout the world. Added to this are big supplementary losses in land depreciation, closing down of cotton gins and oil mills, and shattering of the farmer's credit, since banks refuse to hazard loans to grow cotton under weevil conditions which eat up yield and entail high farming costs. Consequently, farmers by thousands have abandoned cotton production and moved to the cities.

Will Bring Diversification

IT TAKES no statistician to calculate that in another decade, if no more headway is made in weevil control than in the past, the great cotton belt will be planted to other crops. In fact, diversification of crops is already under way on a large scale.

What is the South doing to meet this scourge, and the world doing to help the South?

In a town in Alabama, citizens hail the weevil as a blessing in disguise. They have erected a monument in appreciation of it. They argue that it has relieved the planter from economic slavery, by forcing him to give up the old one-crop plan and to diversify crops and become self-sustaining, keeping the money at home that previously went to other parts of the country for food, feed and meat products. The outcome has been an adjustment to short cotton crops and fair cotton prices, freeing him from the pauperizing prices under which he labored for 30 years or more.

The weevil can in no wise be considered a blessing, any more than war itself. Its invasion has necessitated radical changes in the development of the South, but like war it is bringing famine and suffering. Today the world is faced with famine supplies of cotton. In two seasons, production has fallen behind consumption as much as 6,000,000 bales.

The word weevil is from the German, and connected with the German word *weben,* meaning to weave. The name boll weevil was given because the insect feeds on the buds and bolls of the cotton plant. The bolls hold the precious fiber so essential to the clothing of the world. Ravaging of the bolls means obliterating the source of cotton supply. Research indicates that the weevil feeds extensively upon no other but the cotton plant, and is solely dependent upon the plant for reproduction of its species.

It is called Mexican boll weevil because it originated either in the plateau region of Mexico or in Central America. It should not be confused with the cotton worm, bollworm or pink bollworm.

Crossed Rio Grande in 1892

ENTOMOLOGISTS tell us that it is a beetle of the genus *Anthonomus,* and the largest species of this genus, and above all the worst, in point of destruction, of the whole *Anthonomus* family.

The boll weevil is brownish-gray and about one-quarter of an inch long. Its long, sword-like snout is half the length of its body. The snout is plunged into the tender tissues of young cotton bolls.

The weevil can both crawl and fly, but its flying is rather feeble, and in flying any distance, it makes successive short flights.

It became first known in 1856 when its depredations caused cotton production in Coahuila, Mexico, the largest cotton-producing state in that country, to be abandoned for six years.

A decade later, in 1892, it crossed the Rio Grande River at Brownsville, Texas. Fifteen years after that, it swept across the great Mississippi River, and into the eastern part of the Mississippi Valley, where lay the richest cotton lands in the world. It was probably hauled across both rivers hidden in cottonseed.

By 1902 it had infested a large portion of the cotton-growing area of Texas, its damage then being estimated at $10,000,000 a year. During the first 10 years it attracted little attention, as its extension was at a slow rate, about 5,640 square miles a year. After 1902 it began to move more rapidly, and by 1906 had extended its area into Louisiana, Arkansas and Oklahoma. From then on it moved furiously, despite vigorous efforts to check it, and by 1917 was enlarging its domain at the spectacular rate of 71,800 square miles a year.

In 1921, practically the entire cotton belt, from Texas to North Carolina, except a portion of the latter state, had been covered, comprising a region more than 600,000 square miles in extent, and growing 94.6 per cent of the cotton crop of the famous belt.

Working Hours Nine to Five

THE reason for the rapidity of its spread is explained by its powers to multiply. Investigation shows that a single pair can produce 12,775,000 weevils in one season.

The weevil is a perennial vampire; where it goes it stays and multiplies. After being in Texas for 30 years, it did more destruction in 1921 than in any previous year.

Its hours of intensive activity are similar to those of the average business man, from nine a. m. to five p. m.

In emerging from winter quarters, it comes forth slowly, from March 15 to June 15, depending upon locality and climatic conditions, and if the temperature is as high as 65 degrees Fahrenheit; it can, however, be relied upon to be on the spot by the time the young cotton begins to blossom and bud, in June. The prolonged movement from hibernation is, however, of immense help to the farmer, enabling him to plant varieties of cotton that mature early, and in this way save a portion of it before the first onslaught of the weevil is under way.

Its hungry beak as a sword, the weevil starts forth to attack, and wherever the fatal sword touches the flower buds and green bolls of the plant, the leaves around the buds discolor, flare out and turn a sickly yellow. The buds drop off, but the damaged bolls hang to the plant, become stunted and barren in part or whole, and, if late in the season, shrivel up or rot; and so much cotton is lost. The signs of an infested field are heavy shedding of squares and scarcity of blooms.

With the minute jaws at the end of her beak the female cuts a small hole in a square (bud), and adjusts herself in the nest she has formed, depositing the egg therein.

The egg hatches in about three days, and the larva, a white curved grub, begins to feed on the inner tissues of the square or bud. It bores out a cavity sufficient to accommodate itself during the pupal stage, which transforms it into a weevil. The whole transformation from egg to adult weevil takes place in from 15 to 25 days. After issuing forth from the blighted bud, the new weevil is able to begin the production of another generation in five days.

Percentage of Loss of Cotton Crop Due to Boll Weevil

1922	1921	1920	1919	1918	1917	1916	1915	1914	1913	1912	1911
33	38	20	13½	6	10	13½	10	6	7	3½	1¼

Turn on Bolls Next

WHEN the females have placed eggs in the squares, their attention is next turned to the young bolls, and eggs are deposited in these cherished sources of cotton supply. It is an important point to note that the weevil prefers the squares or buds as food and a hatchery to the bolls holding the unfolded fruit.

The Bureau of Entomology, United States Department of Agriculture, comments on this interesting point, as follows: "As long as a large supply of squares is present, the bolls are not damaged to any serious extent. The bolls, therefore, have a fair chance to develop as long as squares are being formed." And again: "The cotton plant produces many more squares than it can carry to maturity as bolls. This surplus is shed by the plant throughout the season, under normal conditions about 60 per cent of the fruit being shed. Up to a certain point, weevil puncturing of fruit does not reduce the cotton crop, because large numbers of squares would be shed normally."

The age of the weevil ranges from 50 days to six months, mortality being high in hot weather. Hot dry seasons, with steamy air, are highly destructive to its propagation. As high as 90 per cent of the larvae infecting the squares that fall off, perish outright against the hot ground.

Cold rainy seasons, with dismal days, are favorable to its activity. Weevils have survived after having been apparently frozen upon ice.

The migration to winter quarters takes place in autumn. These quarters may be cracks in the ground, shelter under weeds, haystacks, piles of seed about cotton gins, or in burrs, late cornstalks, Spanish moss or the bark of trees contiguous to the fields. During the winter it takes no food and remains torpid. Only a small percentage survives the winter, normally about five per cent, and less in hard winters. It has many natural enemies. Some 40 or more species of insect parasites prey upon it as food. Also, brown ants, spiders, birds and domestic fowl eat it. These enemies do not molest the cotton plant.

The weevil has spread over the cotton belt practically as far as it can go. The big task now is to stop its multiplication. Hundreds of thousands of dollars have been contributed and expended for its extermination, but to little avail. It may never be exterminated, but its bill of damages can be greatly reduced.

The South must be mobilized into a co-operative whole. Its heritage and commercial supremacy, in being the one great base of choice cotton supplies, are not only at stake, but the welfare of the world is interlocked with the fate of the South.

The cotton belt furnishes more than four-fifths of the cotton consumed in American and European mills. The other important source is Egypt, where cotton of superior grade and staple is raised in the Nile Valley and the Sudan, but the total produced is only one-twelfth the size of the American crop. Besides, Egypt is infested with the pink bollworm, which is even more harmful to cotton than the Mexican boll weevil. The balance of the world's supply comes principally from India, China and Brazil. The first two grow cotton under primitive conditions. The crops command little or no commercial importance in American and European markets, being as a whole too low in quality to be profitably spun by spinners buying in these markets. As to the efforts of Great Britain to grow cotton in her colonies, these are an admitted failure. Africa and Brazil may some day have fine crops, but since the natives are densely primitive, some time must elapse before their cotton production will approach that of the South in a competitive way.

Soil Needs Nitrogen

THE world looks to the South as the logical home of King Cotton, and if the South fails in its obligation to supply the world, because of the weevil, the failure will amount to an economic calamity of international consequence.

The first step to combat the weevil should be to build up the soil with nitrogen and potash. Cotton thrives best in soil of high nitrogenous content.

The years of the war starved the bacteria of the soil in the cotton belt, keeping from it nitrate of soda and potash, materials essential as fertilizer. German supplies of potash were cut off, and Chilean nitrate went largely into the manufacture of munitions. Nitrogen is a great necessary constituent of fertilizer. Sixty-five per cent of the fertilizer produced in the United States is consumed in the South. That section is, therefore, a large consumer of nitrogen, necessarily so in fighting the weevil, as cotton must be forced to early maturity to escape as much weevil damage as possible. The belt was hard hit in the quantity and quality of fertilizer available during the war.

The relatively high amount of nitrogen that cotton draws from the earth is shown in its by-product, cottonseed meal, which contains seven per cent or more of nitrogen. The soil receives its portion of nitrogen either from natural agencies, rain and snow, or from fertilizer. Cotton, be it remembered, is essentially a dry-weather plant, and while the plant is making cotton through hot, dry seasons,* a heavy drain is made upon the soil of its nitrogenous strength, which passes into the plant. If the soil is to be kept with a sufficient supply of this energizing element for plant life, and annual shortages stopped, there must be more fertilizer used to enrich and sustain the soil during the cotton-growing season—fertilizer of highly concentrated grade, carrying nitrogen and potash or phosphoric acid.

Fertilizer Badly Needed

A NOTED chemist has estimated that the loss of nitrogen from cultivated land in America, as a result of inadequate fertilization, amounts to more than 3,000,000 tons of nitrogen a year. The soil of the South is today in a comparatively low state of impoverishment, literally starving for nitrogen in several sections of the belt, which accounts for the phenomenon occurring the last few seasons to the cotton crop. At the critical period of maturity, on which everything depends, the crop suddenly goes to pieces, losing 10 to 20 points in condition and dropping to 45 or 50 per cent of normal. In this state of low vitality, the sword of the weevil makes quick work of the crop.

The second step in overcoming the weevil is the cultivation of varieties of cotton that mature quickly, such as Simpkins, King, Cleveland Big Boll, Triumph, and so on.

The weevil, as previously shown, prefers to attack the squares instead of the bolls. The plant should be kept squaring as long as possible to shield the bolls.

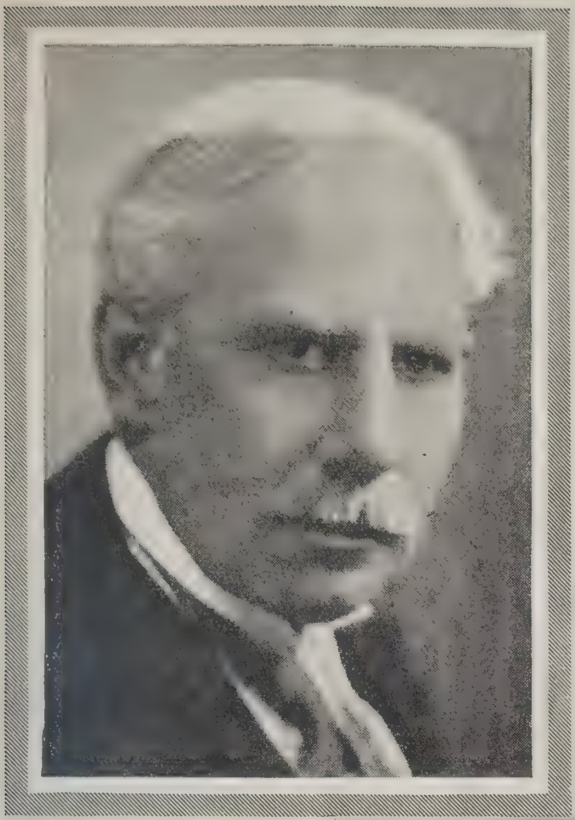
---

*South Carolina has frequent rains during growing season, which encourage weevil activity and lower the grade of the lint yield.

"Many Houses, Few Homes" Says Irving Bacheller

Famous Writer Says That Nation's Bankruptcy Lies in the Menace to the Home

By FRED L. HOLMES



(C) U. & U.

IRVING BACHELLER

The Gate o' the Isles

PERSONS begging for gratuities may seem to be a nuisance to most people. It is not so with Irving Bacheller, the famous author. He feeds them at some restaurant and cajoles from them the story of their life, their trials and disasters, their joys and fears, their hopes and ambitions. It is all grist for the mill.

"Generally these people are glad to tell their story," declared Mr. Bacheller in relating to me how he gathers some of the material for his novels and stories. "I have a good deal of color in that way. Perhaps my most useful trait is my interest in men."

There are other eccentricities about Mr. Bacheller which he did not tell me. Hamlin Garland, another author, declaring that while this characteristic gives much enjoyment to his friends, it is a serious matter to his wife.

"Mr. Bacheller's paths are strewn with forgotten rubber shoes, silk umbrellas and fur-lined overcoats," recently declared Mr. Garland, in depicting his contemporary's oddities. "He is not to be trusted to bring home a package, or to catch a train, and yet he has managed to accumulate a very considerable fortune."

Most men are afraid of failures in life. Some lie awake nights trying to plan ways to make money and steer their family bark at full head to the waves. Such thoughts were once entertained by the restless Mr. Bacheller, but after he had been stranded financially, he declared it was the one event in his life that lead him to the mountain peaks of achievement.

Irving Bacheller's ancestors are like the men and women he writes about in the "North Country." They have helped to clear away the forests, harrow the New England hills, and build the paths of commerce that bind and cement the nation. He is a Mayflower descendant. Born in a clearing in St. Lawrence County, New York, September 26, 1859, he has tasted the life of the pioneer from inside the cup. He has warmed his cold, bare feet on a frosty morning in the warm spots where the cows had lain at night, awaiting his coming to drive them home; he has picked the red clumps of wild strawberries in the early June of summer; he has mingled with birds and nature in intimate comradeship, and he early learned to sing the old-fashioned ballads of the pioneers, touched with the sentimentality of their age, in a voice of tender and sympathetic yearning. These experiences of youth are richly engrained and woven in the web of his life and he portrays these historic scenes like a troubadour, in poetry and prose, that will make his boyhood land live imperishably in American fiction. He is the Cooper of a later era.

Someone has said that Irving Bacheller may be found at any time with the plans for a new home in his pocket. He had a summer home in Riverside, Connecticut, where he could look out on the Sound and see the changing waters, the tides come and go, and awaken each morning to find some fresh surprise provided by nature in the way of atmospheric effect. This was burned in 1917 and has not been rebuilt.

It seems that after graduating from St. Lawrence University in 1882, Mr. Bacheller became a reporter in New York and found it "about the most difficult kind of business that a man ever attempted." He became a pioneer in the newspaper syndicate business. One day he wrote a sketch of Henry Irving, just before the actor began his first American tour. It came to the attention of the noted player. So pleased was he that he sent for the young newspaperman. There he also met Joseph Hatton, an English novelist, who had come to write Mr. Irving's impressions of America.

Out of this chance acquaintance was started the newspaper syndicate and the first novel sold to the papers was one of Mr. Hatton's on which Mr. Bacheller made $500.

"I have never enjoyed such a sense of opulence as that money gave me," exclaimed Mr. Bacheller.

During the next year he spent most of his time visiting editors, marketing serial stories. He built up an assured income of $40 a week.

The event that closed Mr. Bacheller's career as a newspaper syndicate representative was a "side issue." He declares that nothing is so alluring at times as a side issue, about which a person knows little or nothing. Featured with a gold seal and tied with a yard of red ribbon, this sleek-coated side line often got Mr. Bacheller's money as it has others.

"Owing to a complication in a side issue, that consumed my surplus and then threatened to devour the structure, it became necessary for me to sell my business," came the comment as cold and comfortless as if he were writing an epitaph. Soon I found myself with nothing to do and so I began writing."

At that time he was living with his wife in a little three-room flat in Tarrytown. With the pioneer experiences of his life verdant in his mind, he began to write the opening chapters of "Eben Holden." All day he would work at the manuscript and at night he would read his literary excursion of the day to his wife. She was as pleased as he about them. Finally the opening chapters were submitted successively to two magazine publishers only to be promptly returned. That was disheartening. Meantime, he was offered an editorial position on a New York paper. He accepted and the rejected manuscript slumbered for a year and a half in a bookcase drawer. One day Elbridge S. Brooks, Boston, who has known Mr. Bacheller for years, made inquiry about manuscripts.

"I fished those chapters out of the drawer in which they had been lying and sent them to him," continued Mr. Bacheller becoming more animated. "It was the first act in a swiftly moving drama. Mr. Brooks saw in a flash the things that I was driving at—an epic of the early westward movement and the ante bellum days of the North, told with truthfulness and restraint. Not three days had passed before a telegram offered me the usual royalties and a liberal advance if I could get a leave of absence and finish the story. I got it and went to work."

Even then he never dreamed that the novel would have more than ordinary success. Before the end of the year, the sale had jumped to 265,000. Five years ago, the total sale was over 600 000 and it has since been selling at a rate of 5,000 a year.

Interest in men, in the little peculiarities of people, have characterized Mr. Bacheller's success. All about are the things of interest, like "Acres of Diamonds." He believes that every person should train his memory —make it a storehouse of facts and life pictures. When he was a boy in his teens, his anxious mother began to give him a memory course. She offered him a penny a line for committing a list of poems While the financial return was small, he quickly acquired the stately language of Homer; the heroic march of events in Milton; soon the power and grandeur of Shakespeare's phrases. The task lost its financial appeal and gained in every lasting literary interest. At his command courtesan and cavalier, prince and pauper, prophets, priests and kings assembled like a regimental troupe to tingle his imagination.

Throughout the many volumes written by Mr. Bacheller is an idealization of the home; a respect of children for their parents; a high regard of men and for women. A great lover of the home, he decries the tendencies of the day.

"America is merely the sum of many homes," replied Mr. Bacheller in answer to the question as to what is the matter with America. "If the average home goes wrong, America goes wrong. This is the time of imported manners, industrious idleness, tinted ladies, India rubber parents, whose children are brought up to regard life as an island of ice cream in an ocean of candies and chocolate.

"There was a time that the homes of America were the wonders of the world. Great men were made at cheap expense and they made their mark in life without patronage of wealth and influence. The old home life was founded upon teaching and discipline, with modesty, thrift, industry and love of God as the keynote to that teaching. Girls were kept spotless. They were the priceless treasure of the house, for they, in turn, were to be the possessors of the young, the golden key to the future. In those days boys regarded the girls with awe. The boys are not so timid in these days.

"These days there are many houses, but

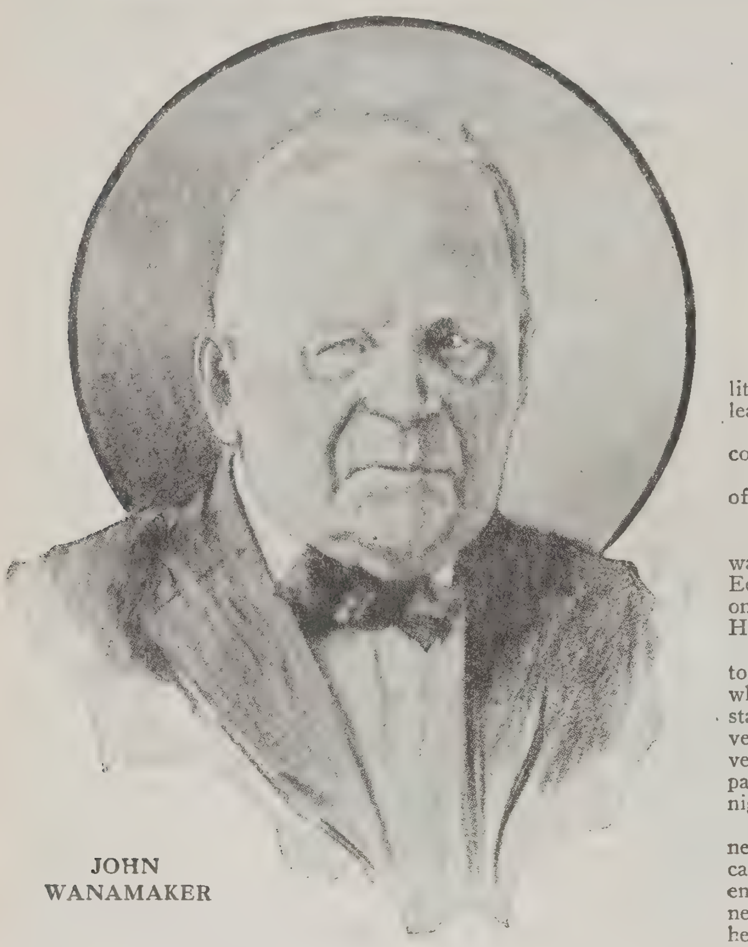
Unique Writings of John Wanamaker

Terse, Telling Little Editorials, Filled With Wit, Philosophy and Sound Common Sense, Appeared Daily for More Than a Decade

By J. OLIN HOWE



JOHN WANAMAKER

WITH the passing of John Wanamaker his unique series of daily editorials comes to an end. For more than a decade these paragraphs on life and those who live it have appeared each morning in the upper left-hand corner of the advertisements of his great stores in Philadelphia and New York. Their writer always referred to them as editorials and was at no pains to disguise his pride of authorship, as, indeed, he had no need to be.

They have been read 'round the world. Nothing in contemporary writing was just like them—or very close to it, in fact. Even English literary periodicals have taken note of their exceptional quality.

For a suitable comparison to his witty comments on the passing show, expressing keenest observation, phrasing a philosophy ripened and mellowed by the years, giving sage counsel, we should need go back to that earlier Philadelphia merchant and philosopher, Benjamin Franklin, and his Poor Richard's Almanack.

The Wanamaker editorials were part of the store's advertisement, signed by its owner, and in the main concerned themselves with business. Even when they digressed there was usually a clear point of contact with it. Their author contrived, however, to work in many a sound maxim or striking epigram and not infrequently even preached a sterling little sermon. People followed what John Wanamaker wrote for its own sake.

He often made use of quotations from standard authors and made plain how widely read he was, who had not had a classical education in his youth. And his shrewd discussion of the events of the day was watched for with real interest.

John Wanamaker's position as observer of national and world affairs was different from that of any other man of his time. That abused newspaper term, merchant prince, was truly applicable to him and his place as a business pioneer was secure.

His next birthday in July would have given him 85 years of experience. He had lived in several of the most absorbing periods of our national life, had known intimately the leaders in them and had himself become familiar with public life at first hand as a Cabinet member. He had looked over this old world from many angles and found it good.

Always he set great store by friendships, of which no man inspired more or more sincere, and this was often reflected in his editorials. One day last November he printed this: "It is a species of insanity for anyone to think he can go through life alone without a friend. Even Robinson Crusoe had to have a dog for a friend."

Not long after came this: "When a man loves no one but himself he will find out some day he has fallen into hard times."

"What is success but to make sacrifices?" came straight from the heart, as did "A kindly heart was given to us for everyday wear" and "Really, there are Christmas flowers which have been known to bloom the whole year through."

"There are educated men who are asleep on their feet." This was as near as he came to expressing the impatience with which his friends were familiar over an impractical attitude or unwillingness to work hard. And here is one of the last of his little sermons:

> "Thou, who posest to be a judge of colors—being blind.
>
> "Thou, who seest so much of wrong around thee, whose tongue waggeth all day long and everywhere condemning others who have a right as perfect as thine own to conduct their own business as seemeth best, be gently advised to take thy rest and stop within thine own doors and, without chatter, set worthy examples as patterns for thy neighbors, that there may be peace in the little town of thine own mind for at least a little while.
>
> "Hark thee to thine own icebound conscience!
>
> "'There is no good that is not born of good.'"

Many a time he commented in his kindly way on the utterances of another. "Mr. Edison says idleness is sickness," he wrote one day. "What does he know about it? He never indulged in it."

Let me tell of the origin of these editorials in his own words. "I had no idea what I was getting myself in for when I started this," he said. "At the Taft convention in Chicago in 1912, when Roosevelt's forces made a raid on the Republican party, we sat steadily from morning till night and sometimes far into the night.

"The warm weather and the strain nearly knocked me to pieces and when I came home I had to take a rest. It was the end of June before I went back to business. I spent the time at my closed house here in Philadelphia. One day my son (Rodman Wanamaker) said to me:

"'We are going to have some great times ahead to make our business what it was in 1911. Here you are reading all the time and probably hurting your eyes. Why don't you do something else?'

"'Perhaps it does hurt my eyes,' I replied, 'but what else shall I do?'

"'Write some advertising.'

"That didn't appeal to me at the moment. 'I wouldn't know how or what to write,' I said. 'I've never written any advertising, only blue penciled it a bit.'

(In fact, in the early years of his business he did write considerable advertising at his desk after the day's work was over.)

"As my son went out of the room, though, he looked so disappointed I felt I had done a mean thing. So I picked up an old envelope, cut it open and started to write on the inside. One envelope ought to be long enough for anything a man has to say, but when I reached the end I wanted to say more and took another, and finally a third.

"I sent these to my son, thinking I had seen the last of them. There didn't seem to be anything special in them. Next morning I saw what I had written in print!

"Yes, I think I was pleased. But I had no idea of continuing. Yet what could I do? I was like the visitor on the farm who, when passing a field, was chased by a bull because he wore a red necktie. To escape he caught the bull by the tail and held on, hollering for someone to help him let go. I had never had the least notion of writing, but there I was."

So he kept on. In the first month of it he missed but one day and more than once he voiced his regret at that. In the 10 years and a half Mr. Wanamaker wrote more than 5000 of these editorials and close to 4,000 have been printed.

He wrote every one himself and usually in pencil on some scrap of paper. His advertising managers have them all and they form a most interesting collection of original manuscripts. Very often he used old envelopes cut open, as in the beginning. Official mail from his New York store comes to Philadelphia in bright red envelopes and the editorial writer occasionally picked up one of these and used it. To the advertising office one of these red envelopes from J. W. always seemed to bear a particularly striking editorial.

Once in a great while he dictated an editorial to a stenographer, but that was not his style. He never wrote in business hours; from eight to five he was the busy merchant; then when the cares of the day could be laid aside he enjoyed sitting down with his notes for a philosopher's quiet hour.

These notes, of anything and everything which he might perhaps use, he took at all times and in all places. During a business or social conversation, on the train or in the street, even in church, he would jot down what he wished to remember. He had pockets full of them, even overcoat pockets.

Idleness held no lure for him. In Florida winters he was as painstaking in the preparation of his editorials as when at home.

John Wanamaker had seven desks, working desks, every one piled high with matters which must receive attention. Two were in his Philadelphia store, his principal desk in the main office and another in a smaller room at the end of the suite of offices in which he was supposed not to be disturbed. But, in fact, there were a certain few in his organization who had the entrée even there.

Then he had a desk in his New York store, one at his city home in Philadelphia, one in his house in Lindenhurst, one in his Atlantic City home and one in Florida. His editorials he carried in his pocket more often than not. And, perhaps, a week after he had written one he would tear it up.

At times he would write a number ahead—usually the advertising office had a week's supply—but often these would never appear. When he came to read them over they seemed to lack something and he would write others of more instant application. Even though it might be in the advertising manager's desk, until the magic initials "J. W." were penciled on what he had written it must not be printed.

"The hardest thing," he said once, "is to get something that would be worth keeping or remembering. I must have torn up a thousand or more of these pieces of mine which were not worth printing. My conscience won't let me take people's time to read some of the things I write."

Given to terseness, one of John Wanamaker's best things was not in an editorial at all. On the occasion of an anniversary celebration the Bridgeton, New Jersey, Young Men's Christian Association asked him for a sketch of his life. He sent this telegram:

"Thinking, trying, toiling and trusting in God is all of my biography."

Many readers of his editorials wrote letters about them and the effect of them to their author. In the years he was writing he received thousands of such personal letters. These interested him greatly and often he was deeply touched, especially if a father or mother wrote him about a son whose course in life had been altered by something Mr. Wanamaker had written.

One of the big things in his life was helping young men, but age or sex made little difference if he could hold out a helping hand to somebody who needed it. It meant everything to him to be able to "help people who are in a fog about life," as he put it.

He liked to tell the story of the graduate of a woman's college who wanted to write stories and books and rather chafed under the necessities of the work she was doing in his advertising department. In the end she went to Paris as a buyer and now she is the successful head of a department in the Philadelphia store, in a vastly different career from that she had planned.

One of John Wanamaker's most timely editorials was printed two days after his stores had begun the fateful 20-per cent discount sale of May, 1920. For months retail business had been pretty much at a standstill. The country appeared on the verge of a grand smash. Wanamaker suddenly offered the entire stocks of his stores at a straight discount of 20 per cent from regular prices, and this started a movement which saved American retail business and the lines dependent upon it.

The Wanamaker editorial that caused the comment was headed, "Who Were the Buccaneers?" Mr. Wanamaker gave the facts about Morgan, Blood, l'Ollonais and others. Then came this, "Buccaneering seems to have passed away, but there is much bushwhacking today," and the editorial wound up by saying, "It has been proved that there is but one sure foundation for banks, trust companies and business enterprises to build upon."

WANAMAKER EPIGRAMS

We can only reach each other with sympathy, the biggest word among the three or four big words of the world.

Let us be citizens first, and not merely bankers, lawyers, merchants and manufacturers.

There are many croakers upon the edges of lakes and creeks; there they sit croaking and croaking; but they are only frogs after all.

A man's true estate is not in houses, railroads, bonds and the like; it is in himself.

I believe it is true that every baby is born with a song in its mouth.

To stay by the lesson until it is learned and stay by the work undertaken until it is completed is the real thing.

Why should people get old and cease to smile and sing the whole way through?

There is so much to be done, and each day is a gift that we must try to make use of for some good purpose.

Service is something deeper and broader than political parties and commercialism means much more than making money.

Gives Up Her Life to Establish Sacred Drama

Remarkable Presentation of Passion Play Had Through Woman's Sacrifice

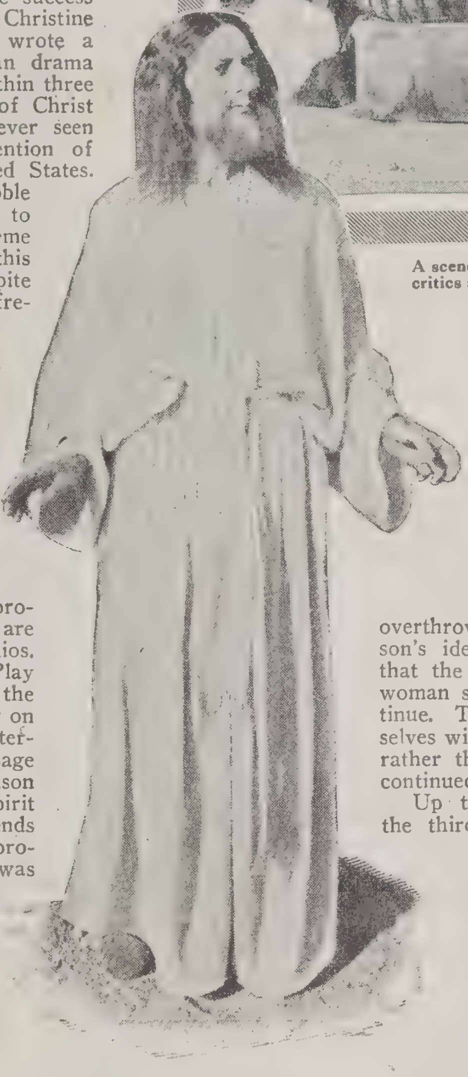
A scene—the Last Supper—which called forth remarkable praise from artists and religious critics alike. Many of the colorful costumes worn by these characters were bought from peasants in Palestine.

AN UNKNOWN woman, quietly and with sublime faith, lighted a torch in the West which men are beginning to say will do more than leagues and conferences of statesmen to show mankind the path that leads back to abiding peace. She has shed new light on the path that leads to a contrite heart. Unlured by the pleasures which she might have had from great wealth possessed by her family and refusing at all times to capitalize for profit the success which finally crowned her efforts, Christine Wetherill Stevenson, of Philadelphia, wrote a chapter in the history of the American drama which is destined to stand as unique. Within three years she created a drama of the life of Christ surpassing anything this country has ever seen and brought it to the favorable attention of thoughtful people throughout the United States.

It seems peculiarly tragic that this noble woman should have been called upon to give up her life in payment for the supreme devotion she displayed in bringing out this great production. It is said that despite outward appearance of health, she frequently suffered much, particularly during long and taxing rehearsals.

Of interest, also, is the fact that she chose Hollywood, "the world's film capital," as the scene of her production. It offered the rainless summer nights so desirable for long periods of outdoor performances and also possessed a large constituency of people with experience on the stage from whom she could draw for her cast. She gathered about her more than 100 actor folk, carefully selected but nevertheless fairly typical of the profession. Many of these were and still are employed in the motion picture studios. For their services in the Pilgrimage Play they have received but a fraction of the wages they earn acting for the screen or on the legitimate stage. But with characteristic faith in the power of the message which she wanted enacted Mrs. Stevenson appealed to these stage people in the spirit of Him whom they were to portray. Friends told her that acting was the habit, the profession, of the people with whom she was dealing and she could not hope to get "under their skin," much less into their hearts, with a Bible story.

But her extraordinary success confounded her advisers. Today the Pilgrimage Play is better known than any other sacred play except the Oberammergau production and it now bids fair to surpass that historic effort in fame and attendance. While the future management of the Pilgrimage Play is as yet somewhat unsettled and certain commercial interests have sought to overthrow Mrs. Stevenson's ideal it is certain that the work this lone woman started will continue. The actors themselves will sacrifice much rather than have it discontinued.



The Christ has been taken by Henry Herbert, the eminent English actor, for three seasons. During the play season he lives almost the life of a recluse in a small cabin overlooking the theater.

Christine Wetherill Stevenson Lights Torch in West That May Do More Than Leagues and Conferences

By JOHN ANSON FORD

Up to the close of the third season nearly 200,000 persons had found their way up the winding path that leads to the reproduction of the Jerusalem Gate forming the entrance to the Pilgrimage Theater. What these people have said and what they have manifested in their faces as they saw the outstanding incidents of Christ's life enacted before them proves unmistakably the truth of Mrs. Stevenson's theory. In effect, she said: "The world is impatient of creeds that spend more energy emphasizing differences than they do beliefs held in common. And yet the world wants religion and wants it earnestly, almost pathetically. By common consent Christ was the greatest teacher the world has ever seen. He penetrated further into the mysteries of life and death than anyone else who has ever lived. Let us forget the many differences which have sprung up among his followers in the 1,900 years since His death. Let us get back to the simple story of events as we find it in the gospels."

That was the dynamic ideal around which Mrs. Stevenson built her play. It has proved well-nigh universal in its appeal. As far as I have been able to learn, it has aroused the antagonism of no creed or sect. On the contrary, it has won instant praise from Catholic and Protestant, Christian and Jew, Oriental and Occidental. A Los Angeles rabbi has witnessed the play repeatedly and spoken in reverent praise of its marvelous story. Tasuker Harada, a prominent Japanese educator, wrote: "I hope the play will be a mighty influence in the propagation of the Christian truth and spirit—the greatest need of this present world."

That testimony is but typical of thousands which Mrs. Stevenson received from persons in all walks of life. These words of praise were her only reward, for she refused from the beginning to make one cent of profit from the play but instead expended tens of thousands of dollars of her own money on the production before it was finally brought to a self-supporting basis.

Mrs. Stevenson set out to "transcribe" the life of the Christ. Her Bible was the only source for her text. Only the recorded words of Christ were used in the Master's utterances and with but few exceptions only words found in the Bible were used for the other speaking parts.

It might appear that Mrs. Stevenson set herself to a rather simple task but as a matter of fact and experience it proved so difficult that only extraordinary ability and devotion made success possible. Of several hundred recorded incidents and sayings in the life of Christ only a comparatively few could be used. The problem was to select understandingly. Just as a master etcher deftly marks the plate here and there with bold lines and then supplies delicate details in certain parts of his picture to produce an imposing view of a great cathedral, Mrs. Stevenson selected and arranged scenes in the life of Christ so skillfully that in three hours the beholder of the play seems to have reviewed the whole life of Christ. In a single evening the immortal message penetrates further into the average spec-

The beginning of the Triumphal Entry. This view of a portion of the Pilgrimage Play stage and its natural background, shows what a vast area of mountainside has to be illuminated artificially during certain scenes. (The play is never given by daylight.)

A Dream of Forty Years Which Came True

Thomas Jefferson Conceived, Planned and Established a Great University;

Attractive Buildings of Campus Held Together by Beautiful Colonnades

By GEORGE H. DACY

A STUDENT, a profound thinker and a statesman who planned for the future, Thomas Jefferson in 1785 began to meditate, to dream of a great university which would one day be an honor to his state and a famous clearing house for practical and scientific education. Himself a graduate of William and Mary College, Virginia—a school which was founded in 1680 and used as a training seminary for the clergy—Jefferson early championed national education and the development of a circuit of elementary schools, academies and colleges as the foundation of the potential progress of the original 13 states. Thomas Jefferson sponsored proposed national legislation which had it been accepted by Congress would have given the United States a superior system of schools decades before anything of much importance was actually done toward providing for country-wide education.

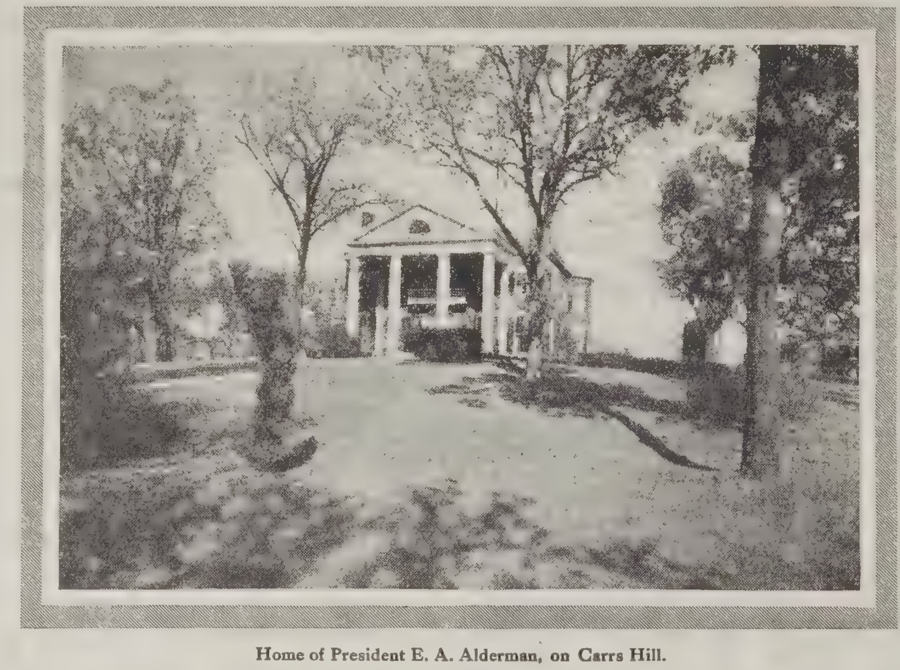
Time and again, Jefferson remonstrated, protested, argued and debated with other leading Virginians and the state legislators trying to arouse them to definite action looking toward a state-wide system of schools. Jefferson's plan for the Old Dominion was a district school every four miles in all directions throughout Virginia as well as a chain of colleges so scattered that no town or village in the state would be more than 100 miles from a good college. Mr. Jefferson advocated a great central university as the hub of the Virginian educational system. As often as Jefferson or some of his friends put this plan before the Virginia state legislature, just so often was the scheme rejected. In matters educational, Thomas Jefferson lived a century in advance of his associates and neighbors.

"A university is a place that attracts the affections of the young by its fame, wins the judgment of the middle-aged by its beauty and rivets the memories of the old by its associations." This was just the kind of an educational center Jefferson dreamed of for 40 years and used every agency in his power to establish in the heart of his beloved native Virginia. Once Jefferson said, "I have sworn upon the altar of God eternal hostility to every form of tyranny over the mind of man." Yet despite his energetic efforts to free the people of his state from the tyranny of ignorance by the establishment of a worth-while educational system, it was not until 1825, more than four decades after Jefferson began his strenuous campaign for the University of Virginia, that that institution enrolled its first quota of 128 students and began a career which shortly made it famous among all American colleges and universities.

It is doubtful whether another school is so wrapped up in romance, historical lore and collegiate curiosities as is the University of Virginia. Three men—Jefferson, Madison and Monroe, who served honorably and well as chief executive of the United States—were members of the board of visitors and trustees of the University of Virginia in her early days. This institution was the pet hobby of Jefferson and the favorite of Madison and Monroe. Of the monuments, great and small, which have been erected in all parts of the country in commemoration of Thomas Jefferson, none can excel the practical memorial—the University of Virginia—which he fostered, fathered and nurtured for the benefit of his home state. The greatness of Jefferson, his democracy, his honor, his artistic nature, his culture and refinement are all graphically reflected in the University which he founded. To see this southern university in all her splendor and simplicity is better to appreciate and reverence the great Jefferson.

In 1783, when Jefferson was departing from Albemarle County, Virginia, to assume his duties as a Federal lawmaker, several of the leading citizens of his home community requested that in Philadelphia he try to obtain a tutor for a proposed private academy which was then in the making in Albemarle. Unfortunately, Jefferson was unable to locate a first-class teacher. The project of the academy hung fire and dragged along and it was not until 27 years later that the institution was finally started. It prospered largely through the influence of Jefferson and ultimately its promoters decided to enlarge it into a literary college. Just as they were drawing up the final papers, Jefferson happened to ride by. His opinion was asked regarding the possible success of the project. Immediately sensing the opportunity of putting into actual practice his pet scheme of a large university, Jefferson argued at great length with his neighbors and finally got them to accept his plan. A hot battle was then waged in the state legislature to secure appropriations and support for the school. Joseph Cabell, a cultured and talented Virginian who had been educated in foreign countries and who had traveled extensively abroad, aided Jefferson in his remarkable campaign which ultimately resulted in state support of the university.

A great controversy developed over the location of the University of Virginia. The three cities of Staunton, Lexington and Charlottesville all demanded that the school be situated in their environs. After a hot contest, Charlottesville was finally selected as the seat for the school. Jefferson purchased 200 acres one mile from the center of the city for $1,500, and this tract was accepted as the site. The state legislators wanted to build cheap, wooden buildings. Jefferson insisted that attractive, permanent structures be put up. He personally drew the plans and designs for the famous series of buildings which have made the University of Virginia architecturally outstanding from that day to this. Jefferson devoted all his spare time to the supervision of the building activities. The university was projected officially in 1816 but it was not until nine years later that the first students were registered and the initial classes held. Today the University of Virginia owes its dignity of architecture and its beauty of surroundings to Thomas Jefferson a statesman who also was a great educator and the pioneer disciple of American education for Americans.



Home of President E. A. Alderman, on Carrs Hill.

There is no other university in the country which has a layout, buildings and campus like that of Virginia. Fortunately, additions and improvements followed religiously the type of architecture to which Jefferson adhered. As a result the finished campus is a wonderful example of architectural steadfastness and simplicity. Instead of building costly dormitories for the students, Jefferson constructed simple and attractive one-story pavilions. Serviceable hotels were built and used as mess halls. Spacious and handsome colonnades unite all the pavilions. The pavilions, study halls and class rooms were built in quadrangle style around a central square or campus called "The Lawn." Jefferson urged that none but unmarried instructors and professors be employed in accordance with the customs followed in the leading English universities of that day. However, his associates over-ruled his desires and certain pavilions were reserved for the use of the teachers and their families. Great difficulty was experienced in assembling the original corps of teachers. None could be secured in this country. As a result of Jefferson's large acquaintanceship abroad, four Oxford graduates and one German professor were proselyted from Europe. It took four months for them to make the trip across the Atlantic Ocean.

Ten pavilions and special dormitories, six hotels, the dormitories of the East and West Range and "The Lawn" were all ready to receive visitors and students several years before school officially opened. The Rotunda, a big central building which served as a library, entertainment hall and auditorium, was completed the following year and was used as a banquet hall for a famous dinner which the citizens of Albemarle County gave in honor of General Lafayette. The Jefferson portico is one of the remarkable features of the campus. It is 50 feet long and consists of 10 columns, each of which is 28½ feet high. Through it the graduates throng after commencement on their exit from the university and their entrance into the affairs of business, commerce and the home.

A cemetery, a miniature Westminster Abbey, is an unusual feature of the campus. In the simple, unostentatious burying ground are interred the remains of some of the most famous sons of the University of Virginia. Close by is a Confederate cemetery where many college boys who were killed during the Civil War are buried. A beautiful memorial statue has been erected in honor of these brave collegians who risked all for the Confederate gray. A much admired statue of Thomas Jefferson is another campus ornament. It pays honor to Thomas Jefferson as author of the Declaration of Independence, founder of the University of Virginia and sponsor of the Old Dominion statute of religious freedom for all sects and creeds.

As the university was under construction, Jefferson was wont, at times during debates about how this or that should be done, to bring into play some of the unusual epigrams for which he was noted. Some of these appropriate statements which not uncommonly told a long story in a few words are as follows:

Never trouble another for what you can do yourself.

Never fear the want of business—he who qualifies himself well in his calling never fails of employment in it.

Never spend your money before you have it.

Never buy what you do not need because it is cheap—it will be dear to you.

The object of all learning is the freedom and happiness of man.

Honesty is the first chapter of the book of wisdom.

Always do what is right.

When angry count 10 before you speak—if very angry, 100.

Nothing is troublesome that we do willingly.

The happiest man is he of whom the world says least.

Pride costs us more than hunger, thirst and cold.

We never repent of having eaten too little.

Love your neighbor as yourself and your country more than yourself.

A famous educator who visited the University of Virginia many years after the death of its founder said, "A visitor pacing slowly through the monastic colonnades extending along the sides of the great quadrangle and campus receives a strange variety of impressions from the extraordinary architectural combinations which greet his wandering eyes. The arcades themselves from which open directly the single chambered rooms of the students remind one of the cloistered walls in some ancient monastery. They are like the cells of the early monks. Wonderful façades front on the pavilions and homes of the professors, reproducing classic styles of architecture. They cast shadows of remote antiquity on the beautiful grassy lawns of the campus."

The Virginia campus is an apt reproduction of many of the famous buildings of Rome. Although Thomas Jefferson never visited Italy during his European travels, by the use of A. Palladio's famous books and pictures of Roman buildings, Jefferson designed structures which look for all the world like the magnificent structures of the early Romans. The Rotunda or library is a copy of the Roman Pantheon. One pavilion is an adaptation of the Doric of Diocletian's Baths. Another is Palladio's Ionic order with modillions. A third is a Doric of Palladio. Others are Doric of the Theater Marcellus, Ionic of the same theater, Doric of Albano, Ionic of Fortuna Virilis and the like.

The most treasured volume in the university library at Charlottesville is the dog-eared Bible of Thomas Jefferson which was presented to him by Chancellor George Wythe, his beloved preceptor at William and Mary College. The University of Virginia Young Men's Christian Association was the first organization of its kind established at any institution of learning. Virginia is also the first school to develop and abide by an honor system. Even during the first days of the university, Thomas Jefferson advocated a minor form of the present honor system as the ideal method of dealing with the students. Thereafter, in a casual way, this early form of student self-government was followed. There was one thing that Jefferson was adamant about and that was that every student must arise at dawn. Bells were rung and the janitors visited each room and routed out the sleepy laggards. Throughout his entire life, irrespective of what time he retired, Jefferson jumped from bed at the break of day. He demanded that the students who attended the school which he founded do likewise.

It was not until 1842 that the honor system was permanently established. Thereafter, all students wrote examinations without any surveillance on the part of the instructors. Each student was required to sign his name to his paper under the written pledge that he had neither given nor received assistance. Only a few cases of dishonesty have occurred since the inception of the honor system. They have been summarily punished by the students themselves who have quietly visited the transgressors and demanded that they leave the school

immediately. The honor system has really transformed the University of Virginia into a huge gentleman's club. Expulsion is the worst stigma that can be meted out to any member. A Virginian who is convicted of cheating at the state university is subsequently debarred by popular sentiment from holding any offices of honor in the commonwealth. He is ineligible to join any clubs and is excluded from occupying all places of trust and confidence. Veritably he becomes a pariah and an outcast of cultured society.

Jefferson feared that dueling might develop as a method for settling disputes and animosities just as it had found a prominent place in the affairs of the foreign universities with which he was familiar. Hence he formulated a very arbitrary rule when the school was first opened that any students who engaged in dueling would be expelled and never allowed reinstatement. The result was that a duel has never been fought, the nearest approach being friendly tussels with boxing gloves or contests on the wrestling mat. Jefferson was also the father of the idea that the students should be permitted to select the studies and lecture courses which they would take. Other schools at that time favored an arbitrary curriculum which allowed the scholars no electives.

During the early days of Virginia University, athletic sports were neglected. The first few years all students were obliged to practice military drill and tactics but shortly this system was abandoned. It was not until 1852 that Monsieur D'Alfonce was appointed physical director. He trained the boys in gymnastic sports and taught them how to drill. One curious custom which he introduced was for the athletes to join in singing some martial strain such as the Marseillaise each evening after they completed their gymnastic work. This French trainer remained at Virginia for 14 years. During the next decade, athletics were entirely neglected. Interest was revived by a gift of $1,000 from an alumnus for the establishment of a boat club. For several years, Virginia maintained racing crews which defeated all comers in her sections. Then an untoward flood washed away the boathouse and ruined the shells. Rowing was never resumed as a college sport.

Rugby football was played extensively as early as 1870 and American football was established as a regular sport seven years later. The Virginia "muffers," as the first baseball club was called, were proficient with the willow as is indicated by the fact that in one championship game, they trounced the renowned Potomacs of the District of Columbia 117 to 19. Up to 1888, the college colors at Virginia were gray and red, emblematic of the gray of the Confederacy dyed in blood. As this combination of colors was not well suited for athletic uniforms, a change was made during the early days of college football. One of the players on his way to practice attended the meeting clad in his football togs. He wore a silk orange and blue handkerchief—an English cricket scarf—around his neck. In the midst of the discussion, one of the students pointing to the scarf cried, "What's the matter with that combination for college colors?" Since that day the orange and blue of Virginia have been prominent on the eastern and southern athletic fields.

The Horrors of Trapping Animals

By DR. WM. R. BRADSHAW

WHEN an animal is caught in a trap it will free itself by gnawing its foot off, or twisting its leg off. In the latter case it must of necessity pull out its own sinews. Imagine the agony that will impel an animal to endure such pain!

An animal caught in a trap in extremely cold weather is likely to freeze to death before the trapper ends its agony. The trapper, without sympathy, sets out traps that require three or four days to reach on his rounds. The animals, that do not succeed in gnawing themselves free, suffer indescribable torture.

A trapper, accidentally caught in one of his traps, but fortunate enough to be rescued before death arrives, knows the fierce agony of being held by the relentless iron jaws, miles from human habitation, with death staring him in the face. To prevent animals escaping from the ordinary single-jaw trap, a frightful double-jaw trap has been invented, so that it can never pull out the part held between the double jaws of the trap.

Many animals have been caught by the only foot they possessed, the other three feet having been lost in former traps. Beaver, caught in traps sunk in shallow water in the runways that lead to their houses, frequently lose all their paws in their battle for life.

The "spring pole" method of capturing animals is used to prevent them from escaping by self-mutilation. It consists of a flexible sapling bent downward and held in that position by an easily unloosed contrivance and the trap is fastened to the sapling by a chain. When the animal is caught, its struggles to free itself unloose the arrangement that holds the sapling down, whereupon the trap and animal caught therein are jerked upward. Perhaps the animal hangs in this cruel position for several days before death.

Bears are caught by the paw in a heavy trap, fastened by a chain to a log that can be freely dragged about, barring entanglement, which will prevent the animal going too far away. The savage teeth of the trap hold the paw. Meantime the trapper has an opportunity to shoot his quarry at leisure.

But it must be emphasized that the practice of trapping, however limited the indulgence, has a deteriorating effect on the moral character of all who engage in such a cruel pursuit or pastime. The liberty allowed either a youth, or an adult, is an absolute power which always corrupts unmistakably. Boys develop either a love or a hate for animals, according to the direction their teaching takes.

The boy who has been taught to respect and care for an animal will develop a sense of responsibility and a degree of moral exaltation that are humanizing to a high degree. Animals will regard him in turn as their benefactor.

The list of pet animals is a long one. If a Shetland pony, a donkey or a goat, be too large a responsibility, there are the dog, the cat, the fox, the woodchuck, hens, ducks, opossums, the raccoon, the prairie dog, the rabbit, the guinea pig, the monkey, the squirrel, pigeons, pheasants, parrots and peacocks.

Here is a fourfold combination whose hands are equally covered with the blood of iniquity to animals: The trappers deal in torture for cash; the manufacturer sells the luxurious, torture-tainted article for cash; the dealer connects the trade and its horrors with his customers for cash; the woman buys these dreadful articles for cash, to gratify her vanity. Thus, thirty millions of tortured animals are yearly sacrificed for the sake of selfishness, greed and vanity.

The trapper, the manufacturer, the dealer and the woman, all combine to destroy the best impulses of mankind for the sake of their personal desires. At this moment, indeed, hundreds of thousands of animals are suffering the most intense cruelty at the hands of these selfish and cold-hearted human beings.

Furs are a moral disfigurement; fur-fabric garments made wholly from wool are quite as graceful and much more healthful. By discarding the proceeds of torture, the women of this and other countries—including a great many men also—will have given the world a mighty impulse toward the day when righteousness will cover the earth as the waters cover the seas.

In the summing up it is clear that a great burden rests upon the shoulders of our women. Any one of a humane disposition must be filled with infinite sadness to walk along any of the principal avenues of our cities in winter, and see the thousands of women clad in the barbaric display of costly furs, knowing with what terrible cruelty such furs are obtained.

Little Enthusiasm for Philadelphia Fair

Substantial Business Interests of City Warn Against Exposition Because of the Accompanying Inflation

By WILLIAM A. M'GARRY

This is the second of two articles dealing with the speculation that arose in Philadelphia in connection with the plans for a Sesquicentennial Exposition of Independence in that city in 1926.

EARLY in January the New York *American* attempted to show that British influence is responsible for the widespread opposition that has developed in Philadelphia to the plans for the Sesquicentennial Exposition of the Declaration of American Independence. The argument itself is obvious—that the opposition to the fair was all part of a British movement to make Americans forget the War of Independence in the hope that by so doing British influence and dictation in this country might be increased. It is also interesting to note that the Hearst papers have been extraordinarily active in the publication of Jewish-inspired propaganda.

The *American* article named one or two of those who have refused to lend themselves to a gigantic real estate promotion scheme, but it did not list the names of more than 500 business and professional men who on November 4, 1922, signed their names to the following charge in an advertisement appearing in all the Philadelphia newspapers:

"Oppose the Fair. Join the Town Pump Party. Promoters of the Sesquicentennial Exhibition would lead our citizens to believe they are committed to an International Exhibition in 1926. This is not so. Real estate speculators and sentimentalists are the chief promoters of the fair."

The "Town Pump Party," it should be explained, is the phrase coined by James M. Beck, solicitor-general of the United States, to describe the business interests that are opposed to the fair. It has been shown in a previous article how many of the most active workers in what started out to be a modern replica of the Centennial celebration withdrew their names and refused to have anything more to do with it when they learned the extent of the real estate speculation. Homes of workmen in a large area contiguous to the site originally selected for the enterprise have been forced up in price by repeated sales of options to figures double what they had reached through war-time speculations. Mr. Beck spoke at a mass meeting engineered by those who are still in favor of the fair, but, of course, said nothing about the inflation of real estate values. Perhaps he did not know.

Mr. Greenfield's Position

IF HE had been a close reader of advertisements published in the effort to overcome the damage done to the movement by the North Philadelphia Manufacturers' Association—a work now being carried on by the Anti-Sesquicentennial League—he might have been interested in a message to the people of Philadelphia signed by Albert M. Greenfield. Jules Mastbaum, now the most active spokesman for the exposition, is the largest real estate dealer in Philadelphia in addition to being head of the Stanley Company of America. But Greenfield is the largest real estate speculator. He got his start during the war-time boom in realty. Greenfield was not exactly listed among leading citizens, in spite of the advertising given some of his deals. But for some reason he became deeply interested in the exposition project last September, when it was showing all the signs of going on the rocks.

Accordingly he caused to be inserted in the Philadelphia newspapers a display advertisement beginning with the announcement that President Harding had just set the seal of his approval on the fair.

"Philadelphians are not cowards, nor welchers," said Mr. Greenfield, the real estate speculator. "We see our goal and we are going steadfastly to it. Boost or be quiet. We must put aside personal viewpoints and opinions from now on. It is the hour to act. You can talk often and favorably about the Sesquicentennial and you can urge others to do the same. That will help a lot. You can encourage President D'Olier and his directors and you should cheer them on the great task they have set themselves. Their work is hard and wearing and will mean in most instances a personal sacrifice that few of us would really undertake. Hence, give them the best co-operation you can. Help your city by helping them.

But Where's the Cash?

"SOME of us can help in a financial way. I have already pledged $10,000 to a preliminary working fund. There are many other individuals or firms in this city that can do likewise—who should do likewise. I stand ready to do more.

"I am more than proud of Philadelphia and I want to see Philadelphia show the world through the Sesquicentennial the world progress that has been made in industry, the arts and science during the past 50 years.

"The Sesquicentennial will be worth every penny that it costs, no matter what it will cost. It will be a real and timely service to the world, a great act of national unselfishness like unto that other great achievement—the American Red Cross.

"Let us not disappoint President Harding."

Many of those who had been sincerely anxious to get things started developed a marked lack of interest, and some of them understood why William Potter, former minister to Italy, remarked, "I'm out of it and I'm glad I'm out," after his resignation somewhat earlier. Nobody was surprised when E. T. Stotesbury and former Governor Edwin S. Stuart resigned.

It is interesting, however, to inquire a little into the pledge of $10,000 to the preliminary working fund. In the preceding article it was explained how the scope of the exposition was reduced to a point where the advisory committee believes it will be possible to go ahead for $15,000,000, as compared to estimates of $40,000,000 at the outset. These sums, of course, do not include many millions to be spent by the city on public improvements, some of which are already launched, and all of which would fit into the exposition scheme and could be used by such a fair. The new plan was hatched early this year and carried to the city council for approval—which it did not get.

Just $25,000 Contributed

VICTOR ROSEWATER, the secretary of the Exposition Association, was questioned after the directors had failed to explain how they were going to raise all the money. They wanted council to begin the condemnation of land, and also to make appropriations under a pledge of city support up to $5,000,000, made last year but not carrying any appropriation. The councilmen wanted to know how much money the association had been able to raise, in the nearly two years of its existence. Mr. Rosewater said it was $25,000. But he admitted that it was "not all in cash." The bulk of it came from $10 subscriptions made by private citizens of more or less limited means who were heartily in favor of the exposition before the inflation of real estate prices began to pinch them.

The fact is that Mr. Greenfield's pledge has not been paid to the association. Apparently it had a string to it—like that of the late Jacob Gimbel. Mr. Gimbel was the head of department stores in Philadelphia and New York, both of which could be expected to profit enormously by the exposition—which in its early planning stages was expected to bring 40,000,000 visitors to the city. He announced during one of the many lulls in interest that he would give $20,000 to the exposition fund if 100 other Philadelphians would each give an equal amount. Of course, the others could not be found, and nothing happened.

The pressure that has been brought to bear by the frantic money seekers has not been without amusing side lights. For instance, United States Senator George Wharton Pepper made the suggestion that, instead of a world-wide exposition of the products and fine arts of all nations, Philadelphia hold a sort of street carnival with circus features. The exposition of goods could be made a part of that along one street, according to his plan. But the manufacturers who organized the movement to balk the speculators in real estate do not seem to be interested in the display of goods. They have suggested a patriotic celebration to continue for several weeks; a celebration confined to patriotic pageants and with no hint of the commercial. That stand, incidentally, effectually destroyed the argument of the speculators that the manufacturers opposed the scheme "for business reasons."

As a matter of fact, they were quite right. The business interests in Philadelphia as well as elsewhere have had about all the inflated prices they care to stand. Conservative firms may have known it all along, but the others learned during the war that inflated prices do not mean increased profits, but the opposite. A study of the effects of earlier world's fairs held in other cities shows that the exposition itself is always marked by inflation, booms in real estate values, exorbitant prices for food and clothing and similar burdens on the working man. It has shown also that such fairs are followed by periods of depression caused by the collapse of the boom. Not only is there a loss caused by over-population and consequent increase of unemployment, but taxes also are necessarily increased to make up the deficits always left as a legacy to the city holding the exposition. The case is stated as follows by the Anti-Sesquicentennial League:

The Case Against Fair

"AMONG the most numerous objections from citizens in general is the belief that the exposition as proposed will have the effect of increasing rents, which are still at war-boom level. There are many complaints of increases in rents where the proposed Sesquicentennial has been given as the reason therefor. Philadelphia has not yet caught up with the housing shortage occasioned by the war and there apparently has been no readjustment in regard to the rent situation. If rents are now being increased in the city under the pretense that higher real estate values created by the Sesquicentennial movement makes the increase necessary, it is reasonable to expect that in the event of an exposition the situation will become intolerable to the wage earner who must part with too large a proportion of his income for rents. He in turn will be compelled to seek higher wages and thus another complication will be added to the labor question.

"There is still somewhat of a housing shortage in Philadelphia. In 1921 the city was behind 21,000 homes, the shortage resulting from war activities. For the city to keep pace with the normal increase in population, which is approximately 35,000 a year, it is necessary to build 7,500 homes each year. In spite of unprecedented home-building activities during the past year, the shortage has not been overcome. There is a shortage of labor in the building trades. If work is begun on the great world's fair, it is inevitable that the workers in the building trades will be drawn to this activity which after all will be an intensive building operation and the home-building program will be suspended during the period of fair construction, while at the same time the population would be steadily increasing, augmented by the transient influx occasioned by the exposition."

No attempt has been made by the speculators or by those members of the association who are not identified with real estate firms to answer the foregoing and other arguments. For instance, the real estate dealers cannot answer the question as to where Philadelphia is to get enough water for a world's fair. They know that even with its existing population the city is forced to filter water from the Schuylkill River that is full of sewage when it is taken into the filter plants; that even with the best filtration equipment it is necessary to use chemicals in the water when the river is low. A project has been under consideration for some years to bring water from the pure mountain streams north of the city, but the lowest estimated cost is some $70,000,000.

Little Enthusiasm for Exposition

IT IS pointed out by the opposition also as an obvious proof that there is little general enthusiasm over the proposed fair, "that after nearly two years of corporate existence the Sesquicentennial Association can point to no definite step forward with regard to actual plans as distinguished from the more or less tentative outlines and studies that have been made public from time to time." The chief reason for that failure to act, of course, has been the inability to get some of the taxpayers' money for the private corporation. The indications now are that the corporation is not likely to get any such appropriation.

Still another phase of the project that has been overlooked by the speculators is that it is essentially an advertising venture. Individual manufacturers as well as the group interested in blocking the juggling of real estate prices have had careful studies made from that point of view. "It is not good business to enter into a great advertising venture without figuring the cost of failure as intelligently as the probable profits of success," says the North Philadelphia Manufacturers' Association. "What will it mean to the prestige of Philadelphia if the exposition is a failure? The benefits that Philadelphia might derive from an advertising point of view are extremely doubtful. The idea that people would return to their homes extolling the virtues of Philadelphia is erroneous. It is more likely, in view of actual conditions as they exist today and as they will exist in 1926, that the majority of the visitors will go away carrying with them only the remembrance of inadequate accommodations, profiteering, congested living conditions and other discomforts."

Many Doomed to Losses

UNQUESTIONABLY, many speculators who went into the business of inflating real estate prices are doomed to bankruptcy. Financial interests alone now opposed to the exposition make it certain that it cannot be built on the scale originally planned. For some weeks the association has been trying to get the Fairmount Park Commission to turn over the territory along the Parkway and in the park suggested in the original report as part of the site. So far no action has been taken. If the real estate gamblers were sure that some day the exposition would be built it might be possible for them to get more funds, by sacrificing some of their paper profits, to carry their options indefinitely. But with no such assurance every day of delay not only adds to the expense but also makes it more difficult to get financing. Some options already have been forfeited.

Many men now most deeply interested in the price of real estate were participants in the false boom of after-war days, when approximately 2,000 newly built homes were held off the market at inflated prices. The speculators could not believe that the buyers had really called a strike. When they did start to cut prices it was too late, and many then went to the wall. Tremendous financial losses were suffered by others. What is beginning to happen now in Philadelphia is therefore only another object lesson to the speculator who deals in the necessities of life. It explains why many leading citizens who have not taken a stand openly against the exposition for business reasons are nevertheless making no secret of their amusement at the frantic efforts of the speculators to get something done.

The "Night of Power" in St. Sophia

Concluded from page 3

guard at the doorway, one on each side, on the raised stone threshold, so that they were higher up than those on the porch and they also overlooked the floor of the mosque. We all crowded up to the door as closely as we could to escape the storm, while our effendi conversed in Turkish with a guard. The Sultan was present, so he informed us, and no foreigners would be admitted; not even Moslem women were to be allowed in the porches or galleries.

Presently came an officer resplendent in uniform, gold braid, buttons, sword and boots. He was so sorry, but we could not enter by this doorway. This was not the proper entrance for Europeans. If we would go to the proper entrance undoubtedly we would be admitted, and he waved his arm vaguely to the south meanwhile escorting us to the outside.

So we passed on under waterpipes which spouted torrents of water on us, to the next portico, also guarded by two soldiers; they would not even admit us to the shelter of the porch; also they were very sorry but the next entrance would be the one for us. This one surely was not. They had orders to admit no foreigner. So on we went, sharp flashes of lightning showing us the massive walls and towers of St. Sophia, the kiosks of the tombs of former Sultans, and the slippery stones of the pavement and the deep puddles over which we splashed. The next doorway was on the south side of the mosque and was covered with a wide and open porch. As we started to walk up the passageway toward it, a white turbaned priest arose from the crowd of worshipers kneeling there, and leaning over the railing he screamed at us, in no gentle voice, "Yok, yok, yok, yok" (No). We hesitated. The gentleman seemed to have no desire to make our acquaintance. Again he waved his arms as if in a frenzy, and motioning us away, he emitted a perfect volley of "yoks." We took the hint and continued our peregrinations.

The mosque of St. Sophia is no small thing and a walk around at night over slippery, uneven stones, in a violent thunderstorm is to be remembered. We went through devious passageways, along huge stone walls, and under trees to the eastern side of the mosque. Here we found a large entrance with a wide flight of stone steps going down directly into the mosque. Also there was a large number of soldiers on guard, and carriages and horses stood about. They took considerable interest in us at this entrance, asked to see our cards, passed them about, one to another, and did a great deal of talking. My husband, unfortunately, had no card of his own with him, but found one of an American business friend which answered all purposes. The lightning flashed, the thunder reverberated, and the water came down in torrents, so that even the guards were forced to withdraw more deeply into the shelter of the doorway. I, especially desiring not to get wet, descended three or four steps. No notice was taken of me. being only a woman, so I ventured down a little farther and, bending down, I found I could look through the lower open door to the floor of the mosque. This time the people faced me, standing, kneeling and prostrating themselves as the high-pitched chanting rose and fell, coming from the raised pulpit which was somewhere very near. For some time I stood there quite unnoticed while the guards discussed the question of our entrance vigorously with our guide.

All too soon for me, the soldiers' conference ended; one drew the hood of his cape over his cap and beckoned us to follow him. Out into the storm we went again, between carriages, under the noses of horses, around corners and finally down a long, open lane to another entrance. Here he turned us over to a black-frock-coated gentleman in a fez. We descended 10 or 12 steps into a small anteroom or hall. Here were a few Europeans, including the party from Roberts College with the Albanian. We presented such credentials as we had to the official, but they produced no effect. He looked at them, considered the matter, and finally said his orders were to admit no one. Our guide spoke angrily to the Albanian. "Why don't you do something to get these people in? Have you no friends here?"

The Albanian tossed his head and replied haughtily, "I have many, many friends. I am doing all I can."

The intoning came to us very faintly, only the highest notes sounding. All was quiet and dark, like a vault underground, lighted only by tiny dim oil lamps. Two white-robed priests in turbans guarded the door which would admit us to the gallery. It seemed quite hopeless. If it had not been for the storm outside we should have gone home at once, but here it was at least dry. The Albanian continued a low-toned conference with the official; then drawing his heavy cape around him, he ran up the steps two at a time and disappeared.

"Where is he going? What is it? Do you think we shall get in?" Everyone talked at once.

"The gentleman says" explained our guide, "that if the uncle of Redjdeb (the Albanian) who is a pasha in high standing, says we may enter, he will admit us." Then he added, "There is not one chance in a thousand that he can find him in this crowd."

We waited. Most of the other Europeans left. In about 15 minutes Redjdeb came back, and going straight to the official, spoke to him emphatically but evidently to some purpose. The official looked bewildered, almost dazed, and grudgingly consented to something. Turning to us, Redjdeb said, "He says the ladies may enter, just the ladies."

"Quick, quick," said our Albanian, "come this way, perhaps we may see the Sultan."

On tiptoe we scurried to the front of the gallery. Bending down we could look between the latticework sides and the roof of the kiosk into a small room in which were standing several gentlemen in fezzes and frock coats. Possibly one was the Sultan, more probably not.

At one side of the front was the golden shrine which held the Koran and upon the same side but farther back was the pulpit. Forward there was a large platform with a railing around it, raised on arches about 10 feet from the floor. Seated cross-legged on this platform were two dozen or more turbaned priests; several others sat upon a divan against the wall. On the opposite side were two smaller pulpits also containing priests, and from these three pulpits came the chanting which we had heard. It seemed to pass from one pulpit to another, swelling forth and then dying away almost to a sigh. The people rose and fell as if moved by one mechanism. Outside the storm raged. With my elbows on the wide marble railing of the gallery I leaned over as far as I could. I was alone. The others had gone to the far end where there is a raised platform with seats for visitors. Down there, where all those thousands were kneeling, once upon a time knelt Christians, once this had been a Christian church; and those very floors had been wet with Christian blood when, so many hundred years ago, the people took sanctuary in St. Sophia to escape the Moslem horde. But not even the walls of St. Sophia, strong as they were, could protect them. It is said that Mohammed rode in on their dead bodies, and struck his sword high up on one of the marble pillars, taking the church for his followers.

The chanting was taken up now by the people, a low solemn murmur, and then it was all over. The priests came down from pulpits and mingled with the people, gathering them together in groups, preaching to them and teaching them. The whole floor of the mosque was a moving mass of humanity. This preaching lasts all night. As the last boat for Hissar would leave at 10 o'clock we thought it best to go. As we were unwinding ourselves down the inclined passageway, someone asked Redjdeb what it was he had said to the official at the door that influenced him to let us in.

In his quaint English he answered, "I said, 'You see all these Americans. They are my friends. You are keeping them waiting. You know who my uncle is? Yes? Well, then, if you do not let them in tomorrow I shall tell my uncle and he will have you punished.' "

And the fact that he could have done so, and that the official might have been punished for not disobeying orders was confirmed by others who knew the ways of Turkish officialdom. Poor man, what a dilemma to have been in.

A carriage again to the bridge, and soon we were packed in a crowd on the boat and started for home. As we floated out into the darkness of the harbor we were entertained with magnificent fireworks; skyrockets, bombs, Greek fire, and big Roman candles and Roman mines illumined the whole of the Golden Horn and adjacent Bosphorus. A young Turk, who had celebrated the "Night of Power" too powerfully, sang a plaintive Turkish ditty into my ear for nearly half the way home, much to the amusement of his two companions. The point of his tale was entirely lost on me, however, as I could not understand a word.

It was a wet, bedraggled party that left the boat at Hissar to climb the hill to the big house at the top, but we all agreed that we felt well repaid for the effort, and for the privilege of seeing the celebration of the "Night of Power" in St. Sophia.

Gives Up Her Life to Establish Sacred Drama

Concluded from page 9

tator's heart than has the message of a thousand sermons. Without this wise selection of scenes and discriminating emphasis of incidents the play would have been a failure instead of the great success it is today.

But with all the mingled idealism and dramatic power which these aspects of the play indicate, Mrs. Stevenson possessed the ability to make her dreams practical. In all the world there is no equal to the Pilgrimage Theater in the canyon back of Mrs. Stevenson's Hollywood home. Stage managers from all parts of the country have visited it behind scenes and marveled. To keep the play simple and yet make it profoundly impressive this woman added to her self-appointed task many of the technical problems of the stage manager. To provide appropriate music for the play a pipe organ especially designed for this setting was built far up on the hillside above the stage and housed in what appears to the audience to be a Palestinian dwelling. Instead of employing elaborate stage settings with drop curtains, wings and flies, the hillside itself is relied on chiefly to afford a background for the 10 scenes, prologue and epilogue.

But there is no monotony from the moment the great curtains part revealing the familiar Bethlehem scene until the epilogue when the Voice proclaims, "Lo, I am with you alway, even unto the end of the world." The variety and sustained interest are greatly enhanced by a lighting system far more elaborate than is found in most outdoor theaters. For example, owing to the area of the mountainside rising behind the stage and requiring illumination in certain scenes, two banks of 20 reflector lights each are installed some 50 feet above the stage. Where Christ, mounted on an ass, and followed by the multitude, is shown outside the city of Samaria, this natural background of chaparral-covered mountainside is used with powerful effect. Again, in a remarkable scene telling of the crucifixion by suggestion rather than action, the stage is left completely dark while a strong beam of light illuminates three white crosses set so high up that they are silhouetted against the starlit sky.

The present dressing rooms for the actors consist of little cabins concealed from the view of the audience dotting the hollows in the mountainside behind the stage. Owing to the remoteness of some of these from the footlights the distance which many of the actors have to travel on foot totals several miles each night. This was one of the considerations prompting the construction of a tunnel and new dressing quarters.

In the matter of correct costuming and faithful reproduction of the settings of Christ's time the play is a marvelous achievement. Mrs. Stevenson did not believe in depicting an idealized Christ. She sought above all else to portray Him as He lived and moved among the people of His day. Most of the best sources of historic data were studied by her with the greatest care, after which she made a journey to Palestine especially to learn first hand about the costumes and customs of the people. Her investigations were by no means confined to the beaten paths followed by tourists, but included byways where survive to this day many of the customs of the first Christian century and earlier.

It seems a far call from these material details to a divinely inspiring presentation of such a scene as the Last Supper. But Mrs. Stevenson's devotion enabled her to bridge the chasm between the ideal and the practical. The result has been a series of living pictures, marvelous as to composition and exquisite in coloring. But never is the artistic interest allowed to overshadow the message. "As a disciple in the play," wrote one of the players to Mrs. Stevenson not long ago, "I wish to say that it is one of the best opportunities for growth that I have ever experienced. But the greatest blessing of all is to be night after night and week after week at the Lord's Supper. Well, all I can say is that the play has meant *Life* for me these three summers."

The great all-compelling purpose of this woman was to get man's thoughts back to the wonderful story of the Christ, or to be more accurate, to get mankind back to the *life* of Christ. If she had theories or tenets regarding her personal interpretation of that life, she never obtruded them upon the public. After diligent inquiry among her friends and admirers I have yet to learn to what denomination or sect, if any, she belonged. She was consumed with one idea—to let men and women of today see for themselves what Jesus did and said among men. Such an experience, she said, would do more than all other agencies combined to bring the suffering world to a right relationship with itself.

It seems almost a supreme tragedy that the originator of this fine conception which promised so much for America and the world, should have died at the very beginning of its realization, particularly as she left no will and consequently no legal provision for carrying forward her ideal. However, it may be better so. It has raised the question, "Will the people continue the play?" This challenge which is now facing Hollywood is quite typical of the one which comes to a community from time to time. Mrs. Stevenson is typical of outstanding individuals in many towns and cities who would like to do something splendid for their fellow men. Sooner or later the question arises, "Have the people vision enough adequately to support such leaders?" It is possible, though not probable, that Hollywood will fail to realize its great opportunity just as occasionally other communities have failed in matters involving public spirit. The situation is one which other communities may well consider, not only because of the elements of special interest surrounding the Pilgrimage Play, but because it illustrates the need of popular support for every worthy public project. No community has a right to sit back and let a few persons of vision and means do something for it.

Wendell Phillips Flayed "Crimes of Capital"

Wall Street Needed Honest Finance, Great Abolitionist Declared

By JOHN BASIL BARNHILL

WENDELL PHILLIPS, alone, of all the leaders of the Abolition movement, recognized the overshadowing importance of the Money question. His perception of this fact and his determination to act upon it was the bravest thing he ever did, for it meant separation from all his old colleagues and, in many cases, the actual loss of their friendship. Even Garrison was blind to the importance of the Money question. Phillips, alone, of the Abolitionists, "obeyed the voice at eve, obeyed at prime."

One of Phillips' greatest speeches, his speech in support of General Benjamin F. Butler, Greenback candidate for governor of Massachusetts, *is not in any collected edition of his speeches—perhaps it dealt with the money question too frankly.* This speech and other utterances of Phillips on the Money question are herewith reproduced for the benefit of our readers.

Given at Salisbury Beach Gathering, September 13, 1871.

"Fellow Citizens: General Butler has told you this was a gathering, on the seaside, of all parties and all classes of men; and that he hoped his remarks would not offend the prejudices of any class or of any party. Gentlemen, I recognize, as he does, the duty we owe to the harmony of the occasion; but if I thought, fellow citizens, that I should leave Salisbury Beach without treading on somebody's toes, I should regret I ever came here. What is the use of a thousand men meeting together to compare notes—to exchange ideas one with the other—if we do not leave, after we separate, some hint, some seed, some suggestion, that will bear fruit—that will clear up the doubts, cut away the underbrush, and enable men to see more clearly and act more nobly? I came here on purpose to offend your prejudices; I did not come for any other reason; because, fellow citizens, if you stood here, and I was one of the crowd now before me, I should hope that you would drop some salt, or endeavor to stir the waters of the public mind, for the health and life of us all.

"This is an old festival. It has been held for a century or more, and it is not out of place, therefore, to say a word of the far past. I say New England gave only three great men to the Revolution—marvelously great men. One was Benjamin Franklin, the second was Samuel Adams, and the third was Nathaniel Greene, of Rhode Island. These are the three *great* men that New England lent the Revolution, and there is no name in all our history that deserves to be named in the same week with these three. After them, at a long interval, comes your own Timothy Pickering, a pure, able statesman; and by *his* side stands Jonathan Trumbull. of Connecticut—the man who gave rise to the phrase "Brother Jonathan"; for when Washington doubted what to do, it is said the wise old Virginian used to stop and say, 'Ask Brother Jonathan.' . . . .

"The only value any public man has, in my eyes, is the aid he aims, or is able, to give toward lifting off the unnecessary burdens of society, remodeling what is unjust, remedying what is defective, and raising the mass of mankind to greater comfort, wisdom and virtue . . . . This great country, its material interests presenting new questions every hour, rocking with social convulsions, teeming with men and forces that struggle for a place to mold the age and benefit the world—such a country is no cabinet chamber where laureled men scramble for office. It is the field where the tools ever offer themselves to him who can use them; and where, *through* respected and accepted men, or *over* them, the work of the hour *must be done.*

"The trouble with all political parties is that they linger on the stage long after we need them. Although 'the brains are out, the party won't die.' . . . . We protected the *black* laborer, and now we are going to protect the laborer, North and South; labor everywhere. Gentlemen, the question for the next 10 years is the relation of labor to capital.

"The Financial Sponge"

"YOU think, when I have stated the question so, that I mean the question between the man that earns two dollars a day and the man who earns sixty millions; that is not the question. The meaning of the labor question in Europe and in this country is this: Whether you on these acres, on yonder waves, or in the mills, shall work honestly, industriously, soberly, for 70 long years and then die worth a thousand or two thousand dollars, a small house, 40 acres of land, or nothing, while some financial sponge sucks up millions.

"I find no fault that Vanderbilt is worth 50 millions of dollars; I find no fault that Stewart is worth one hundred millions of dollars. What I say is this: that this system of finance by which one man at 60 years old has gathered fifty millions of dollars, and of the ten thousand men that work for him, seven thousand get up every morning not knowing where dinner is coming from—that system of finance belongs to the bottomless pit and the sooner it goes home the better.

"I do not blame anybody; but I am determined, as far as I am concerned, that the brains of this generation shall try to tear that system open and let the light into it, and the readiest way I know is by political action . . . .

"I have given 30 years of my life—and I rejoice to have been permitted to give them—to the redemption of a race. If I am spared another 10 years, I hope I shall be permitted to give them to the redemption of every man who works with his hands. (Applause.) For, Gentlemen, **the great danger that threatens us in the future is the money power. . . .** The real question is, whether you will have a republic or whether you won't. I confess that I have studied democratic institutions for 40 years and I don't see, today, the means by which the independence of the legislature of Massachusetts is to be saved from the hands of its capital and corporations . . . .

> *"Let those who say Wendell Phillips did not understand Labor and Capital," said Joseph Cook, "wait 50 years until Macaulay's Huns and Vandals appear on this continent, and then ask whether he understood the necessities of the case."*

"The great question of the future is money against legislation. My friends, you and I shall be in our graves long before that battle is ended; and unless our children have more patience and courage than saved this country from slavery, republican institutions will go down before moneyed corporations . . . . Now that the slave question is settled, this great question will fill the arena.

"There is no antagonism between Man and Money—between Capital and Labor; they are friends, not foes; partners, not competitors; they are the two parts of one scissors—each useless without the other. Whatever harms or helps one, must, on any just system, harm or help the other. I demand that the men who have lifted unpaid labor (the slaves) into the ranks of paid labor shall now spread their protecting influence over all labor, white and black, from the Lakes down to the Gulf. Then we shall have a new era, in which we will cut the hamstrings of capital, undermine the tyranny of corporation, and restore legislatures to their independence. We fight to unchain legislatures.

"Money Mongers the Thieves"

"GENTLEMEN, this is not my battle. I see many a man here as old as I am. It is not his battle. We have done our duty . . . . But, I can tell you, without any reference to this election, you men of 40, you have a keener battle to fight; you have a harder 30 years to face than we faced . . . . I would like to find a man outside the Worcester Insane Asylum who believes, even when he is asleep, that the legislature of Massachusetts has got courage enough to do anything which the National banks of this commonwealth forbid. In my mind's eye I see all of you, children of Republican fathers, you all come up here and think you are free men. My dear friends, there is not one of you that has not a National Bank bill pasted over your mouth. (A voice, 'I hain't.') Well, that only shows that he has got three—one over his eyes, another over his ears, and a third over his mouth.

"The money kings and coin mongers of London and New York are the thieves. Watchful and keen, they saw at the end of the war that our bonds were the best investment in the world; and that our finances could be most easily wrenched to make the rich richer and to crush the poor into slavery. Joining in conspiracy, and shutting Boston and Philadelphia out of the scheme, they proceeded to derange our currency—demonetize silver—and to change the basis and conditions of our bonds so as to double their own wealth and double the weight of our national debt, leading our obsolete financiers, wise in their own conceit, a fool's chase . . . .

"But is God dead? Have seed time and harvest failed? Has the hand of man lost its cunning? Does this blight cover the whole world? No; there is a nation which a merciless foe has just trampled in the dust, eating up and carrying off its garnered wealth. Exhausted with this foreign drain, civil war is eating out her strength. Angry parties stand ready to fly at each other's throats.

"By all the rules that obsolete political economy prates and babbles about, the people of such a nation ought to be starving. Her ships idle, her granaries empty, her trade annihilated. Not so!

"That nation is France. France has just paid Germany one billion dollars. Her chief cities have been sacked and plundered—humiliated by defeat, torn by civil dissensions, she laughs, while all the rest of Christendom wades through the mire of bankruptcy. Her ships are full busy: and what little other nations do, is in carrying to and fro her manufactures. Her homes are happy, her streets crowded with passing trains laden with goods; all her mills hurrying night and day, to get even with the demand upon them. Labor walks rejoicing, and capital sleeps easy, fat with its gains.

"What magician has done this? Paper money. Like the rest of the nations she ran to its protection during the stress and storm of her war with Germany. Unlike and wiser than the rest of us, she has not hurried back to coin. Wiser than we, she received the paper that she offered to others. That honesty has its reward. Her paper today is more valuable than gold, and she strides valiantly forward in her path to wealth and peace, spite of all drawbacks. Now if fanaticism is feeling without facts, and wisdom means facts governing theories, which party are the fanatics, and which are the wise men?

"A Thousand Million Stolen"

"THE night before Charles Sumner left Boston for Washington the last time, he said to me, 'I have one thing more to do for the Negro—to carry the Civil Rights Bill; and after that is passed I shall be at liberty to take up the question of Labor."

"I say, let the debts of the country be paid, and let the government lend every Illinois farmer (if he wants it) who is now borrowing money at 10 per cent, money on the half-value of his land at three per cent. The same policy that gave a million acres to the Pacific Railroad, because it was a great national effort, will allow of our lending Chicago twenty millions of money, to rebuild it."

When Wendell Phillips was making an effort below par, the Abolitionists would say, "We must hiss him—that will bring out the divine spark." Opposition, indeed, always brought out the best that was in Phillips and he never spoke with more effect than when, addressing the bluest blood of the intellectual aristocrats of Boston, he proclaimed full in the face of their derogatory smiles and ill-concealed contempt, the undiluted gospel of money. He spoke as follows:

"For this Money question only means whether we shall trust the Declaration of Independence—that all men are equal in money matters, as in everything else. Hitherto we have been Tories in money matters, and trusted the people only in other matters. July 4, 1776, said: 'The sober second thought of the *people* is the safest and best guide in all civil affairs—personal rights, property, marriage, crimes and all. And we can devise machinery which will secure that sober second thought.'

"We have been living successfully and prosperously for a hundred years on that plan and platform, with one exception—money matters.

"The people will now carry the Declaration of Independence into Wall Street, where it has never yet penetrated, and we shall have a more honest finance than the world has yet seen.

"We have been called the most dishonest nation in the world but we are not the most dishonest *nation.* Perhaps ours has been of late as dishonest an administration as the world often sees (he was speaking about 1868). This is not the fault of the masses . . . . Three times within a dozen years, capitalists, with their knives on the throat of the government, have compelled it to cheat its own creditor, the people, whose claim, Burke said, was the most sacred. First, the pledge that greenbacks should be exchangeable with bonds was broken. Secondly, debts originally payable in paper, as Sherman confessed in the Senate, were made payable in coin. Thirdly, silver was demonetized and gold made the only tender. *A thousand million dollars were thus stolen from the people.* These are the crimes of capital: the people are honest enough, if left to themselves."

"Many Houses, Few Homes" Says Irving Bacheller

Concluded from page 7

few homes, and I am almost persuaded that business has ousted the old-time pride in rearing the young. The master of the home has been exchanged for a parent with a thirst for gold, with the young speaking in contempt of old moralities.

"What is needed is intense, not broad, vision. You can learn more truth in a 10-acre plot than in rushing around the globe, where you can gather but surface impressions. Now we have become a nation of fun chasers, a condition that is sapping the foundations of home life. Business may fail without loss of credit, but when a man's home fails there is no more pitiable bankrupt in all the world."

"Commercialism is the thing which is mainly the matter with the world. The desire to make money has caused many of us to forget the main thing which is—making men and women out of boys and girls. The temptations offered by commerce are attracting the best of the young men and women from the learned professions to those which pay better. They are breaking down the standards of the church, the school and the home."

Irving Bacheller is a Niagara of a man. More than 60 years has not robbed him of his boyish smile. Often he goes on the lecture platform, speaking before clubs and literary organizations. He is a pleasant, refreshing entertainer, who always has something to say, which he does in a way both characteristic and crystal clear. As a word phraser he can be as swift and descriptive as a cartoonist.

Much of his writing is now done at his home, "The Gate o' the Isles," in Florida. The early mornings are the time for his work. He is interested in golf and billiards, and he thinks the latter is one of the few games for which he really has a gift.

"If it had been cultivated in my youth, I do not know what might have come of it," he remarked half-boastingly in telling of his joy in the game.

"My home—let it be where I may know the ancient hospitalities of nature—its lavish appeal to me in color, sound, shadow and fragrance—the companionship of its trees and of the little wild people that inhabit them," was the tribute paid by the author. "Let me look far from its lawns and windows over green slopes and shining waters. Above all let me see the ever-changing plans of some quiet bay leading out to the seven seas and filling, at sunset, with the shadows of sails and islands, and the glory of the evening sky, and, later, with the gold of moon and star and lantern light."

Minnehaha—Twelve Years Ago and Now

Beauty Spot Immortalized by Longfellow Is Fast Disappearing

MINNEHAHA Falls, world-famous beauty spot of the Northwest, is rapidly disappearing and like the Indians that named it will soon be but a memory, as parched as the shifting sands of desert wastes. Civilization has been hacking at the source of the stream and unless steps are taken to save it, the falls will be entirely dry within 25 years, it is believed. Wealthy in tradition and rich in scenic beauty, Minnehaha Falls now is but a skeleton of its former self. A few years ago a rolling mass of water swept over the brink and hurled itself in noisy abandon against the crags below, while today there is only an insignificant thread trickling down and the joyous roar of the cataract has ebbed to a pitiful echo.

There is probably no point in the United States that is more generally known than Minnehaha Falls, immortalized as it was by Henry Wadsworth Longfellow in his poem, “Hiawatha,” and every school child has at some time dreamed of the picture of Hiawatha, wooing his sweetheart, Minnehaha, at that shrine of romance in the heart of the forest. And each year thousands of tourists visit Minnehaha Park. The rocks of the gorge for hundreds of feet below the falls are a huge register of names, carved and scrawled by those who have visited the scene.

The history of Minnehaha Falls is a fascinating page in the development of the Northwest. Although there is no record of the discoverer of the falls, it has been learned that in the early days it was known as Little Falls and Brown’s Falls. The Indians referred to all cataracts as “haha” or laughing water and at one time this term was applied to St. Anthony Falls, a cataract a few miles north on the Mississippi River.

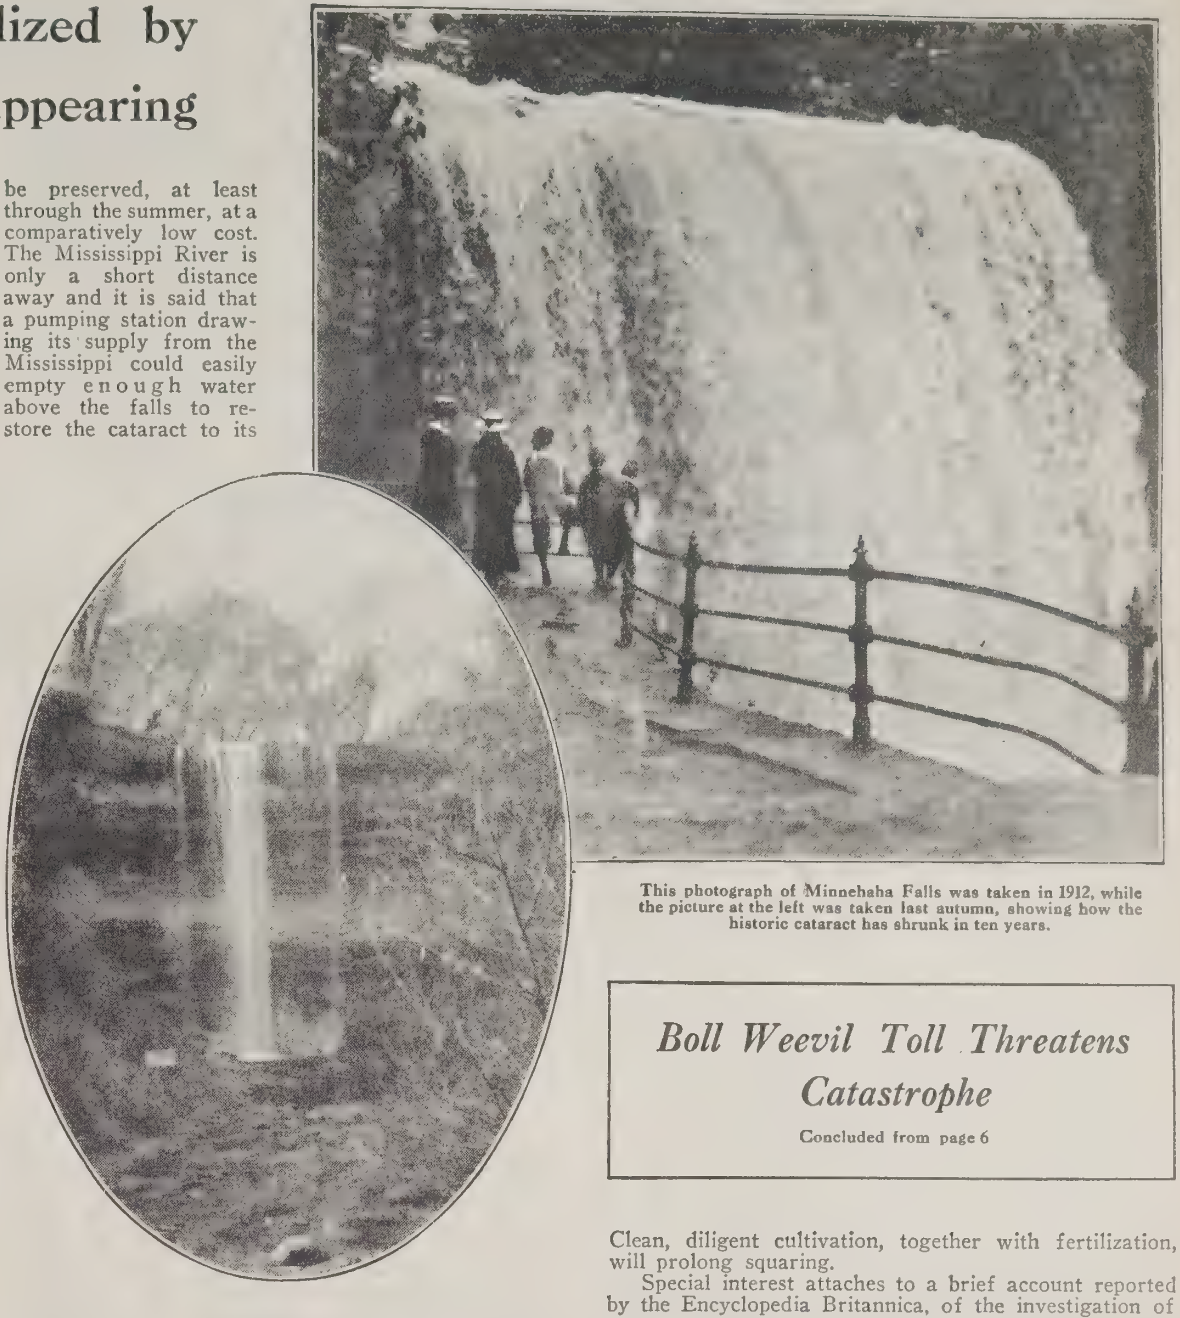
In a history of Minnesota it is said that Longfellow never saw Minnehaha Falls, but wrote Hiawatha from a description given him by an eastern Senator, Charles Sumner, who visited the falls in 1855 and was so much impressed by the beauty of the scene that he told Longfellow of its charm.

The poem is credited with the making of Minnesota, which up until that time was little heard of.

Minnehaha Falls, which is in Minneapolis, is fed by a stream that serves as an outlet for Lake Minnetonka. In the past few years the district adjacent to Lake Minnetonka has been built up with the result that the swamps which formerly fed the lake have been destroyed and virtually the only water now flowing into the lake is that coming from a few small springs.

Minnehaha Falls is 54 feet high and 36 feet wide. A few years ago a layer of water more than a foot deep rolled over the brink while now the stream is only four or five feet wide and not much more than an inch in depth.

A movement is being discussed by which the falls could be preserved, at least through the summer, at a comparatively low cost. The Mississippi River is only a short distance away and it is said that a pumping station drawing its supply from the Mississippi could easily empty enough water above the falls to restore the cataract to its former size. It is pointed out that money brought in by tourist traffic which the falls attracts would more than offset the expense.



This photograph of Minnehaha Falls was taken in 1912, while the picture at the left was taken last autumn, showing how the historic cataract has shrunk in ten years.

Arbor Day—Its Observance and Growth in Popularity

By FRANK DORRANCE HOPLEY

WHAT Christmas is to the religionist, Independence Day to the patriot, Arbor Day is to all those who rejoice in the beauty of the trees, and who desire that the roads, and streets, and parks of the cities and villages of the United States shall be made beautiful with Nature’s handiwork, and that the economic supply of timber in the forests of the country shall be preserved and rehabilitated.

It is now 51 years since the first Arbor Day was observed. Nebraska was the pioneer. It was at a meeting of the State Board of Agriculture, held at Lincoln in January, 1872, that J. Sterling Morton introduced a resolution to the effect that “The tenth day of April, 1872, be especially set apart and consecrated for tree planting in Nebraska.”

Tree planting was no new thing in that state when the Arbor Day plan was proposed by Mr. Morton, for a lack of trees had proved to be a serious drawback to the first settlers, as Nebraska was at one time practically a treeless state. Protection for the orchards, crops and buildings, from the winds that swept unhindered over that flat country, was imperative, and every farmer needed wood and fence posts. An attempt had been made to supply this deficiency, but the planting of trees had, up to that time, been in a haphazard manner.

Arbor Day was, therefore, taken up with great popular enthusiasm and, during the quarter of a century that has elasped since its first observance, more than 700,000 acres of land, containing nearly 1,000,000,000 trees, have been planted in Nebraska.

The idea of planting trees upon a particular day, however, was somewhat slow to find favor in the other states. Kansas and Tennessee did not follow the lead of Nebraska until 1875, and it was another year before Minnesota fell into line. It was not until 1882 that Ohio and North Dakota proclaimed an Arbor Day of their own.

Since that time, the plan has been gradually adopted by other states until, at present, nearly every state in the Union has its day set apart for the planting of trees, usually during the month of April, with appropriate exercises by schools and civic clubs.

Nor has the idea of Arbor Day been confined to the borders of the United States. In 1887 the educational department of Ontario set aside the first Friday in May as a tree and flower planting day. In 1896 the plan was officially adopted in Spain. In 1905 Hawaii fell into line, and at the present time Arbor Day is observed in all the dependencies of the United States, and in Great Britain, Canada, Australia, the English West Indies, South Africa, China, France, New Zealand, Russia, Norway and Japan.

L. C. Everard in his circular on Arbor Day, issued by the United States Department of Agriculture, strikes the keynote of the observance of the day when he says:

> “The yearly planting of trees, accompanied by appropriate exercises, serves to keep the people continually reminded of the value and necessity of the work of the foresters; and they have such a far-reaching effect on the community spirit and through that on economic and social betterment, that no community can afford to neglect Arbor Day.
>
> “A clean and beautiful town is a source of pride to its citizens and constant incentive to them to go on and do better. A slovenly town is apt to mean slovenly inhabitants. The celebration of Arbor Day may very well be the turning point in the attitude of a community toward its civic duties and by consequence toward its social life and its manner of conducting business. Nothing so helps to beautify a city or town as trees, and few things so educate the people in public spirit and foresight as the care of trees.
>
> “The greatest value of Arbor Day lies in its effect upon our attitude toward the trees that are already growing; for manifestly there are thousands of trees of natural origin to every one planted by man. The average citizen is only now beginning to realize the necessity for taking care of these trees, having never before considered that they needed any care.”

The late Joyce Kilmer, writer, poet and soldier, in his immortal poem on “Trees,” closes with the couplet:

“Poems are made by fools like me,
But only God can make a tree.”

Boll Weevil Toll Threatens Catastrophe

Concluded from page 6

Clean, diligent cultivation, together with fertilization, will prolong squaring.

Special interest attaches to a brief account reported by the Encyclopedia Britannica, of the investigation of an agent of the United States Department of Agriculture, in Guatemala, where cotton was found successfully growing in the face of an abundance of weevils. The cotton buds, after being punctured by weevils and eggs laid, did not fall off, as in this country, but a special growth of tissue inside the bud enveloped and killed the larva. All of which lends encouragement to the prospect that a type of cotton may be evolved in America that will likewise act in destroying the larva of the pest.

The next step in weevil control is to realize that cotton fields are breeding fields of the weevil, and to practice intensive cultivation. The result will bring a higher yield and greater acre profits. The growing scarcity of farm labor is compelling intensive farming. But the success of this system in cotton production depends largely upon an ample supply of fertilizer.

In a letter to the writer, the United States Bureau of Soils, Washington, said with reference to cotton soils: “It is undoubtedly much more economic to use fertilizer and increase the yield of the crop. For this reason, a source of cheap fertilizer would be of great importance to that section.”

The Bureau of Entomology, United States Department of Agriculture, knowing that the weevil consumes moisture on the cotton plant wherever it is found, has experimented for years in an endeavor to find a poison that would kill the weevil, without injuring the cotton plant. Such a poison has been found in calcium arsenate, dry powdered form. This poison will also kill other injurious insects to cotton, such as the bollworm.

The powder should be applied by dusting machinery, at night, when the plants are moist, five to seven pounds to the acre, four applications four days apart, repeating the schedule, if necessary. The cost of the poison and the dusting machinery is controlled, to an extent, by trusts, and is so high that the Bureau of Entomology recommends that powder be used on acreage capable of yielding one-half bale or more if weevil injury were eliminated.

W. D. Hunter, of the Bureau of Entomology, has carefully prepared an instructive circular on weevil habits and poisoning, which should be in the hands of every cotton farmer.

In summing up, the writer reaffirms the need of soil nitrification, early preparation of land, early planting of early maturing cotton; clean and intensive cultivation, quantity and quality of fertilizer, reasonable spacing of rows to permit sunlight; the use of calcium arsenate, if practicable, the burning of fallen squares, and getting busy in the autumn by plowing under cotton plants and cleaning up fields of all rubbish that offer hibernation quarters for the weevil.

Can the South beat the weevil? Yes, if mobilized as a determined unit to use intelligent, scientific methods of farming, and if furnished with the necessary fertilizer at low prices.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

There are no speeders in North Adams, Massachusetts. A policeman stands at the roadside with a red lantern or flag. Speeders are hailed and cautioned to use discretion. If the driver fails to slow down the policeman blows his whistle, and farther down the road a board filled with short spikes is stretched across the highway.

Six hundred million dollars' worth of silk products is manufactured in Paterson, New Jersey.

Japan will soon be independent for its supply of quicksilver. A rich vein, said to extend seven miles on the surface and to vary in width from two to six feet, has been discovered. The ore assays 18 per cent and the vein increases in thickness the deeper it is followed.

There is a scarcity of cats in Russian villages. During the famine many cats were eaten by the people. Now mice are devouring the grain.

A new scheme of intercommunication would link all Europe by telephone. An international conference will be called to consider the matter. Under the scheme it would be possible for the prime minister or financier in London to put in a call and get through to Vienna, Berlin, Rome or Madrid in half an hour.

A spot in Père Lachaise Cemetery, Paris, has been set aside for the bodies of all Belgian soldiers killed in France and the plot given to Belgium.

Butyn, a new drug, is a substitute for cocaine in dental and eye work and also in minor surgery. It is a synthetic product and it is said the anesthesia produced is more profound and prolonged than that produced by cocaine. It is not a derivative of cocaine and has no attractions for the drug taker.

Twenty years ago the *Frankfurter Zeitung* established a fund for the preservation of the grave of Heinrich Heine, the lyric poet, who lies buried in the cemetery of Montmarte, Paris. During the war the French saw that the grave never suffered to fall into neglect and now that the mark has fallen to nothing the German paper has written saying it would be impossible to continue the work. The French replied that the present state of affairs is unfortunate for everybody and that the grave will be cared for. If values are readjusted Germany will be the debtor. If not, the Germans will owe nothing.

Ten thousand Chinese soldiers guarding Tachienlu, the pass to Tibet, are having their clothes sewed on their bodies. Garment after garment of heavily padded cotton is sewed into place on the body to remain undisturbed until the suns of summer return. The pass is the coldest place on the border.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A Boston judge has refused the application of two persons, one named Sorocovech and the other Papkevitz, to change their names to Stone and Parker because he does not approve such changes when they tend to conceal the race and origin of the applicants. They took the names Popkin and Soroco.

The king of Siam has translated *Romeo and Juliet* into Siamese and has issued the play with notes, mostly on the rendering of English idiomatic phrases.

A promising parasite has been found for the control of the Mexican bean beetle, which is rapidly spreading in the southern states. This parasite preys upon at least two species of the genus to which the bean beetle belongs. Also there has been found in Mexico two varieties of beans which show promise of resistance to the injurious attack of the bean beetle. One is a native white bean and the other a wild brown bean, the latter growing very abundantly along streams in Southern Mexico.

An army aviators' map embodying a comprehensive survey of all mountains and valleys of the Pacific Coast has been completed. It is believed that this map will permit aviators to determine their positions in territory wholly unfamiliar to them.

Far up in the mountains at the head of American Fork Canyon, Utah, two men and a woman were marooned and starving in a mine cabin. Heavy snows had cut off the two miners and the woman from civilization. An air mail service plane was sent to the rescue. The pilot circled over the cabin and dropped a package of supplies sufficient to maintain the party until they can get out to civilization.

The Negro population is said to be migrating northward in such numbers as to endanger the effort to raise a large crop of cotton.

Mustapha Kemal Pasha, at a mass meeting in Smyrna, said, "The project of the Allies is unacceptable for a nation which wants complete independence, because we possess both the title to independence and the power to attain it. If we must expire as a nation in the course of 40 years, we had better die now with an open heart and conscience. History will then remember us with honor and esteem."

The longest ski-slide in the world is in Oberhof, Thuringia. It is 60 miles in length and the course is laid out on an old road winding through the hills of the Thuringian forest.

Serious consideration is being given to the construction of a new interoceanic canal, either at Panama or by the Nicaragua route. The Panama Canal cost in round numbers $400,000,000. The gross revenue for the fiscal year of 1922 was $11,197,000. In six years the canal has increased its business almost 300 per cent and it is increasing yearly.

For every marriage in Denver in 1922 there was a separation. For every two marriage licenses there has been a divorce suit filed, according to Judge Ben B. Lindsey. He states that in the last four years the marriage and divorce rate has changed from four to one to two to one.

Until recently the Codex Vaticanus, so called because it is kept in the library of the Vatican in Rome, was the oldest Bible manuscript. Now, however, is found in Egypt an older Bible manuscript, containing the apostolic epistles, the prophecies of Jonah, and the fifth book of Moses. The manuscript is written in the Coptic tongue and consists of 109 papyrus rolls. It is the oldest Bible manuscript in existence, dating from 360 B. C. It is in the library of the British Museum, for which it was bought at a high price.

The dreaded Hessian fly, which constantly threatens our wheat crop, entered the United States in some straw which the Hessian soldiers of Revolutionary fame brought to America as bedding for their horses. The loss resulting from the Hessian fly costs the United States as much each year as the entire expense of the Revolutionary War.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?
That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

The Weather and Our Food

UNIVERSITY OF ILLINOIS LIBRARY
MAR 26 1923

CHRONICLER OF THE NEGLECTED TRUTH

An Interview With Mellon

John Burroughs, Literary Critic

The Weather and the Production of Food

A Study of Weather Cycles and the Conservation of the World's Foodstuffs

Leviticus, XXVI-3, 4.—If ye walk in my statutes, and keep my commandments, and do them; then I will give you rain in due season.

By HERBERT J. BROWNE

This is the first of several articles by Mr. Browne, taking up the dependence of crop conditions upon the weather and discussing the possibilities of a drought. Mr. Browne also offers a suggestion designed to do away with the possibility of famine.

OF ALL the great problems which confront humanity and demand solution through governmental action, none is more important than that of insuring an ample supply of food, and yet there is none which has been so left to haphazard fortune. The farmers of the world cast dice with the weather and with plant enemies on one hand, and with dangerous economic conditions on the other. The strange paradox is presented continually of the food producer prostrated by his own prosperity; the more bountiful his crop the more inevitably its price falls toward or below the cost of production, while partial failure alone brings in a larger return in total price.

While the food producer is thus made the victim of weather and markets, the consumer—which is the whole human race—is no less a sufferer from prices made artificially high by the very gambles here set forth and the inevitable efforts to insure against adverse fluctuations.

This series of articles will show how definitely the production of food depends on weather conditions; will explain the basic principles of meteorology, and the signals which forecast sufficient rainfall or protracted drought. The history will be given of certain drought periods and abnormal years, and of the great famines which have been recorded. In turn, the economic plight which has befallen the American farmers will be shown. With the evidence thus presented, the conclusion will follow that the governments of the world should, each for its own people, warehouse at least a year's supply of wheat, the one most important food grain, first that their people may have a constant, certain and even supply of bread at a uniform price; and, second, that the producers of that food supply may have a definite, fixed and paying market, in which a good crop will be insurance against the hazards of a poor one, and not as at present the reverse.

How Radio Could Help

THERE is a close analogy between the solar heating and cooling system of the earth and the combustion and cooling cycles of an automobile. Each continental area is like a different make of automobile, but all work on the same principles. The great importance to the welfare of the whole human race of long range forecasting will prove one of the principal instruments in bringing about and maintaining universal peace. Five wireless stations on the arctic front of Canada could give Washington radio warning five days in advance of cold waves, and thus enable American fruit growers to protect millions of dollars' worth of fruit. Those stations would cost less to maintain than a single torpedo boat destroyer. The most important elements of the weather of Western and Central Europe can be forecast by stations in Greenland under the Danish flag. The weather signals of the Siberian stations will in time predict, four to six days earlier, the dates of storms now forecast in Manitoba, and meteorology indicates that the great Himalayan ranges and plateau have an important part in determining American weather, and consequently American crops.

Weather forecasting should know neither czar nor soviet; it should be as universal as the Lord's Prayer and as intelligible as the truth which sets men free. The weather under discussion is that of the northern hemisphere, and particularly relates to the United States.

The main problems of climate and weather can be reduced to simple statements. The sun's heat in the tropical zones is greater than its radiation there; so, through moisture-laden air currents and warm ocean currents, that surplus heat is carried toward the polar regions for discharge. Whenever and wherever moisture-laden air cools sufficiently its humidity comes down in rain or snow, apart from the much smaller quantity in dew or frost. Vegetation is the principal form in which the sun's heat is stored and retained. There are two principal ways in which rain is caused. Warm moist winds blow against a mountain range, which forces them to rise, expanding and cooling to the precipitation point. The windward sides of mountains near the ocean have heavy rainfalls, while the leeward sides have little. The other principal cause, especially in the temperate zones, is the meeting of a cold body of air from the north with a warm moist body from the south. The cold body acts like a mountain range; it thrusts itself under the lighter warm body, forcing it to rise, expand and cool till it precipitates its moisture. The cool current, with its stronger foothold on the earth, generally surrounds a body of the warm air and carries it along on its own course, which explains why storms travel at times thousands of miles.

When air warms it expands, and it contracts as it cools. Barometric pressures are the measurements of that expansion or contraction seeking relief. A barometric "high" is an area in which the pressure of expanding air has not been adjusted, and a "low" one in which the contracting tendency has not been completed. Since expansion is due to relatively warming influences, the tropical regions are the main source of "highs" and the arctic regions, for the opposite reason, the principal home of the "lows." But since ice and water cannot get below 32 degrees and air can and does drop in the arctic to as low as 70 degrees below zero, the ice and water may be relatively warmer than the air and thus create a "high." Similarly "lows" can be created in tropical zones by contact of heated air with colder waters or sudden descent of cold bodies from the upper air. The deep levels of all oceans are very cold and the lessening of pressure over an extended ocean area acts like a suction pump on a huge scale, drawing cold water from the depths.

A body of air 1,000 miles wide raised from minus 20 degrees to 80 degrees, a difference of 100 degrees, would expand 220 miles. That is about the normal expansion of tropical air on its way to the polar region, and is met by an equivalent contraction in its cooling. All winds are expressions of these two physical actions.

Relatively warm air in motion tends to flow outward, hence it follows a well-established physical law and turns with the hands of a clock, and is known as an *anticyclone*. A low area in motion is cooling and contracting, hence it tends to flow inward, and has a rotation opposite to the hands of a clock, and is called a *cyclone*.

There is a nearly *permanent high area* around the Azores, running south from the latitude of New York, known as the *Atlantic Subbermanent High*, and a similar one as well in the Pacific between San Francisco and the Hawaiian Islands called the *Pacific Subpermanent High*. There is a *Permanent Low* in the Atlantic near Iceland, and one in the Pacific near Bering Sea and the Aleutian Islands.

These are great air currents, sometimes hundreds of miles in diameter and having the characteristics of their names. They are not the causes of weather, but their varying sizes, changes in location, pressures and temperatures are most important in foretelling what weather changes may be expected.

Still another *High*, in Siberia in the neighborhood of Lake Baikal, covering the watershed from which spring the four great rivers, the Lena, Ob, Yenisei and Amur, gives the signals for weather conditions in the basin of the Volga and on the American continent.

It is the child of the Himalayas which is also the cause of the Indian monsoon rains. So the Himalayas may rightly be called the Father of the Weather.

The arctic ice cap, some 6,000,000 miles in area, has its major location between the North Pole, Siberia and the American continent, due to the landlock on the Continental side and the open Atlantic on the other, which lets in the northern arm of the Gulf Stream and lets out the huge ice fields in the countercurrents at all seasons. The location of this field is one of the main reasons for the greater severity of North American and Siberian winters than those of the same latitudes in Europe.

The tropical zones are the earth's heating and irrigation plant and the polar circles its refrigeration plants. Ice is stored cold. It takes as much heat to melt a pound of ice as to raise the resultant water to 180 degrees.

Rains Badly Distributed

FROM the equator to the tropic of cancer and farther north in summer lie the thermal waters of the Atlantic and Pacific extending well into the body of the continent in the Caribbean Sea and Gulf of Mexico. From their heated surfaces the sun draws from one-quarter to half an inch of water daily, or from 28 to 56 tons of water to the acre. Thus 137 inches of water is raised yearly from some 25,000,000 square miles of ocean surface. The actual figures are probably higher than these.

There are, again in round figures, 100,000,000 square miles of surface in the northern hemisphere on which this moisture must fall in rain or snow. Dew, frost and other forms of precipitation may for this calculation be ignored. There is, then, one-fourth of this 137 inches to be distributed more or less unevenly to each and every portion of this half of the globe, in rain or snow, an allotment of 34.25 inches.

It is obvious that this is very unevenly distributed both as to time and place. Much rain falls on the oceans near its points of absorption. Tropical regions tend either to rainy seasons with a high annual precipitation, like the Valley of the Amazon, with from 80 to 120 inches, a low average like the Peninsula of Yucatan in Mexico with about 14 inches, or none at all as in the Desert of Sahara. In the United States the figures run from 10 inches in Southern California to 10-20 in the high western plains, increasing to 20-30 east of the 100th meridian into the Missouri Valley, rising toward 35 through the Ohio Valley and to the Atlantic coast, and again increasing toward 60 on the Gulf coast.

The tropical heat finds in the ocean currents powerful instruments for distribution. The Gulf Stream, crossing the Caribbean Sea and curving around the west end of Cuba, passes the Florida Straits at high speed and enters the temperate zone with a mean temperature of 86 degrees, losing only two degrees with every 10 degrees of north latitude. Turning east off the Newfoundland Banks it reaches the British Isles still nine degrees above the bordering seas. Here the main body turns south to complete its circuit, but an important branch has set off northeastward, rounds North Cape, gives Russia a winter port in Kola Bay, and plunges under arctic ice between Spitzbergen and the Siberian coast, to start the easterly and northerly drift of Amundsen and other arctic explorers. The Japanese Current has a similar important route around the North Pacific basin, save that the narrow Bering Straits permit no such extensive arctic excursion as is taken by the Gulf Stream's offshoot.

The polar south-bound ocean currents are made up of waters from the northern branch of the Gulf Stream now cooled to near freezing temperature, the slighter current which in summer passes north through the shallow Bering Straits, and the balance from arctic snow, which, compacted into snow-ice in the great polar fields or flowing from the glaciers in icebergs, joins the southern stream either through the Greenland-Laborator Straits, or through the wide gateway east of Greenland.

For the purposes of this article, American weather can be considered as beginning with the movement of huge bodies of warm moisture-laden air pushed up from the Gulf of Mexico and the adjacent Atlantic by the expanding pressure of the subtropical high areas. By the time this front reaches the northern border of the United States a series of "lows" should begin to appear not far from the Canadian line. These "lows" run in families of from three to six, usually spaced about five days apart, and proceeding *en echelon* like the shares of a gangplow, each succeeding one swinging farther south than its predecessor. They all have an easterly tendency.

Now the *Aleutian Low* begins to assume importance. If it is above normal pressure and therefore weak and slow in its rotation, and at the same time north of its usual location, the *cyclonic low* will take a course far south, producing stormy weather with great alternations of temperature in the United States.

Effect of a Northern Snow

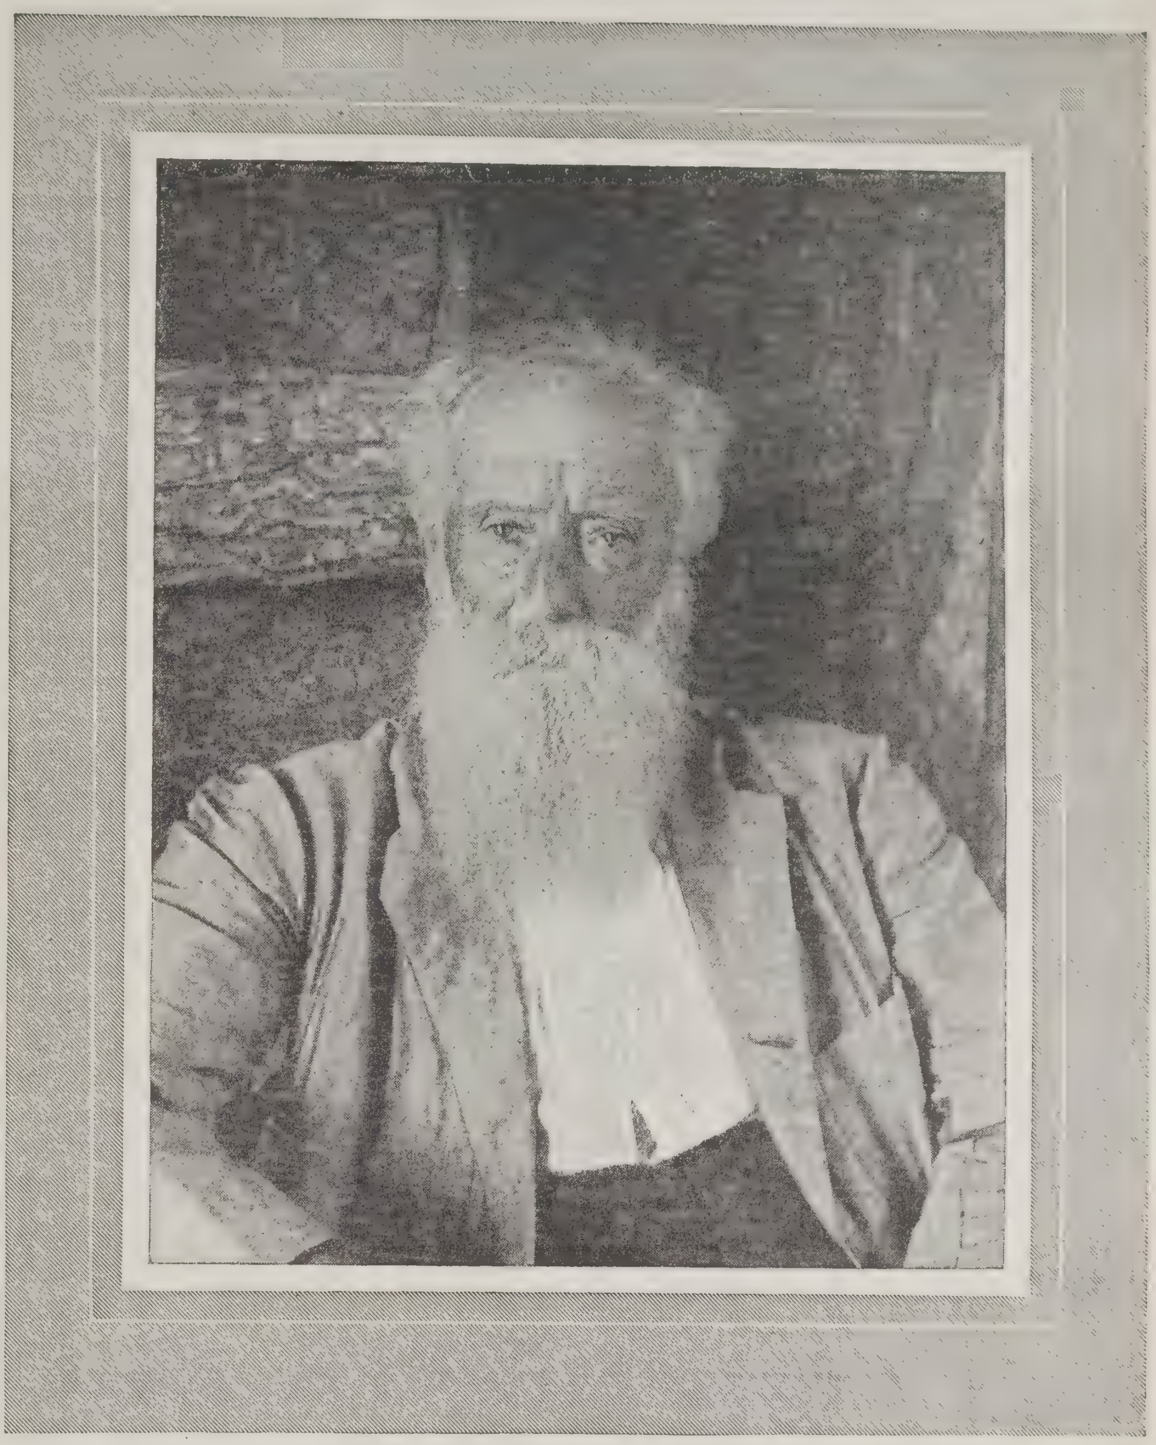
A DROP in the Aleutian barometer is the signal that a *cyclonic low* will appear somewhere on the American frontier within 36 hours. As it deepens, other "lows" of the group will appear, the second and third stronger than the first, and usually gaining in force toward the middle of their journey, as the encountered "highs" lessen their opposition. But the point of appearance of the "lows" *moves north and south with the Aleutian Low.* Here, then, is plainly a body of air still contracting in volume and obviously descending from the upper atmosphere, as proved by its anti-clock rotation. Its speed will be measured by its low barometer in contrast to that of the surrounding higher areas, and its ability to do its proper work will be measured by its area and temperature. If it is of high vitality and strength, that is, of low barometer and temperature and wide area, it will push a broad tongue under and around the warm moist air from the south, force it up so that both by expansion and commingling the warm air will cool and precipitate rain or snow, according to the season.

The rain front may be anywhere from 50 to 300 miles in extent, and its easterly progress will depend on the balancing of forces between the warm southerly wind and its arctic mate. If the *Aleutian Low* is well to the south and deep, the later members of the cyclone family may swing south to the Gulf of Mexico and then curve up the Atlantic coast in heavy storms, as did the fearful gale at the end of December, 1922, which raged clear across the Atlantic.

The indrawing currents of a *cyclonic low* pull in on their westerly side cold currents from the north, so the passage of a "low" is attended by a fall in temperature and occasionally further precipitation, especially on the high western plains. Between two cyclone families is usually an interval of time wide enough to let in an anticyclone from the arctic, when conditions are right. This will generally carry a temperature low enough to bring on a cold wave in winter and by thrusting under warm air in the spring produce frosts and even freezes destructive to fruit and early vegetation. A deep Canadian snow cover remaining late, together with a late and severe arctic winter, will cause such anticyclones to move far south like the cold wave of March, 1922, which swept the whole citrous belt from California to Florida, doing immense damage, or the two which in May, 1921-22, swept the fruit sections from New York to Virginia with equally damaging results

John Burroughs as a Critic of Literature

His "Literary Values" Work of Keen Analysis—By JOHN D. ANDERSON



JOHN BURROUGHS was born at Roxbury,in the Catskills, April 3, 1837 and died en route for home from California, March 29, 1921. His family was poor, and he was obliged to earn his living at an early age by teaching school. A volume of Audubon which came into his hands when he was about 25 proved the inspiration for the study of birds and nature which has been his passion through life. He was a clerk in the Treasury Department in Washington during the latter part of the Civil War, when he wrote his first book, "Wake-Robin," and part of his second, "Winter Sunshine," living over again in them his youthful experiences. From 1873 until his death, however, he has lived on the banks of the Hudson in the midst of the woods and fields which he most enjoyed. Much of what he learned he imparted to his readers in his long series of delightful books, which include accounts of his travels in England, Alaska and Jamaica, and essays on literature, science and philosophy, as well as his unrivaled interpretations of nature. He often declared that he could take root nowhere else than in the Catskills and that he found his greatest delights in being privileged to live there nearly all of his 84 years.

I SUPPOSE that most people who know John Burroughs by reason of what he has written love him. Nearly all of this group will be very likely always to regard him as a man of the woods and of the solitary places—the man so entranced by nature and nature's ways that he seemed always to be an actual part of his isolated surroundings. That was one John Burroughs, but there is another.

Let us see if he is not more than the man who tells us of his rambles in the fields and delights us with his accounts of bird life. Others have taken us on journeys such as he makes though none have told us in such happy phrases what it all meant to them. If we cannot take from our own observations of nature all that John Burroughs was able to take, it is because we cannot throw about it the witchery of thought such as he was capable of employing.

He has told us that literature does not grow wild in the woods. "Every artist does something more than copy nature; more comes out in his account than goes into the original experience." Either consciously or otherwise John Burroughs has, in much that he has written, given us a new literature and it is more than merely writing about forests and flowers and trees. In it all he has been self-revealing and his mind is an open book to those who may choose to read what he has set down.

By no means all that he has told us has to do with wild life along the river banks, in the open spaces or in the wilder spots of the Catskills, or indeed in places farther distant from the region he loved best. He has done more than this and has in two of his books—his interpretation of Walt Whitman and "Literary Values" shown keenness beyond that displayed by most literary critics in showing us what are the enduring qualities in literature and what is the chaff. He never brands harshly the work of any writer but a study of John Burroughs, the literary critic of high merit, enables us the better to select that which is really worth while.

How many people have made the discovery that John Burroughs is a first-rate guide to literature and reading—that the contents of four of his 22 published volumes are taken up, not with nature-writing, but with the art of literary expression. If he had not been critical in his estimations he could not have written as he did about Whitman 29 years ago. This work he completed a couple of years after the time of Whitman's death which took place at Camden, New Jersey, March 26, 1892.

It requires a deep study of the art of writing as found in the production of others to make a competent judge of literature and it takes a kindness of heart and frankness of manner to make the worth-while critic. All of these qualities were both well blended and well balanced in John Burroughs.

Writing all that he did about Whitman was perhaps more a labor of love than anything which he ever put on paper. Burroughs' first meeting with the "Good Gray Poet" was through the latter's writing. He speaks of it in this way: "I first became acquainted with Whitman's poetry through the columns of the old *Saturday Press* when I was 20 or 21 years old (1858 or 1859). The first things I remember to have read were "There Was a Child Went Forth," "This Compost," "As I Ebb'd With the Ocean of Life," "Old Ireland," and maybe a few others. I was attracted by the new poet's work from the first. It seemed to me a larger, freer air than I found in the current poetry. Meeting Bayard Taylor about this time, I spoke to him about Whitman.

"'Yes,' he said, 'there is something in him, but he is a man of colossal egotism.'"

John Burroughs says that a few years later, when he was presented with a copy of "Leaves of Grass" it proved both fascinating and a puzzle. "I gazed upon it like a colt upon a mountain, taking what tasted good to me, and avoiding what displeased me, but having little or no conception of the purport of the work as a whole."

Perhaps if John Burroughs had given us these two books earlier and before his reputation as a naturalist and a nature writer had become so firmly fixed in the minds and thoughts of his readers it would have been a bit easier for him to have attained more fully the reputation of a critic. It took a good while for Walt Whitman and his work to grow into John Burroughs' mind, just as it has taken time for Whitman's work to grow upon other minds, until today those who in their praise place him in the front rank of American poets without raising objections from persons who earlier would have given to Poe and to Longfellow and to Bryant a higher place than any of this trio now occupies. Whitman has advanced with the passing of the years. The reputations of many have become dim with flight of time.

From 1863 until 1873 John Burroughs and Walt Whitman were intimate and the friendship lasted until Whitman's death. Burroughs recounts that he went to Camden yearly to see his friend.

"It is the true breath of humanity and not literary merit that constitutes the beautiful," declares Renan. And John Burroughs declares that Whitman was not linked with the studied and scholarly productions and not open to the more bookish mind, but was more akin to the primitive utterances and oracles of historic humanity. "A literary age like ours lays great stress upon the savor of books, art, culture, and has little taste for the savor of real things, the real man which we got in Whitman. * * * He has aimed at the larger poetry of forces, masses, persons, enthusiasms, rather than at the poetry of the specially rare and fine. He kindles in me the delight I have in space, freedom, power, the elements, the cosmic, democracy, and the great personal qualities of self-reliance, courage, candor, charity."

Toward the close of this book John Burroughs admits the difficulties which surround and hedge in the one who attempts to write about Whitman. He says that he felt almost as much at sea with regard to him as when he first began to study him; not, of course, at sea with regard to Whitman's commanding genius and power, but with regard to any adequate statement and summary of him in current critical terms.

Burroughs declares that as a man Whitman united the masculine and feminine elements in a remarkable degree, as he united the innocent vanity of the child with the self-reliance of a god. In his moral aspects he united egotism and altruism, pride and charity, individualism and democracy, fierce patriotism and the cosmopolitan spirit, while in his literary aspects he united mysticism and realism, the poet and the prophet, both the local and the universal.

Burroughs expresses the belief that Whitman will not live by separate passages or in a few brief poems any more than Shakespeare, or Homer, or Dante, or the Bible so live. "The chief thing about Whitman is the personality which the poetic gift is engaged in exploiting: the excitement of our literary or artistic sense is always less than the excitement of our sense of life and of real things. The appearance of such a man as Whitman involves deep world-forces of race and time. He is rooted to the very basic structure of his age."

Had John Burroughs never encountered Walt Whitman, it is not unlikely that Emerson would have remained his great inspiration. He was much swayed by the New England philosopher in his very earliest writing, apart from his nature essays. He admits that we owe much to Emerson but Emerson was much more of a *made* man than Whitman. The secondary forces had a hand in his life to greater degree. These were the college, the church and much of New England social and literary culture. What Whitman wrote has in it the incentive of nature and the charm of real things and what he has done has been to foster manly endeavor and to encourage the great virtues of sanity and self-reliance.

The person who for the first time takes "Literary Values" in hand for a reading will never forget the opening sentences of the book:

"The day inevitably comes to every writer when he must take his place amid the silent throngs of the past, when no new work from his pen can call attention to him afresh, when the partiality of his friends no longer counts, when his friends and admirers are themselves gathered to the same silent throng, and the spirit of the day in which he wrote has given place to the spirit of another and a different day. How, oh, how will it fare with him then? How is it going to fare with Lowell and Longfellow and Whittier and

Courts Not Above Criticism

SOME time ago, discussing the life tenure of Federal Judges, THE DEARBORN INDEPENDENT remarked the increase in the feeling that appointments to the national judiciary, being almost entirely for political service rather than demonstrated ability, necessarily made court decisions liable to bias instead of careful analysis of the constitutionality of the laws under challenge.

The fact is not of recent origin, for in the history of the Federal bench it is a matter of easy demonstration that even among the best of the jurists on the Supreme as well as the lower courts, few names have been selected exclusively for merit. From Justice Marshall, whose constitutional interpretations are accorded more weight than those of any other head of the Federal Supreme Court, to Justice Taft, whose decisions have been most criticised, it would be difficult to select a name not chosen from among the active partisans of theories held by the appointing power.

In recent years labor decisions have met with the most severe and outspoken denunciations, and the opposition has declared such criticism to be almost, if not quite, treasonable. Instead of recognizing the right of free personal opinion and its expression, the suggestion is frequent that such questioning of the sanctity of courts should involve severe penalties.

Among labor decisions, those affecting the employment of women and children have been met with especially strong vituperation. It is doubtful if the average citizen realizes the extent to which remedial laws intended to correct industrial abuses have been voided by the highest court, while few know the effect of such decisions on classes not especially sympathetic with the labor movement. One such publicist writes:

"Bulletin 321 of the Federal Bureau of Labor Statistics deals with the efforts of various legislatures to enact laws for the protection of labor that have failed because of court action declaring the statutes so enacted unconstitutional. No less than 270 instances of such ineffective legislation are cited. It is not surprising, in the face of facts like these, that both the laboring people and the friends of progressive legislation are growing increasingly sensitive in reference to the type of men appointed as judges. For even the fairest of men are swayed by their preconceptions and their usual modes of thought."

But for its moderation, the quotation might have been from one of the most radical of labor publications. It is, however, from the St. Louis *Christian Advocate,* a leading Methodist weekly, and is a fair example of the expressions of church papers of almost every denomination, although unusually mild in tone.

The growth of the sentiment that in some way the greed of industry, which demands the sacrifice of human life and character, may be curbed. is a welcome sign. The right of each child to a chance in life, the demand that industry cease enslaving the toiling masses, not only as a right but as a safeguard to society, will in the end prevail.

Lumber and Labor

IT IS a common thing for publications devoted to the construction business to charge to the high cost of labor any deterring influence on building. Excessive figures in tenders are invariably accounted for by reference to the cost of labor. It is therefore of great interest to the public that an authoritative analysis of cost should be made, and the *Retail Lumberman* is entitled to thanks for having made it possible to figure out the exact bearing an increase in wages has to the total increase in the cost of building.

The *Retail Lumberman* publishes sample advertisements calculated to be sales promoters. These are usually illustrated by pictures and charts that serve the double purpose of calling attention to and explaining the text.

A late example is headed, "Don't Let This 'Bird' Frighten You," and pictures a modern frame house, flanked by the "bird," which is labeled, "High Price Bugaboo," in pursuit of a roll of paper to which the artist has given legs, arms and a countenance in which fear is depicted. This fellow is labeled, "Your Plan to Build."

Accompanying is a chart, showing the relative cost of the items going into the full contract price of the house. This chart places the cost of the lumber at 17 per cent of the whole. Then follows the argument:

"There are a few prospective home builders who get all 'worked up' over an advance of $1 or $2 in lumber prices. Perhaps it is because they do not realize how small a part of the total cost of a home is represented by the amount spent for lumber. The diagram above shows how the costs are divided. Don't let the High Price Bugaboo rout your plans to build."

A summary of the chart shows that an advance of $1 a thousand feet of lumber could affect the total cost less than one-fourth of one per cent.

The value of this easily understood explanation is that the chart applies not only to the item of lumber, but to every other item enumerated. Lumber stands second in the list, being exceeded only by "excavating, stone, brick and concrete work," at 20.1 per cent, which, of course, is subject to a similar comparison.

The third item is "carpenter and miscellaneous labor," which accounts for 15.6 per cent, also entitled to the same comparison.

The injustice of charging to labor the excessive cost of building is thus made apparent, as wage variations could not much exceed, if they equal, the added cost due to advances in lumber prices. The three items enumerated comprise 52.7 per cent of total cost.

There is no line in which labor cannot be shown less blamable for high prices than the public generally is led to believe. The railroads, for instance, figure the cost of extra men on train crews where trains exceed a certain number of cars, but they do not let the public know that the addition of a single loaded car to a train more than covers the labor cost of the entire train for the distance carried, while the addition of a man to the crew adds but 20 per cent to the wage cost of a train exceeding fifty cars. The wages of a crew handling 75 to 100 cars is identical with that of a "light" engine sent 100 or more miles after an accumulation of loads or empties.

The Department of Labor has estimated that the average labor cost in production is but nine per cent. If this be true, how little effect changes in hour or day wage can have on ultimate price.

The Highest Tax

WITHIN a short time the retail price of granulated cane sugar has risen from a level of about six cents a pound to nine cents and eleven cents, or 50 per cent. Except for the brazen announcement that "because of a threatened shortage, prices will be" and so on, no explanation is offered, and the commissions and fact-finding committees which are paid to keep us posted will probably not have a word to say.

Sugar is one of the most staple of foodstuffs. With an unlimited field of production, there is no danger of any shortage from natural causes. The charge has been made with truth that even in the midst of the World War, there was not a moment when the Sugar Trust could not have supplied the world needs at normal prices and made a handsome profit.

The hypocrisy of the Sugar Trust is exposed by the Oakland (California) *Observer,* which quotes the announcement of the monopolists as stating that certain branches, including those on the Pacific, would not raise prices at present, but had no sugar for sale. It is declared that the warehouses in California are filled to capacity.

A tax levy approaching a fraction of the new sugar rate would cause a revolt powerful enough to retire an administration. Many families will pay a bigger tax on their sugar than the collector will ask on their homes.

The President Puts Them Back

THERE is no objection whatever to any former United States Senator making his living. It would be rather serious if we had reached the time when a term in the United States Senate disqualifies a man for the respect and confidence of his fellow citizens.

And yet, when the people with marked emphasis express their desire that certain men be disconnected with the government, it may become a delicate question how far a President may go in reinstating such men to places in the government.

It is always to be assumed that when the people throw men out of the government, they want them out.

The President has taken care of a number of former officials whom the people discredited at the last election. He may have felt that "the party owed it to them." Probably the "party" does. But is it for the "party" to pay its debts with the funds and emoluments of the people?

No one begrudges the defeated Senators their new jobs. But what does their reinstatement in government positions do? It simply makes the city of Washington that much more stuffy as an official center.

Our government is rapidly becoming a concentration of men and methods which the people have repudiated, and that is not a good condition to encourage.

Risks All on a Single Throw

SENATOR HIRAM W. JOHNSON has gained his position in politics because of his bitter opposition to the regular organization of the party to which he has always claimed allegiance. He has delivered some powerful blows at reaction, and has received severe thrusts. He has demonstrated his hold on public favor in California when the party press has opposed him with a more than ordinary spirit of hatred. Instead of revolting in 1920, as Roosevelt did in 1912, he accepted the situation and took counsel with himself as to the course most wise for him to pursue.

Theodore Roosevelt brought reaction to his feet. The party sought his leadership after he had demonstrated his power. His death left his followers without a leader sincere and courageous enough to maintain the progressive ideas for which he fought. Johnson, proclaimed a worthy disciple, accepted the turndown by the machine with hardly a protest, yet kept the strength he had in his own state long enough to win a new term in the United States Senate. It was expected that Senator Johnson would strive to retain leadership among those who have been consistently hostile to "the interests."

For a year, however, Senator Johnson's course has been such as to cause conjecture as to his purpose. Pursuing a policy of isolation from his progressive colleagues, first deserting, then opposing them, the theory is advanced that he is seeking the favor of the reactionary wing of his party. It is claimed he has made overtures to the machine, and hereafter must be classed with the standpat reactionaries.

The case of Hiram Johnson thus becomes one of those tragedies whose true history seldom reaches the public. There are some, of course, who insist that he was insincere from the beginning. Supposing that he was at least ambitious (which always involves a certain proportion of public insincerity) was there not as fine a prospect for success in the progressive field as in the field he now occupies? More than sincerity is implicated in the change which has come over Senator Johnson's position. There was a day when Senator Johnson rose in the Senate and threatened, in words that set the Senate breathless, to make exposures that would rend the party: he has never made them. No one hearing him speak could doubt that he had knowledge, and neither could they doubt that he was capable of making his knowledge public. From that day to this his progress has been a steady recession into reaction. Why? What was the pressure, public or private, that made it seem ill-advised to Senator Johnson to continue on his progressive course? That it is pressure, public or private, the whole situation seems to indicate. Certainly it is not conviction nor a change of conviction, nor can it be ambition, for Senator Johnson may certainly know now that the faint prospects he formerly had are faded forever.

Mr. Ford's Page

THE conduct of a business is dependent on its beginning, because what is wrongly founded cannot be properly carried on. And yet there is perhaps less care taken about the planting of a business than about any other part of its history. The reason for this oversight in the past has been sheer ignorance, but now enough business experience has been had to enable all intending business men to understand what the principle of planting ought to be.

To begin with, no business can be justified at all which is not designed to perform some constructive service to society. That seems simple to say and yet few things are harder than to gain complete assent to its truth. It is harder still to induce practice to follow upon assent.

But even to say that is not to say it all. Most of the standard businesses exist because, however faultily, they do perform some service to society. We are rapidly passing out of the stage of experience where absolutely harmful businesses can exist. One after another the major parasites in business are being abolished. Society will no longer support that which for profit destroys society. We may count one by one the collapse and disappearance of those trades, beginning with the trade in human beings, which have flourished by the degeneration of their customers.

> *THE first rule of business is: Begin Right. Your best capital will be an article that serves and a market needing the service. Your worst capital will be money put into your hands for the sake of the dividends you are expected to produce. A business that is primarily obligated to dividends will not be able to rise to the only element that produces profit—the Element of Service. Stockholders who have no part in the work of a business are a millstone about the neck of the business, and few businesses ever survive them. Begin with your idea and your article and let them build up your business. Let it grow from its own roots. It will be sounder and stronger for it. But best of all, it will escape the dry-rot of the absentee stockholder which has so harmfully affected American business in the past.*

It remains, however, that many businesses which are entirely necessary and useful to society are conducted on the same principles which marked those businesses which were unnecessary and entirely hurtful. Even a good business which renders service may be so conducted as to curtail service and greatly minimize the usefulness that ought to mark it. Examples of this will readily occur. Take the grain trade. Surely nothing could be more justifiable than the trade which places breadstuffs within the reach of men everywhere. And yet it is a public scandal long continued that this business has been conducted less with reference to breadstuffs than to money profits. The bread service has been minimized and at times seriously dislocated that the money profits might increase. Coal is another example. The supply of fuel to a population annually subject to the rigors of winter is a business which would seem to have every element of high humanity in it, and yet what citizen does not know that the whole emphasis of the coal business has been to render fuel hard to get.

So that there is quite another problem, which is the proper conduct of a proper business.

No business can justify itself and be conducted mainly for profit. Surely it should not be necessary to fence that statement with explanations, and yet no statement is more certain to be misinterpreted. The first mistake made concerning it is that it is "idealistic," that it expresses an altruistic temper and not a practical experience. It seems to be a flouting of profit as unnecessary.

So that it becomes desirable to add that, of course, no business can be conducted without profit. Profit is the daily food of commerce upon which the serviceable enterprise sustains itself. What is meant is this: a business whose first purpose is profits is a business whose profits are precarious, because its emphasis is against the very element which inevitably produces profits, namely, the element of service. People patronize a business because it serves them in some need; even though it niggardly supplies the need and at a cost in excess of that which the principle of service requires, still they patronize it; but never to the extent that they patronize a business where service comes first. And a niggardly service is always at the mercy of a more generous service: here is the main field of competition, that of service and quality.

But why is it that so many businesses must start out to consider profit first and service secondary? There is, of course, the element of human greed, but it may be said that a man actuated by greed never really invents the idea around which a great business can grow: the greedy mind is too small for such great seeds to grow in it.

There is something else to consider besides greed, there is the fallacy of business organization. Many a business begins wrong and never gets right again, because in beginning wrong it has enslaved itself to the wrong principle.

To be very plain about this: a business which is rooted in stockholders begins with a millstone about its neck and can never come to its normal stature until that millstone is removed.

The objection to stockholders is not a selfish one. That is to say, one does not object to the number of persons who profit by a business. The more people who profit the bigger and better the business is. Profits ought always to be threefold and plentiful—they should flow to the public that patronizes the business, to the men that work in the business, and to the business itself that it may grow stronger and more serviceable.

The objection to stockholders is this: from the very first, a business rooted in stockholders must bend all its energies to the production of profit as the first and major object. It cannot do otherwise. Stock companies exist to produce dividends first. Stockholders are often described as people who put money into a business; they are better described as people who want to take money out of a business without doing any of the work necessary to produce the money. Analyze the mind and motive of the person who invests in stock, and what is it?—it is the desire to take a percentage from the earnings of other men. The stockholder is mostly an absentee, he does not as a rule lend himself to the building of the business. He is always a liability. He enters for the sake of profits and his demand is always for profit. If anyone would fully understand the curtailment of service in business, let him examine the influence of the absentee stockholder. No one should profit from a business who does not serve that business in the capacity of producer or consumer. The customer is as much a part of the business as the seller is, and both are entitled to a profit.

Men ask, "Well, how are you going to start business without stockholders? Isn't capital necessary?" Capital is necessary. An idea is capital. Means to produce a few of the things that are to be sold, is capital. The market—the need of the people for what you have—is capital. But a lot of people hanging around the side lines waiting to take what the business produces is not capital, it is liability. Every man at work is an asset; every man with his hand out is a liability.

It remains for young men to learn this lesson: start with what you have; let the worth of what you have build up the business; let it grow steadily out of the service it renders; and if it is really rendering service it will grow steadily and soundly enough. Besides, in this way you will learn and you will be able to make improvements as you go along, whereas if you start big, your whole apparatus and organization are molded upon a commodity which may need to be improved but which you cannot improve because you have patterned everything to produce it in just the style in which it may have been conceived. A business which wishes to start out full-grown is stunted all its life.

The whole character of what you attempt will be colored by the way you begin. If you begin after the parasitic fashion of the day you will be feeding parasites as long as the business lives, and eventually the parasites will kill it. Begin with what you have; let the business grow by worth and work; and where these elements exist the necessary profit will not be lacking.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Latest Swindle: "Psyching the Jack" Charlatans' New Game Prospers

"Doctors of Scientific Healing" on "Lecture Tours" Reap Rich Harvests From Credulous People Whom Fakers "Wish Well"

By A. FRANCIS MORTON, JR.

THE "Spanish swindle" has gone the way of the fake oil stock game. The three-shell man no longer has a concession with the traveling circus and carnival company; the rain-maker, the patent medicine show, the lightning rod fake and the clairvoyant are now things of memory. A new fake has taken the center of the stage patronized by the gullible masses. A new army of fakers infests the land.

A few weeks ago the writer received a telegram from an old acquaintance asking him to join him. A few days later we sat in his elegant apartments in one of the finest hotels in the West. He wore a two-carat diamond; he had a wardrobe of a dozen or more suits of clothes; he carried an office staff with him, and every stenographer seemed busy answering letters. He had his stenographers and private secretary quartered in the same hotel, and to reach him it was necessary to make an appointment a day or two in advance.

"I knew you when you did not have an extra suit of clothes and now—!"

The "Free-will Offering"

"JUST as frank as ever, aren't you? Three years ago I had but one suit of clothes and I was flat broke!"

"You must have struck it rich?"

"I have," he answered, "I have the best game in the world. Psychology has made me independently rich. I'll make $10,000 out of this town and this is a nasty place. The doctors ride you fearfully. But I made $13,000 in the last town!"

"How long do you remain in a city?"

"I stay in a town about a month. I give a dozen free lectures and then I hold a class in applied psychology and scientific healing. I get $25 for a membership and almost every class member buys a set of my books. That means $15 or $20 more. Then I give private readings—psychoanalysis. I make a few appointments for private healing also."

"But how can you afford to give a dozen free lectures? Your hall rents must be high." He smiled as he glanced at the two-carat diamond on his left hand.

"I take up a free-will offering each night. The hall costs me $100 and the collections always pay the hall rent and a part of the advertising bills as well." I had noticed several six and eight-sheet lithos on the signboards near the union station; I also saw several display advertisements in the morning papers as I came in.

That evening I attended his "free" lecture. I noticed that the collection plates were stacked up in the front office of the theater ready for use. *A dollar bill was on each plate!* A little later I heard my old friend give his opening talk on "The Law of Abundance." This talk was calculated to unloosen the purse strings of his audience.

"As you give of your abundance," he said, "so it shall be returned to you twofold and more. During my campaign in S——— last winter an old lady came to every one of my free lectures. Each night she put a dollar bill in the collection plate and as she gave her dollar, she later told me, she visualized it coming back to her in $10 bills. She was perfectly relaxed, in mind and body, and her sweet soul was sending out vibrations of love and charity for all the world as she gave her dollar. Before I concluded my class, which she also took, she told me of the great demonstration she had had.

"Vibration Did It"

"SHE got up in the class and told us all about it—of how she had been giving a dollar each night as she sent out her vibration for greater happiness, health and prosperity. She said she had just about run out of dollars when one day the postman brought her a letter from a distant relative who had inherited an immense fortune. This relative had more than he wanted, more than he could use, and so he sent this dear old lady a check for $10,000. How did it come about? Vibration did it, my friends, and this is a scientifically proved fact. That old lady had been sending out vibrations of love and charity as she gave of her abundance; night after night she relayed the thought of health, happiness and prosperity and her vibrations went way across the continent and lodged in the consciousness of that rich relative who had more money than he knew what to do with. So it is, my friends, as we send out our thoughts for health, happiness and prosperity these things come back to us. As we give so we receive only we receive more, 10 times more, in return, than we give. We are now going to take up the evening offering. Relax your minds and bodies and as you give of your abundance be sure and send out the thought that it is coming back to you; visualize the money pouring into your lap, feel it, count it and plan how you are going to spend it. Don't visualize for $10 when you might as well visualize a million dollars. The law of abundance knows no limit. Don't think in terms of pennies but in terms of dollars." And then the ushers passed the collection plates—*and each plate had a decoy dollar.*

All through the "free" lecture the speaker told of his experiences in some city several thousands of miles away. He told of cancer cures he had wrought; he told of 41-pound tumors he had eliminated through autosuggestion; he told of marvelous and miraculous cures of epilepsy and paralysis, and there seemed to be no limit to the number of cures he had wrought in every field of human misery—from broken necks to corns. "In the class which follows I teach my class members how they can do the same thing," was thrown in as a seasoner, and appetizer, during his talk about drugless healing and the power of the subconscious mind. When he talked about the phenomenal success some of his former class members had achieved—in cities several thousands of miles distant—he never failed to tell his audience that "in the class which follows I teach you how to attain business success, prosperity—and love. There is no reason why any woman should die an old maid. There is no *scientific* reason why *anyone* should be homely and ugly."

Books Help His Profit

HE HAD been holding forth in one of the largest auditoriums for a week and so I missed the first half of his "free" lecture course, but for the remainder of the week I spent with him he constantly "sold" himself to the audience. A corps of salesmen sold books before the main attraction each evening. These sales people were given a commission of 50 per cent on all sales. Before the "psychologist" left the city two of his sales force attached whatever office equipment the deputy sheriff could seize for unpaid commissions!

Later in the week I enjoyed several conferences with my old acquaintance and he told me of his success. When I knew him he was a struggling minister in a little town out West. He was "Reverend" to everyone in those days. Now he is "Doctor." He has written (?) about a dozen books on psychology but in reading them closely one is impressed with the fact that a great many paragraphs sound as though they had been written by someone other than the alleged author. There are pages of reading matter inclosed in quotation marks but no credit is given, either in the main body of the book or in the footnotes which invariably acquaint the reader with the fact that a more extended treatment of the subject matter may be found in another book, by the author, which sells at $3.50. The "free" lectures impress one with the fact that their main object is to get the loose change of those who cannot afford to spend $25 for the class "which follows" and to whet the appetites of those who purchase one book to the extent that they will buy another.

Hecklers Gotten Rid of

THE learned "Doctor" could not converse with any one familiar with any authorities on psychology and psychoanalysis. If any one in the audience attempted to take issue with him he invariably told the heckler to "hire a hall—I paid $150 for this one!" He refused to meet any one at all antagonistic to his theories, and it was as hard to get an audience with him as it is with the chief executive of the United States. But during my stay with him I learned more about the psychology of "getting the money" than I ever will be able to acquire in so short a time again. He had everything figured down to a nicety, and when he could not get money he got food. On one occasion he had a whole basket of fruit brought to the theater and delivered to him on the stage. He read a fictitious name as he fingered a card and said: "This dear old friend knows I love fruit. This occurs in *every* city I visit—some kind friend brings me a basket of fruit, food or other good things." During the remainder of his stay in the city he had plenty of fruit, brought by gullible people who had swallowed his talk about the "law of abundance." And at the close of the "free" lectures a "love offering" was taken up for the good "Doctor."

And just a few days ago I met a young lady in a city in Indiana. This young lady is reputed to be one of the most successful "campaigners" in the business. She has adopted some of the methods employed by "Billy" Sunday and she is ofttimes referred to as the "Billy Sunday" of psychology. She has a glib tongue, a charming personality and considerable business ability. She has been credited with having taken in no less than $17,000 in one single week. Like the "Doctor" this little lady is a good promiser. From the signboards, the public prints and a most elegantly printed line of handbills, heralds and programs she proclaims herself the wonder woman of the age. She promises to make clear the way of success in business, health and marriage. Like the "Doctor" she promises to tell you "How to make your dreams come true" and "How to achieve prosperity." She speaks of "science" and "psychology" as though they were recent discoveries, and the gullible public is invited to come out and hear her lectures "free." She sells books, gives private readings, accepts "love offerings" and in all her so-called "free" lectures she constantly refers to "the class which follows."

Reaping Golden Harvest

DURING my visit with the "Doctor" he told me how he happened to take up psychology. He had attended one of the "free" lectures and courses offered by the little lady I met a few days ago. He had been an adept student and in some minor details he had improved upon her methods of "psychologizing" her audiences. Especially had he improved upon the matter of making one evening pay a handsomer return than others. The "Doctor" advertised through the papers and from the platform each night that he would, on a certain night, give his "great sex lecture." This lecture was featured, and the "Doctor" did his utmost to impress upon his hearers that "this is no ordinary talk on sexology." In speaking of the big feature night the "Doctor" suggested more than he really put into words. The "sex lecture" was advertised liberally; his staff passed the word along to the ushers, and the ushers whispered some of the unadvertised "features" and by the time the lecture was to be given most of the seats were occupied by gullibles willing to part with $5 to listen to a talk composed of age-known facts concerning personal hygiene and sexology.

These campaigners are reaping a golden harvest from the gullible public. They have taken advantage of the fact that the present generation is given to an earnest effort in self-knowledge. They have done an endless amount of harm, and the methods employed to sell psychology as a patent cure-all of everything from marital unhappiness to cancer and poverty at once places these fakers in the same category with the three-shell man, the "Spanish swindle" and a host of other get-rich-quick schemes polite society outlawed long ago.

Psychology and psychoanalysis, properly applied and employed, will do wonders. A knowledge of the functionings of the subconscious mind will lighten the burden of thousands now harassed with self-pity, timidity, superstition and countless kindred woes of the mind. But it is not necessary for anyone to pay $25 to any of these so-called psychologists to learn the elementary laws of the subjective mind. Any ordinary library affords a source of information covering the entire field. However, it is not likely that the crowd which listens so intently to the glib-tongued "campaigners" would ever be inclined to go to the public library to get first-hand information from an authority on a noble science that is being prostituted by these promisers of wealth, health and success in love and marriage.

It Used to Be "Green Goods"

THESE charlatans are responsible for countless misconceptions of both psychology and psychoanalysis, and while many of them are reaping small fortunes through their "campaigns" it is safe to assume that their day of reckoning is not far distant.

The real psychoanalyst does not go about the land to proclaim himself a "wonder man" nor does he offer to sell the recipe of health, success, prosperity, love, marriage and beauty for $25. He does not conduct himself like a one-ringed circus, nor does he "psychologize" his audience to the extent that they will shower him with gold, fruit and other gifts in a vain hope that the so-called "Law of Abundance" will return a handsome dividend of 100 per cent.

Years ago the "green goods man" used to sell the union station, Brooklyn Bridge and the Statue of Liberty at least once a day; the patent medicine show held forth in the small hamlets and hundreds of people carted home gallons of medicine for every imaginable human ailment; the "Spanish swindle" was driving some farmers back to the farm, and hundreds of gawkish boys fell for the three-shell game in the side show. But those days are no more, and yet, "day by day in every way" the sheep are being shorn as the lambs were fleeced—years and years ago!

The New Jersey Colony of the Easter People

Village of Hope, in New Jersey, Today Evidences Its Founders' Handwork

IF WE are properly to understand the subject of the founding of the Moravian colony at Hope, in Warren County, New Jersey, in 1769, we must first glance backward to the earlier history of the Easter People. We must recount a bit of their Old-World life.

The Moravian Brethren formed a Christian commission first founded in the east of Bohemia. They were followers of John Huss (1373-1415). For some time after he was put to death, the Hussites split into two factions and wars followed. Under Peter of Chelcic, a leader who anticipated not a few of the teachings of Tolstoy, one branch of the church in 1457 founded a new community in the then deserted village of Kunwald. This sect taught the Apostles' Creed, rejected Purgatory and the worship of saints, practiced infant baptism and confirmation. They differed somewhat from Martin Luther in their doctrine of justification by faith. Their belief was that true faith consists in "knowing God, loving Him, doing His commandments, and submitting to His will." Their earlier history is interlaced with that of Moravia throughout the period coincident with the discovery of America.

At the head of this church was a body of 10 elders. These were elected by the synod which consisted of all of the ministers and this was constituted the supreme legislative authority of the Moravian Brethren. By the year 1549 the movement spread into Great Poland and educational institutions sprang up to further the teachings of the church. In the year 1609—the same that Hudson discovered the river which bears his name—Rudolph II granted the Letter of Majesty. At that period the Brethren formed half the Protestants in Bohemia and considerably more than half of those in Moravia. And this was the time of their greatest influence as a church denomination in Europe.

The Thirty Years' War nearly crushed them. They were widely scattered or absorbed by other churches. Some fled to England, others to Saxony and there is a legend to the effect that a party of them reached the shores of Texas. As a church group, however, they became nearly extinct and would no doubt have ceased to exist but for the efforts of Bishop John Amos Comenius (1592-1672). The branch which came to display the most activity was located in Germany—descended from the Waldenses who had left Moravia as early as 1480.

Count Zinzendorf became their leader and permitted a group of the Brethren to settle upon his estate in Berthelsdorf and there they built the town of Herrnhut. This was in 1722. He saw the abiding advantages which would come to those of the Moravian faith if a sufficient number of them could be induced to come to America. Their immigration was finally accomplished and the settlement was made at Bethlehem in Pennsylvania. A little later the village of Nazareth was also founded.

Zinzendorf had made more than ample plans for those who sought homes inland and beyond the western shores of the Atlantic. He had purchased from Lord Granville 100,000 acres of land. This vast tract was situated in that region of which Salem in North Carolina is now the center. There has been preserved there for us very full accounts of the founding of that Moravian colony. The Count had instructed Bishop Spangenberg to select the colony site in the land lately purchased. This was no easy task for the time was as long ago as 1752. Some three months were required by the bishop and his companions to explore that wilderness and select a suitable spot for the founding of the Salem Colony. They named it Wachau, Wachovia.

It was not until some months later and after the region had been surveyed that the first of this group of colonists left Bethlehem. This was the eighth day of October, 1753. Those to take the journey were 12 unmarried Brethren. These were to be the conquerors of that vast land nearly a thousand miles to the southward. They were not only to found a colony but to be the founders of a new religion in a new land. In the group were farmers, a pastor, carpenters, a baker and a doctor. It was not until November 17 that they reached the little cabin—their shelter in that lonely land. Thus reads the story of the beginnings of the southern undertaking.

While English settlers were pushing northward and westward into New Jersey, into what are now the Sussex and Warren County regions of the state, the Moravians at Bethlehem were only prospecting. In those days a very large part of the population was from necessity engaged in farming. It was indeed the only thing for most of them to do if they were to live.

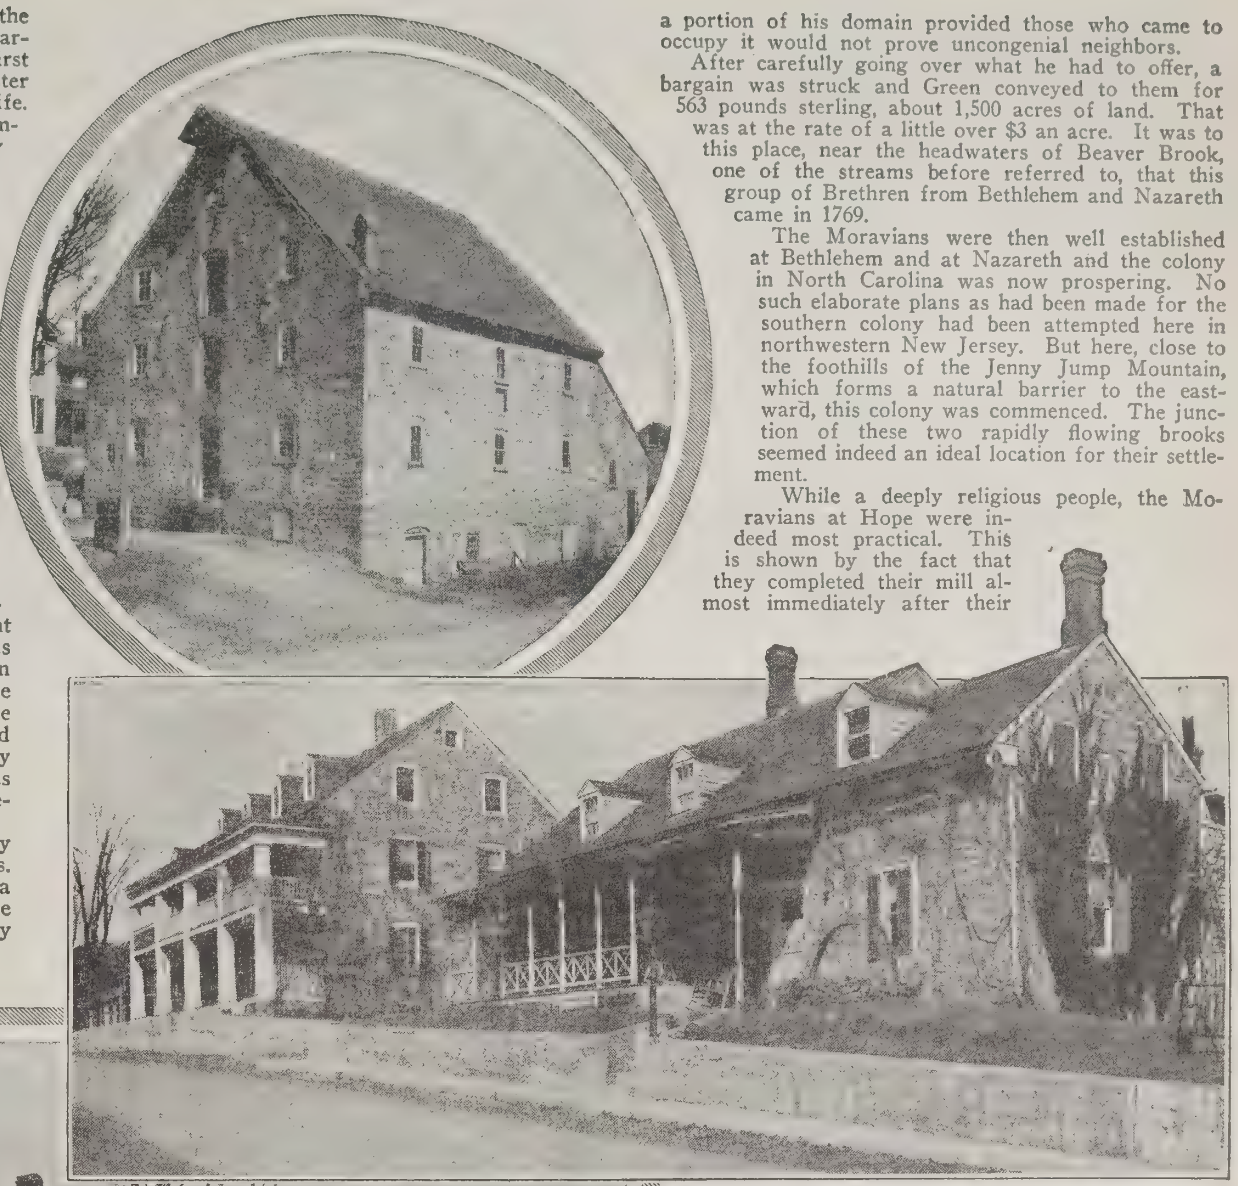
There had been a settlement in the region of Oxford, only about a dozen miles from Hope, as early as 1730. Hackettstown, 10 miles to the east, was founded some years before the Revolution. The pioneer settler in that region to which the Moravians came a little later was Samuel Green. He had gone there with his family from Long Island shortly before the French and Indian War, but the exact location of his abode is not now known. Sampson Howell was the second white settler. His advent was in 1767 or 1768. He was a man of remarkable versatility. He had not been long in the region before he had a well-cleared farm and sawmill, and is believed to have killed more bears, wolves, deer, wild turkeys and other game than any man who ever resided in that region. He left a larger number of descendants than any other pioneer of Warren County.

Those early arrivals were ever and ever in quest of fertile lands and it was to this region eight miles to the eastward of the Delaware River that the Moravians sent an exploring party in 1768. They had heard that at this junction of two small rivers—one formed by the final outlet of twin lakes three miles distant and the other by a lake much closer at hand—was much fertile soil, also that Mr. Green would not be averse to selling a portion of his domain provided those who came to occupy it would not prove uncongenial neighbors.

After carefully going over what he had to offer, a bargain was struck and Green conveyed to them for 563 pounds sterling, about 1,500 acres of land. That was at the rate of a little over $3 an acre. It was to this place, near the headwaters of Beaver Brook, one of the streams before referred to, that this group of Brethren from Bethlehem and Nazareth came in 1769.

The Moravians were then well established at Bethlehem and at Nazareth and the colony in North Carolina was now prospering. No such elaborate plans as had been made for the southern colony had been attempted here in northwestern New Jersey. But here, close to the foothills of the Jenny Jump Mountain, which forms a natural barrier to the eastward, this colony was commenced. The junction of these two rapidly flowing brooks seemed indeed an ideal location for their settlement.

While a deeply religious people, the Moravians at Hope were indeed most practical. This is shown by the fact that they completed their mill almost immediately after their arrival and their church was not finished until 1781.

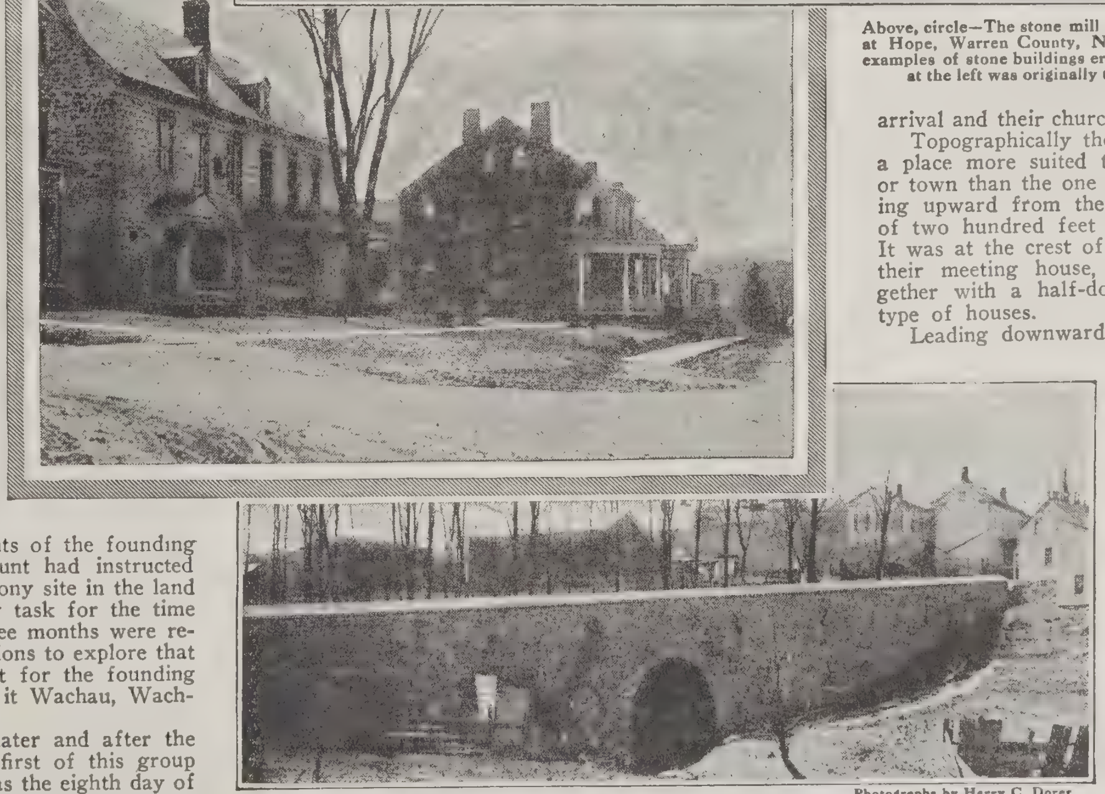


Above, circle—The stone mill erected by the Moravian Brethren at Hope, Warren County, New Jersey, in 1770. Below—Best examples of stone buildings erected at Hope. The large building at the left was originally the school, erected about 1772.

Topographically there could be found nowhere a place more suited to the building of a village or town than the one these people chose. Extending upward from the brook's course to a height of two hundred feet above it, is a sloping bank. It was at the crest of this that the Brethren built their meeting house, parsonage and school, together with a half-dozen or more of the better type of houses.

Leading downward to what had been planned as the lower part of the town, after the Continental fashion, they constructed a bridge—built causeway fashion. This stands even today as a memorial to the mason workers of those times.

The church stands near the center of the upper village and is the most imposing and substantial building erected there by these thrifty people. It has seen many vicissitudes since its builders and their descendants left this region. It is of gray limestone, of massive thickness and shows none of those customary forms of decay which we think of and describe as the ravages of time. Here it stands—the mute witness of the days of war and strife when the nation was struggling for independence; onward through the Constitutional period—the nation-forming period.



Photographs by Harry C. Dorer

Above—The large structure at the left was the church of the Moravian Brethren, completed in 1781 and abandoned in 1808. The building at the right was the parsonage at Hope. Below—A stone bridge constructed by Moravian Brethren at Hope. The bridge connects the upper and lower sections of the village. It was built about 1770.

Today this village at Hope, that portion in which the Moravians had a hand in building, shows on every hand the skill, the enduring love which characterized its founders. Its mill, originally a community undertaking, is today one of the best examples to be found of the plain architecture of that time. This, too, is of limestone with walls fully two feet thick. On three occasions since it was constructed the interior woodwork has been destroyed by fire. After each conflagration the walls were found to be firm and in no way damaged. Here grain is still ground.

Its water wheel is fed through a channel which extends 200 yards or so to the pond beyond. The water course or channel connecting the pond with the mill

(Concluded on page 14)

The Unprofitable Steam Train Is Replaced

Gasoline Car on Railroads Popular and Aids in Solving Pressing Problem

"Number 9000," the first rail bus put into service by the New York, New Haven and Hartford R. R., which now operates some 150 miles a day.

By J. OLIN HOWE

WHEN on a railway journey, how often you have wished you could ride on the engine and see the road ahead. Perhaps you have even done this, in which case you found a surprising succession of jolts and tremors and on a single track line through the countryside nothing to indicate whether or not the rails ended at the coming curve. In any event, the wish to ride on the engine and watch it eat up the miles before is common to railroad travelers of any age. Even the most hardened commuter never quite gets over it.

Which is one reason for the popularity of the gasoline rail car which is solving some of the pressing problems of American railroading. Railroads are replacing the time-honored branch line steam train with the gas bus which runs over the same rails. It is not so well suited to main lines, where the density of traffic calls for far more extensive equipment and permits of its profitable operation, but on the branch line—whose stations are comparatively few and whose passengers sometimes fewer—the gas car fills a real need.

The passenger has taken to such cars. Not only are their windows so large that the entire sides seem of glass, but these same big windows continue around the front of the car and the driver is no particular obstacle to a full view forward. Riding through the country on one of them is a very pleasant experience. Their speed may not be that of the steam train—and yet, there isn't so much difference; 20 miles an hour is good speed for a branch line train. And these gas busses can stop at every pair of bars, if need be, whereas it costs a tidy sum to stop and start even a two-car steam train.

However much progressive railroad men may see the present need to sell their service to the public, though, their interest in the gas rail car springs rather from the economic urge. The gratifying savings it makes possible and the appearance of pleasing figures on the right side of the ledger make it popular. It averages to cost from $1 to $2.50 a train mile to run a two-car branch line train, which has space for 120 passengers but not the passengers. Gasoline rail cars seating 35 passengers have been operated for as little as 14 cents a train mile—an average figure, not for some single mile—and 35 or 40 cents seems a fairly dependable figure. It runs higher than this on some lines, but well below what it cost to operate branch line trains.

Costs Much Less Per Mile

THE newer rail vehicle reduces the necessary passenger constant, to speak in mathematical terms. Of course, it isn't possible to figure the precise profit or loss of a railroad train for any single mile or even a single run—since too many other elements enter into the problem besides the mere exchanging of passenger car space for fares—but railway auditors like to think they can do this. It is easy to find the passenger constant, however.

One simply divides the cost per train mile by the 3.6 cents the government permits the roads to charge. If the two-car steam train costs $1 a mile to operate it must carry a constant average of 28 passengers; if $2.50 a mile, this must not drop below 70 passengers. At 14 cents a train mile the gas car clears its operating cost with four passengers constantly on board.

It is plain to be seen, then, why scores of applications for discontinuance of service on branch lines pending before the Interstate Commerce Commission have been pigeonholed by request and many have been withdrawn. Sometimes this has been followed by an application for the reopening of lines where the commission has already permitted service to be suspended.

These lesser lines where population is thin, which are often of vital importance as feeders and where service needs be maintained to preserve franchises, are the livest kind of problems to railroad men. Sometimes they are highly prosperous in summer but a total loss in winter. Even the most pessimistic is, however, free to admit that the gas car materially reduces the loss from this source and, though it may be hard to get official confirmation of this, the fact is that many a road is making money on them.

The total of this loss is not a small one. It comes to a good many millions every year on short passenger hauls in these United States, which has at least 60,000 miles of branch and short line railways. Fully one-half of this mileage is in such condition that it may not escape the scrap heap, even with the aid of the gas rail bus. It is surely doomed if steam operation continues. No small amount has already been scrapped.

Numbers of these lines were originally built with local capital for the development of their sections of the country and had largely served their purpose before being acquired by the larger system, to which their chief value is naturally as feeders—of freight even more than passengers, perhaps. Many millions are invested in them, but on a strict auditing basis most have long since ceased of themselves to pay any return on the investment.

A high official of one of the great western trunk lines admits that at the end of its latest fiscal year his system found itself behind the game on these short line hauls all of $7,000,000, incredible as that may seem.

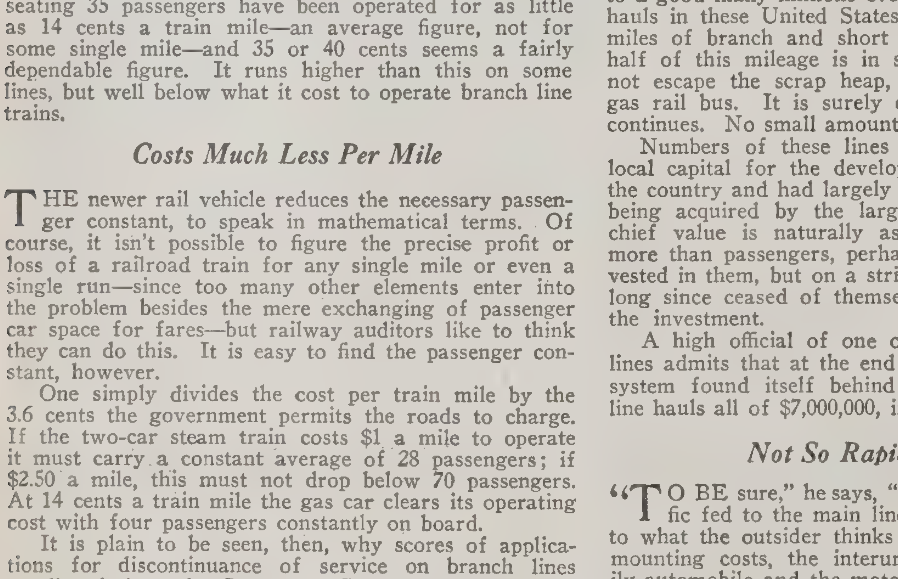
Not So Rapidly as Surely

"TO BE sure," he says, "there is a set-off in the traffic fed to the main line, but that may not amount to what the outsider thinks it does. Anyway, between mounting costs, the interurban trolley line, the family automobile and the motor truck, it will not be easy to find a branch line which is making a profit on steam operation."

It will be interesting to learn what can be said of these two systems even 10 years from now. For each has got out into the light of that new day which is dawning for the small lines and is using the gas rail car.

It comes not so rapidly as surely, this change. No sudden transformation is to be expected, however clearly the advantages of it might be realized by rail executives. But the little gas car is well through the experimental stage and a list of the railroads, large and small, which are already using it would read like a rail Who's Who. They range from New England to the Pacific Coast, from the Mexican border to the Canadian and even across both borders.

To some extent the Pittsburgh and Shawmut Railroad is a pioneer in its application to the short line. This road passes through the coal mining section of Western Pennsylvania and touches no sizeable cities. Really a freight railroad, it reached a state where it was taking a continuous loss on all passenger service. Yet the decrease in freight revenues consequent upon discontinuing passenger trains would be well-nigh fatal, for unless there were trains to convey miners, production of coal would fall off seriously.



Northern Pacific officials and the 17-seat car they found suited to the Gilmore and Pittsburgh, a subsidiary which covers a hundred miles in the mining country of Montana and Idaho.

The gas rail car seemed made to order for such a situation and in 1921 the Pittsburgh and Shawmut placed three in operation. They immediately reduced the cost of passenger service from 71 cents a train mile to 35 cents. They have seating capacity for 45 passengers, but have been known to carry twice that number. They are not designed for high speeds. On level track they easily average 30 miles an hour, but the coal road has numerous heavy grades and its schedule calls for an average of but 22 miles an hour, including stops.

One car operates out of Brookville, Pennsylvania, and the other out of Kittanning. The first has a round trip of 98 miles which it negotiates daily with great success. The Kittanning car's daily run is 83 miles. Neither has ever been derailed nor suffered any difficulty more serious than delay by reason of snow and ice. The third car is kept in reserve.

On the Brookville car the wages of the crew of two, including overtime, come to $7.83 a day for the driver, a qualified engineer of the line, and $9.38 for the conductor; and on the other the figures are $7.83 and $9.38. This is 17½ and 22½ cents a train mile, respectively, for wages, half or more of the total operating cost a mile. These cars average 6.8 miles a gallon of gasoline, a very presentable figure in view of their size and the grades.

The cleanliness of this service is an important point, but above all is the fact that these rail motor cars have put the passenger department of the Pittsburgh and Shawmut on a paying basis. They give more frequent service; they have developed business not otherwise obtainable; and the road's passenger business is now an asset rather than a liability.

The Gilmore and Pittsburgh is another railroad in a mining section, afar in the northwest, which has found the gas bus well suited to its purpose. The G. and P. is a subsidiary of the Northern Pacific, about 100 miles long, connecting Armstead, Montana, with Gilmore and Salem, Idaho. It is largely patronized by miners and has suffered in its passenger business through automobile competition.

Deficit Turned to Profit

THE gas cars of the Gilmore and Pittsburgh are smaller, having seats for but 17, but have baggage accommodations, as have all of these motor cars for use on rails. The line has very severe grades; the steepest between Leadmore and Gilmore is six per cent; but on the initial trip over the line the little car with self-contained motive power had no difficulty with them and actually took three per cent grades between Armstead and Salmon on high. Soon afterward it made a great record in heavy snow, plowing through drifts that would have taxed a steam engine.

Of quite another character is the Narragansett Pier Railroad, which has made the transfer to the right side of the ledger with the gas bus. It is only eight miles long, between the Kingston, Rhode Island, station of the New York, New Haven and Hartford Railroad and the popular New England summer resort, with stops at Peacedale and Wakefield. Not only is it paralleled by automobile trunk highways but until recently also by an electric line which has finally fallen upon evil days and been suspended. The 1920 deficit of the Narragansett Pier road from steam operation was $16,000.

It was a case of change methods or suspend—at least, during the winter—and in the summer of 1921 the line put on its first gas car, a standard 35-passenger affair with baggage space 9 feet by 6. It is operated by a driver and conductor, but on occasion has actually made its run with but one man in uniform.

Here we have a point of interest. A two-car steam train can hardly operate with less than four men in its crew and unless trainman and baggageman are one the total will be five. It takes two men to run the engine alone. Probably the powers that be would

The branch line steam locomotive which is being pushed into the background by the gasoline engine and a car far better suited to present conditions than those it has been accustomed to draw.

hardly countenance running the gas car with but a one-man crew, but it can be done.

At all events, the Narragansett Pier's gas car has brought an increased volume of passenger business which makes a fascinating graph. Its summer business formerly reached its peak with around 19,000 passengers in the month of August or September, whereas in the summer of 1921 a single month showed 26,000 fares turned in and the December following found the line carrying some 3,000 more than in any previous December.

The old Sidell and Olney Railroad was one of these short line affairs which went the way of so many. It is only 32 miles long and runs between the towns of Kansas and Yale in Illinois. Its business gradually fell off and its costs mounted perhaps not so gradually and finally, some three years ago, it was sold to the junkman. When the farmers along its route finally awakened to the true state of things its rails were about to be torn up.

They got together to prevent this, put up the necessary funds to buy their railroad from the junk dealer and organized the Westfield Motor Railway Company to succeed the Sidell and Olney. Then they bought a gasoline rail car and put it on. This not only took care of all the passenger business, but mail and express as well, and from the beginning has been a money maker.

The gas bus saved their railroad for these people. The single car they have has covered more than 100,000 miles. It has required very little care and few replacements, and has never been under a roof. The company owns none.

More than the branch line of larger systems the independent short line has been the real proving ground of these railway motor vehicles; and there are far more of these small railroads scattered throughout the United States than one would think possible in these days of combinations. Some 500 of them belong to a national association which has its headquarters in Washington and is co-operative in character, even maintaining a used equipment department which is a sort of clearing house for member lines.

Rail Chauffeurs Employed

MOST of the roads in this organization have tried self-propelled rail cars and a majority now use the gasoline car to a greater or less extent—not a few exclusively. In many a case among them the gas bus has changed ledger figures from red to black. The association has records of cars which have been in practically continuous service for five years or more and some have run as much as 300,000 miles.

Their operating cost varies from 10 to 25 cents a mile and gasoline consumption runs from 5 to 10 miles a gallon. The lower cost a mile and the higher mileage to the gallon refer to cars of a small type which are operated by but one man. But some of the 35-passenger type with two-men crews are running at a cost as low as 20 cents a mile.

They figure this 20 cents a mile as follows: labor (two men at $125 a month), 8½ cents; gasoline, 3 cents; depreciation (12½ per cent), 4 2/10 cents; interest and insurance, 2 1/5, and maintenance, 2 1/10. These figures are based on a purchase price of $12,500 and operation of 106 miles each day.

It is also of interest that on the short line roads more than half these cars are being operated by younger men, trained mechanics, and thus able to care for minor repairs, but not locomotive engineers. The executives of these lines take the attitude that they need not have the skill or training of the steam engine driver, and they do not draw standard wages. Such rail car chauffeurs have not yet been classified by the Interstate Commerce Commission.

Among the more important railroad systems the experience of the New York, New Haven and Hartford is being watched with no slight interest—by others than railroad men, even—since the New Haven is the first of these thoroughly to try out the gas rail car. In but a few months its use of them has passed well beyond the laboratory stage and the little car has supplanted steam service on regularly scheduled runs which are to appear indefinitely on the time tables. The Southern New England system has three in daily use and plans for more.

One is kept at Litchfield, Connecticut, and each morning drops down out of the Northwestern Connecticut hills to Danbury and thence east to Waterbury, returning over the same route in the afternoon. It makes a daily mileage of 138 miles. It is worth noting that the line between Danbury and Waterbury is a section of the old New York and New England, the former trunk line between the Hudson River and Boston over which through expresses first ran between Boston and Washington. The through trains are now deflected south at Waterbury and this piece has reached the status of the despised side line, only an incubus with steam operation.

The second car is also used in Connecticut, covering the 11 miles between New Haven and Derby several times a day and once daily, making a round trip between New Haven and Northampton, Massachusetts, 45 miles distant, totaling 146 miles a day. Fifty years ago the New Haven-Derby line was in the first rank, but the times have passed it by. Competition from a paralleling trolley line and two main highways had made the New Haven ready to suspend service upon it when the gas bus hove in sight.

The New Haven-Northampton run is over the old "Canal" road, on whose route the transition from canal boat to gas car has taken place within the memory of some still living, and which was formerly a busy transportation artery but had become a dead weight.

Nine Miles to a Gallon

THE third car makes the round trip of 30 miles between Fairhaven, opposite New Bedford, Massachusetts, and Tremont twice a day.

These New Haven cars are but half the length of the standard railroad coach, carry 36 passengers and their crew of two and have space for from 1,000 to 2,000 pounds of baggage in the customary location at the rear end. They have reached a speed of 43 miles an hour for consecutive miles, are guaranteed to make 35 and average 28, including stops.

They readily make nine miles on a gallon of gasoline and 200 miles on a quart of lubricating oil. They take the place of steam trains costing to run from 75 cents to $1.50 a train mile and with revenues of but 20 cents to $1 a train mile. Their revenues are actually larger and they have cut costs so appreciably that last year the books all but balanced and this year are expected to do better than that.

This railroad car which carries its own power plant is not exactly a new thing. Railroads have been experimenting with it for more than a generation. Back in 1891 the Pullman Company built such a car, with a single-cylinder gas engine in the center which was supposed to run continuously, regardless of the speed of the car. The power was transmitted to the driving gear through storage batteries instead of directly from the gasoline engine. This carries the gas-electric idea pretty well back.

They named this car "Eureka" and really thought at the time they had found something. They hadn't found much, though, because of the unreliability of the gas engine of that period. The car was intended for street railway purposes, in reality, but was tried out instead on a branch line of the Pennsylvania System running out of Columbus, Indiana. It was even operated on a sort of schedule, making runs of 20 or 30 miles two or three times a week and on one occasion getting up a speed of 45 miles an hour for a five-mile stretch; but in the end was given up as impracticable.

A dozen years later a couple of young engineers of the Louisville and Nashville were bitten by the rail motor car bug and developed a steam driven rail car for branch line use. They had their troubles, but felt they were on their way to a practical solution of the problem when orders from higher up caused abandonment of the project. The president of the line was a conservative soul who could see no good in "newfangled" contraptions. Long after his road had perfected axle lighting and its cars were bright with electric lights he was sticking to old-fashioned oil lamps on his private car.

About the same time the Chicago, Burlington and Quincy built a gas-electric car, using a stationary gas engine connected to a dynamo and with motors on the axles. But the gas engine had not progressed far enough then, either. It was heavy, poorly balanced and most uncertain in operation. The car did little useful work. Its engine explosions were so violent as to disturb villagers and alarm cattle in the fields and after a year or so this experiment went into the discard.

Around 1904 or 1905 the Burlington's engineers worked out a steam motor car for rail use whose engine and running gear were similar to those of a small locomotive. This also was pretty much a failure because of excessive weight and the fact that the boiler did not have sufficient steaming capacity to propel the car continuously at reasonable speed.

So that the story of the rail motor car is not unlike that of many other utilities. The experimental period produced many strange and crude affairs. Various types of cars rose and fell, usually because they stuck to the old heavy-duty locomotive idea. At best, they were built by car builders, who had to depend on railroad men for technical details. None solved the railroads' problem, but in general they did serve to demonstrate the limitations of the gasoline engine for use on rails.

Meantime the motor truck, undreamed of perhaps when the Pullman Company built its "Eureka," was born and in these later years has become mighty in the land. Only when the motor truck was transferred from the highway to rails, when it was finally realized that the two problems were so similar that the railroads might well take many a leaf from the book of the automotive engineer, was there evolved a really practical gas car which would enable the rail lines to come back. That was but yesterday.

A Lusty Infant, Indeed

EVEN now the gas rail car is little more than out of swaddling clothes, but it is a lusty infant. It has proved itself, and its adaptation to smaller lines anywhere is but a question of meeting local conditions. The day of the steam locomotive on branch and short lines is about over. The rail lines have picked up the gauntlet of the highway motor car. Ere long, except on through expresses, the passenger will bowl along through the country almost anywhere on these self-sufficient gas busses.

Their development will hardly be in the direction of trailers or being coupled in trains, despite the reluctance of some of the railroad executives to give up these notions. But longer and heavier cars of greater seating capacity—run singly, as now—are undoubtedly a matter of the near future. There are numerous short lines and important branch lines which need them if they are actually to depend on the gas car.

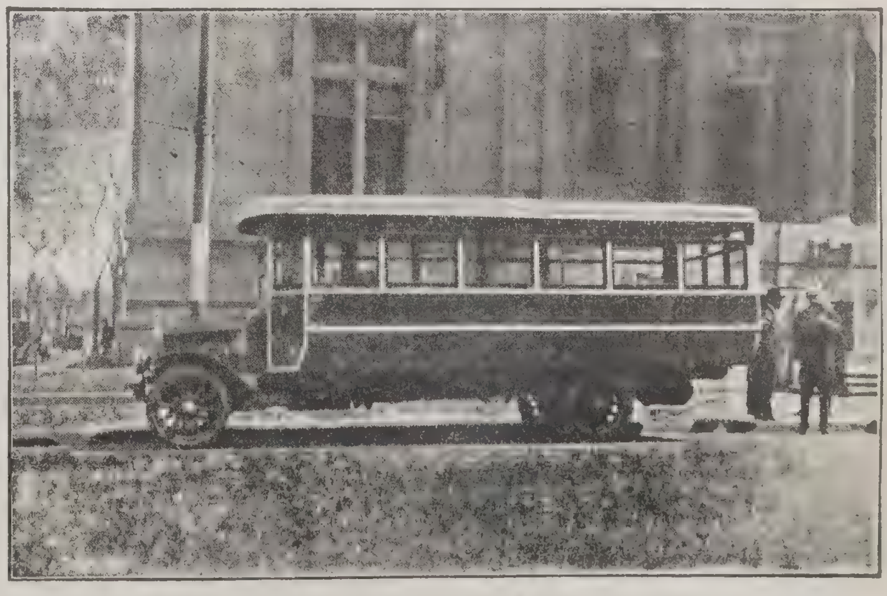
This means a much more powerful motor. In cars such as those used by the New Haven road the motor is of 60 horse power, and of the same design as that in the highway truck. Engineers are at work on a motor of twice this horse power for the rail car.

It will be three or four years before this can be ready for general use, in any case; and then the gas rail car may grow to a size approaching the 60 feet of the standard coach, seat 50 or 60 persons and make speeds of 40 to 45 miles an hour regularly. It may even get up to main line class.

This means starting with a clean sheet of paper, though, for there is no highway chassis at present which could be adapted to a car such as this. It doubtless means two four-wheeled trucks under the car, moreover, in place of the two-wheeled driving truck under the body of the car and four wheels under the engine in front which have been found best for the present types.

New heating methods must be developed, too, though this may not be troublesome. It has been found comparatively easy thus far to heat the 36-passenger car by the use of exhaust gases from the motor, but probably the larger car would have to depend on a hot-water heating system.

One thing that is altogether likely—and highly desirable from the operating standpoint—is that it will be arranged to drive from either end. It cost the Narragansett Pier road $1,200 for a turntable to enable it to use the gas bus.



The highway bus on a truck chassis which has been adapted to railroad use

Teaching Business World to "Play the Game"

Unfair Practices Must Not Be, Lesson of Federal Trade Commission

By HUSTON THOMPSON
MEMBER FEDERAL TRADE COMMISSION

Mr. Thompson desires it to be understood that this and a second article soon to be published express his own individual views and are not binding upon the Federal Trade Commission.

THE Federal Trade Commission has been in existence eight years, and has weathered the storm of attack that inevitably beats down upon a new public body that seeks to do its duty. It has emerged with the stamp of approval placed upon it by the highest court in the land in two very notable and recent cases.

No longer in the experimental stage, the commission has become the subject of study by delegations and representatives from a number of foreign countries, who have visited its offices to get first-hand knowledge of the law, the commission's procedure and the results attained. In a number of instances other nations, after such study, have created governmental bodies having a function identical with or similar to that of the Federal Trade Commission.

Our own business world is now repeatedly seeking its aid, as is evidenced by the hundreds of calls for assistance where an industry desires to eliminate practices, or a small business concern believes it is about to be "sunk without a trace" by one of its larger competitors or where a large business interest seeks protection against another one equally large.

Now that the commission has a permanent place in our governmental and business life, it is well for the people of the country to understand just what and why it is, and to ask what it needs that it may be of greater service to the public and to those courageous business interests both large and small who desire a natural and lawful growth and endeavor to keep a fair field for all in the business arena.

To understand it and its needs, we must first understand its purpose, and this requires some little analysis and illustration, for there has been a widespread misunderstanding, and, at times, I regret to say, misrepresentation of its purposes.

When I came upon the commission after a service of five years as assistant Attorney-General, I found myself in an entirely different atmosphere. In the Department of Justice things are more or less settled along well-defined lines, and no one thinks of refashioning the functions of that department. In the Federal Trade Commission, however, everything was new. The language of the law creating the commission had not been tried out in the courts. The commission was just starting to chart the sea of competition, and because of the opposition of those in the business world who did not understand its aims, I found we had to face some rather rough and choppy weather, which in those early days threatened at times to engulf us.

Took Exception at First

TO MY surprise I discovered that a considerable portion of the legal fraternity also took exception to certain functions of the commission, mainly because it was not fashioned along the lines of a court. Some lawyers not having examined into the purposes of Congress in shaping this governmental body, which was to have investigatory powers and was expected to act with more expedition than a court, and which was not permitted, as are courts, to levy fines, fix penalties or imprison, insisted that the commission should, nevertheless, be surrounded with many of the technical legal rules from which the courts themselves are trying to escape.

Starting with the idea that the commission should be semi-judicial, they declared that its practice of investigating an abuse brought to its attention, then issuing a complaint and finally trying the persons charged in that complaint and issuing an order against those who were guilty, was combining the functions of sheriff, prosecuting attorney, and judge, and wholly illogical. Their argument might have had force if it had been the intention of Congress to fashion the commission after a court, but it was just this very thing which Congress sought to avoid. Congress wanted a governmental body free to investigate with dispatch and stop practices injurious to those in the business world and through them to the public, leaving it to the party to have his day in a court if he chooses to take an appeal from the commission's order. This meant, of course, that the commission was to be an administrative body—not a court.

When it has reason to believe that the charges made by one competitor against another require the commission to go ahead in the public interest, the latter, to avoid a contest between two competitors, who, in their zeal, sometimes lose sight of the affect of their actions upon the public, figuratively speaking, steps forward in the place of the complaining party, not as his attorney, but as the guardian of the public welfare, and says to the one charged, "Here is the evidence against your practice. What have you to say in favor of it?" And if the defense is not sufficient to overcome the facts bearing against the practice, the commission then says, in substance: "Stop the practice!"

Always the respondent is given full opportunity to explain away the charges. Then the charges are either dismissed or orders are issued. The very fact that it has not been surrounded with all of the limitations that are put upon a court, has given the commission the flexibility and expedition necessary to meet the rapidly moving conditions of the business world.

What shall be said of another group, small in number but powerful in influence, who insist that the commission shall be given the power to rule in advance—that is, that a corporation may submit its plans to the commission for ruling on the legality, in advance of the plans being put to performance. In other words, they would have the commission be the guide or legal crutch upon which business may lean.

The first day that I entered the commission I had a practical illustration of the futility of such a procedure. For months one of my new colleagues had been besought by a great corporation to pass upon the fairness and legality of one of its contracts which involved a business practice to which many of its competitors were bitterly opposed. My colleague exerted every proper effort to accommodate himself to the desires of this particular business interest and at the same time to eliminate certain objectionable paragraphs of the proffered plan that were obviously illegal and dangerous to other business interests. But his efforts were in vain.

Then in desperation he passed it over to me. I likewise pointed out certain objectionable language, and my callers agreed to redraft the contract to meet my objections. Several weeks later they brought the document back with the undesirable paragraphs eliminated, but replaced by others containing the old illegalities dressed up in a different language.

In the meantime, the competitors of this company were sending forth distress signals, and the commission having found the facts as to how the plan was actually operating was compelled to issue a complaint.

Repeated experience has taught me that from the cold type of the most harmless looking document, which on its face appears strictly legal, or from the honest but incomplete or misinformed statement of the interested parties, one cannot tell how the plan will eventuate. The only test of programs which are apparently legal on their face is to be found in the results obtained from their operation. This is due to the fact that the interested party may voluntarily change his point of view, or be compelled to do so by unforeseen circumstances, which will produce illegal effects or acts. Only that person who can read the future and has the power of divination would be safe in passing upon such business plans and giving his approval in advance.

I often wonder if the advocates of this type of a commission have thought their idea through in a practical way and realized its drift. The shibboleth of many of them is "Less Government in business." But would there be less government in business if the commission were given the power to rule in advance, since to rule in advance would mean not only telling a group what they could do, but, if they were to be granted immunity, also what they must do.

To tell business not only what it can do but what it must do would of necessity restrict its initiative, cause commercial paralysis and make our government distinctly paternalistic.

How could the commission's present staff of 317 employes, or even a considerably augmented staff, cope with the problems that would be thrust upon it by the business interests of this country under such a plan? There are several thousand business or trade associations, approximately 320,000 corporations and hundreds of other commercial groups, and thousands of them have problems and plans about which they would like to be advised by some public official. I have yet to come in contact with a trade association that did not have its legal problems of competition about which it would like to receive guidance.

The number of employes necessary for this work would run into thousands. In addition to the lawyers, economists and administrative employes already on its rolls, there would be needed engineers and other business specialists of all kinds, and after a most exhaustive study of a problem it would still be unsafe to advise unless the official knew the intent behind the proposal was honest and could be assured that the one proposing it would not swerve from this intent.

What Congress Intended

CONGRESS intended through this body to declare more emphatically than ever its belief that competition is the life of trade. In being moved so to legislate, it was obeying an inherent and conscious instinct regarding which our courts have repeatedly sustained it and such as has expressed itself in the virile stages of all civilized nations which existed so long as they kept the channels of trade free from artificial obstructions and unfair practices but sealed their doom when they permitted monopolies and acts subversive of the general welfare to devitalize commerce and trade.

The commission was called into being not because the Sherman Act was not a wise and necessary law, but because the Sherman Act condemning monopolies and combinations in restraint of trade was not invoked until the combination was hatched. Experience has taught us how difficult it is to discover the hatching time or to unscramble that which has been already scrambled.

Hence, it was necessary to find some means by which the unfair practices leading up to monopoly or combinations in restraint of trade could be stopped at their beginnings. The Sherman Act took control of the business patient when a major operation was necessary, and something extreme had to be done. Congress, on the other hand, felt that if there could be a governmental diagnostician constantly surveying the business world, both as to its general conditions and in particular cases, the unnatural growth might be discovered early and the trouble eliminated without too great shock to business stability.

So it gave two powers to the Federal Trade Commission. One was the power to investigate corporations and business from time to time where the public welfare was involved, either upon its own initiative or that of the President, Congress, or the Attorney-General, and to make reports to them and the public when it believed it was in the public interest. This made the commission a fact-finding body and enabled the commission to see the business world much as a photographer sees the earth from an airplane. There he gets a bird's-eye view of the proper geographical relations of all parts of the community. He beholds the various roads leading to the congested parts of a city. He observes the causes of congestions not only when they have taken place but long before they take place.

Just so these sweeping investigations of industries, under one section of its act, give the commission a bird's-eye view of otherwise unseen things which go to prevent a free interplay of trade, or cause combinations in restraint of trade, price-fixing, and other artificial means damaging to the public, which frequently result in overselling the market and causing collapse of business and a further depressing reaction.

In addition, the commission was given a second power—to get a cross section of the market revealing the policies and attitude of business toward the public and the ultimate consumer, things which do not appear to the casual observer, but without knowledge of which the householder is helpless in her marketing and Congress is without the knowledge necessary properly to legislate. In this function where one competitor has attacked another and is seeking to control a commodity or restrict a competition by unlawful and unfair means, after investigating a case, the commission issues a complaint and summons the alleged offender to appear before it and show cause why he should not be prevented from carrying on the practices complained of.

Some Resist Decisions

THE exercise of these two functions, investigation and prevention, has caused great resistance on the part of some in the business world, although their exercise has been universally and strongly endorsed by our farmers, labor interests, and the housewives of America. From the investigation of the documents of many industries, I have found that there are honorable groups of business men in every industry who, though less articulate than others, have either believed in the exercise of these powers or have not been opposed to it.

The question naturally arises, why should there be opposition since the commission's order is an exceedingly mild one. The answer is that although it cannot put anyone in jail nor fine anybody, nor make anybody pay damages, nevertheless, its protection is sought as a city of refuge by those interests which are being attacked by predatory practices, and it has come to be dreaded by those who have offended, since the commission's orders and report throw the searchlight upon the acts of offenders in such a way that they cannot withstand the public opinion created by laying bare the facts.

The position in the business world occupied by the commission is similar to that of an umpire on a football field, who does not attempt to tell the teams how they shall play but penalizes when they play unfairly according to the rules which have been handed to him by an organization above him.

To co-operate with business the commission has devised a scheme which it calls a "trade practice submittal" where, upon a request of an industry, it invites them all to a common council and helps them to put their own house in order. But the Federal Trade Commission cannot successfully accommodate itself to such work until business men understand that they must first accommodate themselves to the conditions laid down in the law creating the commission.

I believe that if the commission can educate business to understand that the consumer has never in the history of the world been satisfied unless he has had the benefits of a market where competition gives him the best quality and the best service through a price obtained by fair competition between various interests seeking his business, it will have made great progress.

If business can also come to see that while natural growth is to be desired it cannot be acquired by one competitor absorbing or combining with another or practicing unfair methods of competition such as rebating, misbranding, false advertising, espionage, price-fixing, and so on, or by the artificial prevention of foodstuffs getting to the market or the unfair control of their distribution after they arrive there, then we shall have laid the proper foundation for peace and quiet in the mind both of the ultimate consumer and of the business world.

All this can be done by an umpire in the arena of business if the umpire is properly sustained in his efforts by public opinion. In such an arena every organization or individual will have the opportunity to display his business acumen and initiative and reap the harvest that is due him for the use of his God-given abilities, but he will not be dragged along through fear of some dominating group in the market, nor will he be held in check through price-fixing schemes with competitors that have been slothful or failed to take advantage of their rightful opportunities or to look into the future far enough to keep a reserve on hand with which to take care of pressing times.

Moreover, a market conscious of the presence of such an umpire will not indulge in practices which produce runaway prices, buyers' strikes and all other nervous conditions such as make for fluctuations and an irritated consuming world.

Greatest Grizzly Downed With Bow and Arrow

Western Sportsman Goes A-hunting Armed Only With Savage's Weapon

By ZOE PARKER

OUT on the Pacific Coast they are shooting grizzly bears, mountain lions, wildcats, coyotes, wolves, foxes, ducks and smaller game with the bow and arrow.

And Dr. Saxon T. Pope, well-known San Francisco surgeon and America's premier field archer, declares that this primitive hunting implement is the most sportsmanlike weapon ever invented. It gives the game a chance to pit its native cunning against the natural ingenuity of man.

Dr. Pope has returned from a hunting trip through the wilds of Humbolt County, California, where he bagged, with his companion, Captain Cassius H. Styles, a mountain lion, a lynx and other small game.

Mounted in the Academy of Science, Golden Gate Park, San Francisco, is the biggest grizzly bear ever killed (as far as there is any record), slain by Arthur T. Young, of that city, who with Dr. Pope bagged a male, a female and two cub grizzlies as specimens to be added to the museum's collection of mounted animals. The male tipped the scale at 1,000 pounds, while the female weighed 500 pounds. They were all slain with the bow and arrow.

Up and down the coast there is a revival of archery that indicates a throw-back to the sport of the savage. There are more archers in California than in any other state. Up in Washington, J. C. Albrecht, curator of the museum of natural history of the University of Washington, leads a group devoted to archery. Since he has abandoned the high-powered rifle for the bow and arrow he has slain a bison, Kodiac bears and bobcats, as well as smaller game.

The revival of archery, as far as Dr. Pope and the San Francisco group of archers are concerned, dates back to 1911, to the advent of Ishii, the last of the uncivilized Indians.

Ishii was captured at that time in the primitive wilderness of the Mount Lassen country, California, and taken to the Museum of Anthropology in San Francisco. There Dr. Pope came to know him in a professional way. The Indian, who had never before been in touch with the white man, had none of the disease-resisting germs with which to combat the white man's ills. He soon fell prey to pneumonia, though his entire previous life had been spent in the open without regard to weather conditions. Dr. Pope was called to attend him, and thus began a friendship which has resulted in the revival of archery on the coast.

Above—Arthur Young, companion of Dr. Saxon T. Pope, and the giant grizzly he killed with an arrow. This grizzly is the biggest ever killed in the United States, as far as there is any record. Below—Dr. Pope (right) and Mr. Young beside the female grizzly slain by Dr. Pope with an arrow. She died 20 seconds after being shot.

About Dr. Pope there has gathered a group of field archers whom he has interested in the sport. Prominent among these are W. J. Compton, Captain Styles, Arthur Young and Donnan Smith. These four with Dr. Pope are the best shots on the coast, though many others are rapidly acquiring great skill.

Hunting en masse this group has bagged 30 deer, at a range of from 40 to 125 yards, nine bears, and other wild animals in profusion. According to Dr. Pope the grizzly bear is the most dangerous animal hunted, though the mountain lion will fight when brought to bay. But to kill a grizzly bear the archer must be at close range, and if he wounds the bear it is almost certain to charge, which requires mighty prompt action or some speedy footwork.

Deer the archers kill only for meat. Frequently they stalk fine specimens of this animal, only to admire them and let them go. "Archery makes for cleaner sport," avers the doctor, "and we do not kill unnecessarily, except in the case of predatory animals such as bears, mountain lions, coyotes and the like."

Dr. Pope, America's premier field archer, and the trophy he won at the National Archers' tournament in Boston

Of the nine bears shot by this group six were killed in the Yellowstone Park by Dr. Pope and Arthur Young on the expedition to obtain specimens for the Golden Gate Park Museum. The park commissioners had obtained permission from the government to send a hunting party into the park. Dr. Pope and Young volunteered, agreeing to take only their bows and arrows. This pleased the sporting blood of the commissioners.

"Do not confuse the brown bears, known as the garbage-can bears, with grizzly bears, though," laughed the doctor. "We found our bears in the highest and most inaccessible peaks."

Ned Frost, the veteran guide of Cody, Wyoming, was secured to guide the hunters. He was skeptical of their ability to get bears with the bow and arrow, and took with him a .35 automatic rifle to be used in case of emergency. That rifle saved the lives of the three men.

The first group of bears they came upon numbered four, a mother and three cubs. At 25 yards Young shot an arrow into the mother, striking her in the chest. Dr. Pope placed another arrow in her foreleg. They each placed a second arrow in her. Then she charged and Frost fired at her with the rifle, knocking her over and saving the lives of the three men. Two more arrows were put into her and she fell over dead. The first arrow had pierced her lungs and the second arrow had passed through a part of her intestines. She was mortally wounded when she charged.

Dr. Pope killed one cub with a single arrow. The other two made their escape.

The archers were not satisfied with this bag. They had bargained to secure a family of male, female and two cubs. So they pushed still farther into the mountains in search of a male bear. Cody was left behind. Finally word was brought to them that a male bear had been seen rounding up elk near Dunraven Pass. They found his tracks which were 11 inches long. They built a blind and waited for him to reappear. On the fourth night a female and three cubs came down the trail toward them. Seeing an opportunity to get another cub each man nocked an arrow and waited. When the bears were within 40 yards they let the arrows fly. With a roar the bears came tumbling toward them. Just then the male bear appeared on the scene and there were five bears in sight.

Five lively bears were more than they had bargained for at one time, and the arrows began to fly. Young sent an arrow into the male bear and at the same time Dr. Pope let one fly at the female. The latter dropped over and was dead in less than 20 seconds. The men drove five arrows at the male bear, and then he got away.

One cub was found dead 100 yards away with an arrow through his head. One of Young's arrows could not be accounted for, so the men began to trail the male bear. They were able to follow him by splotches of blood. They came upon part of the arrow. Then they found the other half. It had been pulled out by the bear's teeth. Finally they came upon the bear, dead. One shot had killed him. The hole left by the arrow was clean-cut through 26 inches of solid bear meat. The animal weighed 1,000 pounds and stood seven and a half feet on his hind legs, the largest grizzly ever killed in the United States.

Of the six grizzlies killed on this trip with bow and arrow two were shot while charging, five were killed with one arrow and four were heart shots.

In hunting game with a bow and arrow there is a greater element of sport than in hunting with a gun. The approach must be made with extreme caution. One must be confident of his ability to shoot quick and straight. But once the arrow has hit the game its death is certain. In all other methods of hunting, two animals die in the bush for every one that is secured by the hunter, but with the arrow death at once is certain.

The arrows used by field archers can pierce a deer or bear.

In hunting mountain lions the hounds are used. To be a successful archer for this game you must run with the hounds. And while, according to Dr. Pope, this is a most exhilarating exercise, it requires a man to be in perfect physical condition to be able to do it.

Since Ishii's death Dr. Pope has been following the sport of archery continuously. He distinguishes between field archery and target archery, in which the western group is not particularly interested. Last year, however, the doctor won the cup at the National Archers' tournament in Boston. At that time he sent his arrow 286 yards, the longest flight on record. It was his first competition work, though a member of the national association, and it was the first time that the cup has been west of the Mississippi.

But it is in field archery that the doctor finds his greatest joy. He has always been a warm lover of all natural things and rather a misfit in the unnatural environments of civilization in which he must live. It was this love of nature which caused him to recognize in Ishii something more than a specimen to be studied. He sensed that here was a man with a philosophy and habits of life unspoiled by artificiality. A mutual feeling of respect sprang up between the primitive Indian and the cultured white man. Ishii taught Dr. Pope the use of the bow and arrow as the Indians used it.

Dr. Pope makes his bow of yew wood, six feet long, with a pull of from 75 to 80 pounds. The bowstring is of Irish linen waxed, with a strain of from 300 to 400 pounds. The arrows are of birch feathered with turkey feathers and tipped with steel heads nearly three inches long and one inch wide. These tips are sharp as daggers and cause instant death by hemorrhage.

On the foggy evenings so characteristic of the San Francisco Bay regions Dr. Pope sits by the fireside in his home making bows and arrows much as did Iagoo for Hiawatha. According to the legend, Iagoo

"Made a bow for Hiawatha,
From a branch of ash he made it,
From an oak bow made the arrows,
Tipped with flint and winged with feathers,
And the cord he made of deerskin."

Dr. Pope holes out! At the Presidio links, San Francisco, he plays archer's golf and makes his hole in one

Secretary Mellon on the Gold Standard

Holds That No Two Experts on Finance or Money Agree

By JAMES MARTIN MILLER

THE resources of the 30,846 banks of the United States, including the 12 Federal Reserve banks, amount to $55,330,215,000, or about one-quarter of the estimated wealth of the country. These banks are classified as follows: 8,249 national banks; 22,140 state banks, savings banks, trust company banks and private banks. The Controller of the Currency estimates that there are 445 private banks that made no report.

The resources of these banks, as stated above, in addition to the $40,341,600,000 of deposits, consist of $6,916,300,000 of capital paid in and surplus funds. Of this capital and surplus, the 12 reserve banks have $105,100,000 of capital, $217,700,000 of surplus and $2,191,700,000 of the deposits. The national banks show an increase of deposits in 1922 over 1921 of $901,000,000; the state and savings banks an increase of $1,365,600,000; the private banks an increase of $1,450,000. The Federal Reserve banks show a decrease in deposits of $325,700,000.

An Exhibit of the Financial Resources of the United States

Total deposits in all banks	$40,341,600,000
Capital and surplus	6,916,300,000
Value of real estate, of banks, equipments, and so on	8,072,315,000
Total resources of all banks	$55,330,215,000
Total deposits in all banks	$40,341,600,000
Total stock of money in the United States	8,177,447,105
Excess of bank deposits over stock of money	$32,164,152,895
Stock of gold in the U. S. Treasury	$ 3,784,651,712
*Excess of paper money over gold	4,392,795,393
Total stock of money	$ 8,177,447,105

Asset—or Liability?

IN VIEW of this statement, I said to the Honorable Andrew W. Mellon, Secretary of the Treasury: "Mr. Secretary, is the gold in the Treasury an asset or a liability?" The great secretary and successful financier did not even smile at this academic question, but reflected his temperament by replying calmly:

"There are no two so-called experts on money and finance in this country, or any other, that agree absolutely on questions of finance or money. They may agree, in a way, as regards certain fundamental principles on these questions. The gold in the Treasury of the United States might be called an asset and it could be called a liability. Only a very small portion of the gold in the Treasury actually belongs to the United States. For the most part, it is held against issues of paper money. The people who hold any of our paper money are simply in possession of warehouse receipts against this gold. This constitutes the circulation medium. The gold belongs to them. It is back of their money.

"The Federal Reserve banks have deposited with the Treasury (in the subtreasury, New York), nearly two-thirds of the gold in the Treasury against the Federal Reserve notes they issue, through the Treasury Department. Most of the balance is held in the Treasury against the paper money issued by the Treasury and now, for the most part, in circulation."

"Mr. Secretary, of course all of this outstanding paper money is payable in gold. If, for example, the people who hold this paper money, far in excess of the actual gold the Treasury has in its possession, should suddenly demand the gold, dollar for dollar, for their paper money, what would happen?"

"Yes, every dollar of it is payable in gold and anyone can bring or send his paper money to the Treasury and, upon demand, can receive the gold for it," said the Secretary. "But," he continued, "that may be put down as one of the impossibilities in practice, if not in theory. If all the policyholders in our strongest life insurance companies should die in one day, one month, or one year, these companies could not possibly meet their obligations. The expectancy of life figures in life insurance. It has come to be, practically speaking, an exact science. This, I think, should illustrate the practical workings of our monetary system. It is true the Treasury would not have gold enough to redeem it if all the holders of paper money should demand the gold for it suddenly, but there is no danger of this, not the least."

"Mr. Secretary, the banks of the United States show deposits of $40,341,600,000 and the total stock of money in the country amounts to only about one-fifth of the total deposits?"

"These excess deposits over money consist," said the Secretary, "of the notes and other obligations, often secured with good collateral, of responsible makers. As we well know, comparatively little actual money is used in business in these modern days. Aside from the pay rolls to our industrial people, and the business of the small retail stores, very little cash is used. Nearly everybody pays by check. While the bulk of the business of the country is done on the credit of the men and firms in business, the monetary system of the country is the basis for this credit, for it is the basis of the banks that supply the credit. The life insurance illustration applies again to the banks. These reservoirs of credit, and of money, must lend the resources of their institutions to the people and to the industries of the country to keep the wheels of business going. They could not live, neither could business continue, if the banks kept all their resources in their vaults expecting the depositors would all demand the balances to their credit in a day or a month. Then the banks would be of no value whatever, and business would stop."

The World War has practically destroyed, in nearly every European country, the system of monometallism, with gold as its basis. Now how can these countries get back on a gold basis? This is the question that is perplexing the experts on money and finance, both in Europe and the United States. In 1877, France, Belgium, Switzerland, Italy and Greece went from bimetallism to the gold standard. Germany had been exclusively on a silver basis until 1871, when that country adopted the gold standard. Now, as we all know, Germany is not on any standard.

Previous to the war, paper marks were redeemable in gold, the same as our paper dollars are now. The same was true of the paper franc in France, and in Belgium, and the paper lira in Italy. Now, the paper money cannot be exchanged for gold.

The United States, until the outbreak of the Civil War, had been legally upon a bimetallic basis. England began in 1717, when Sir Isaac Newton was master of the mint, gradually to adopt the gold standard. It was not wholly adopted, however, until 1870. Twenty years later, in 1890, the United States went on a gold basis. After the election of 1896, in which the campaign issue was "the free coinage of silver in the ratio of 16 to 1," the currency law of 1890 was still further strengthened, so that this country has been on a gold basis ever since.

Following our adoption of monometallism, silver coinage in India ceased, Japan a few years later adopted the gold standard, and Mexico went on a theoretical gold basis in 1905. In 1906 Brazil adopted the gold standard. So it will be seen that the gold standard of coinage has come about principally during the last half century.

The gold standard is arbitrarily fixed by law. Gold is the only commodity in the world on which the price does not fluctuate. You will read in the daily market reports that the prices of wheat, of zinc, of lead, of copper, of silver, and a thousand other commodities, change from day to day. Gold is the only article that is established at a fixed price. This never changes. Why? Only because its value, or price, is fixed by law. And this fact causes other commodities to fluctuate; prices rise or fall because everything is measured in terms of gold.

The Secretary of the Treasury and Colonel Frank White, Treasurer of the United States, both of them lifelong bankers, the former schooled in finance with big business at Pittsburgh and New York, the latter securing his financial training as a banker in North Dakota. Each admitted, in discussing this question with the writer, that Congress could enact laws that would make wheat, corn, coal, silver, lead or any other article, have a fixed standard of value just as gold has today. I am only stating a generally conceded fact here, and am not essaying to produce an argument for or against the gold standard.

Eighteen Billions of Gold Mined

THE United States Mint Bureau estimates that the outturn of gold, since the discovery of America, has not been more than $18,000,000,000 in value. The money stocks in all the countries of the world have never amounted to more than $8,500,000,000 in value of the precious metal. The United States now possesses nearly one-half of this visible gold money stock. The great bulk of the gold held by the Treasury is in the shape of gold bars. Comparatively little gold is now coined into money. The world consumes about $100,000,000 worth of gold each year in the industrial arts. Even gold coins are melted up and used industrially. It was the fear on the part of financiers that if much gold was circulated in the shape of coins it would rapidly disappear, in industry, and that eventually there would not be a sufficient supply to maintain the gold standard in our monetary system. Those in charge of the finances of the country were greatly agitated about this question. This throws an interesting side light on the once much-discussed question: "What becomes of the gold?" It is quite apparent that the share of world gold utilized for other than monetary purposes was larger than usually supposed in the years gone by. Authorities tell us that there is considerable gold hoarded away, by hiding it. While little or nothing has ever been printed about it, one of the reasons for reducing to the lowest possible minimum the coining and circulation of gold as money was undoubtedly the fear that it would disappear at a more rapid rate than the mines could produce, thus causing such a shortage eventually that there would not remain a sufficient supply on which to base our monetary system. Instead of using gold coin we issue paper money against the gold bullion in the Treasury. It is true that paper money is far more convenient in every day use than metal money, except for subsidiary coins.

The unit in weighing gold is the troy ounce. A "fine" ounce means an ounce of pure gold. Under the law, the mint value of gold does not fluctuate but remains constant, under all kinds of conditions, at $20.67183462 per fine ounce. So it will be seen that everything else, when it comes to valuations, must bow to gold; it is the sole arbiter and price fixer.

Only $200,336,150 of the $3,784,651,712 in the Treasury actually belongs to the United States Government. The bulk of the gold, or $2,861,105,180 of it, is deposited in the subtreasury at New York by the Federal Reserve banks for the purpose of issuing Federal Reserve notes against it. There is a difference between Federal Reserve notes and Federal Reserve bank notes. The latter are issued against government bonds, as are national bank notes. Federal Reserve notes are issued against gold. The reserve is theretically 40 per cent. There are few Federal Reserve bank notes as compared with Federal Reserve notes. There are now more of the latter in circulation than all other kinds of paper money.

There are now six different kinds of paper money. Many financial experts believe there should be a standardized system of issuing paper money; in other words, there should be only one kind, or design, of bills for all denominations. It costs about one and one-half cents to produce each bill regardless of whether it is a one dollar, a hundred dollar, or a thousand dollar bill. The Federal Reserve banks and the national banks, however, pay this when the money is printed for them. Gold notes and other Treasury issues, of course, are paid for, as to their making, by the government. A standardized currency, it is contended, would be in the interests of economy and make it much more difficult for counterfeiters to pass their bogus money. The involved complications at the Bureau of Printing and Engraving, and at the Treasury Department, as well as at the banks, would be greatly simplified if only one kind of paper money were issued.

The work of the Redemption Division of the Treasury Department is an important one. Banks that have been out of existence for many years still have money outstanding. As it comes in, it is redeemed. Some time ago the Redemption Division charged off $13,218,000.45 of money that was declared lost. There is, according to estimates by the Treasury Department, fully $20,000,000 of outstanding money that is unaccounted for and is considered lost. The government is ahead just that much.

Some Facts About Our Money

MANY people have strange notions about money. Misers sometimes bury their money, or hide it away and never divulge to their nearest relatives the secret as to its whereabouts. If such a person dies suddenly his hidden money is likely never to be found. Fire and flood destroy money. Of the thousands of dollars, on the persons of those lost when the Titanic and the Lusitania went down in mid-ocean several years ago the exact amount can never be known accurately. In these days United States money is carried by travelers all over the world, often into the most remote and uncivilized countries. It is known that a great deal is lost by such travelers.

The other day an interest-bearing $10 bill came into the Treasury Department for redemption. It cost the government $21.20 cents; $10 principal and $11.20 interest for the many years it was out. During and after the Civil War, the government issued interest-bearing paper money. Some of it called for compound interest. Some of these notes contained interest coupons, the same as bonds. Other issues simply had the interest provision printed on the face of the notes. These interest-bearing notes are among the relics in the vaults of the Treasury Department. At long intervals, however, one or more of these notes will drift into the Treasury Department; then principal and interest are paid in full.

In accordance with the provisions of section 25 of the Federal Reserve Act, "any national banking association possessing a capital and surplus of $1,000,000 or more may, with the approval of the Federal Reserve Board, establish branches in foreign countries or insular possessions of the United States for the furtherance of the commerce of the United States, and to act, if required to do so, as fiscal agents of the United States." Only two national banks have taken advantage of this provision of the law, namely, the First National of Boston and the National City of New York. The latter has opened 25 branches in Cuba, three in Brazil, two in Argentina, two in Belgium, two in Chile, two in Porto Rico, one in Colombia, one in England, one in France, one in Italy, one in Peru, one in Uruguay and one in Venezuela. The First National Bank of Boston opened up only one foreign branch, at Buenos Aires, Argentina. It is necessary now for the Controller of the Currency to send National Bank Examiners to the countries named to examine the foreign branches. These foreign branches made loans in 1922 of $142,555,000.

Since 1793, up to June 30, 1922, our mints have coined $44,401,955.27 worth of pennies, or one cent pieces; $42,242,951.00 of these are outstanding and in circulation, assuming that none of them have been lost or destroyed. The difference between the number coined and the number outstanding, as above, of $2,159,004.27, represents the number of pennies that have been returned to the three mints and melted.

The value of the nickels, or five-cent pieces, outstanding or in circulation, amounts to $54,836,416. In addition to this, $5,127,746.05 of the five-cent pieces coined have been returned to the mints and melted.

In addition to pennies and nickels, there are $2,466,220.61 outstanding in copper half cents, two-cent pieces and three-cent pieces, the two cents made of bronze and the three cents of nickel.

There is $863,389,318 of gold coin in the United States; $381,174,404 of silver dollar coin; and $271,210,886 of subsidiary coin, such as dimes, quarters and half-dollars.

---

*A comparatively small portion of this money consists of subsidiary coin.

Where Welfare Work Pays Big Dividends

Southern Corporation Does Much to Better Conditions of Negro Workers

By HELEN BETHEA

The little sunflowers are rolling their eyeballs with delight at the prospect of having their pictures made.

Little bungalows, artistically designed, and each one different, make up the village of Westfield.

Russia's complexion, while somewhat darker in the colored May Festival than it is popularly supposed to be, did not detract from the effect of the Russian Dance by the sixth grade boys and girls.

MANY things have been accomplished for the southern Negro in industry by the Tennessee Coal, Iron & Railroad Company, subsidiary of the United States Steel Corporation, in the last few years. The Tennessee company operates in the Birmingham, Alabama, industrial zone, operating coal and ore mines and furnaces and steel fabricating plants. Through its social science department the company is doing the work on a large scale, having introduced a system of home education and recreation.

The work is having a far-reaching effect on the social life of the Negroes throughout the South. Under the influence of those who have lived and been trained in the T. C. I. towns, organized social efforts of various kinds are springing up among the Negroes in other localities every day.

Miss Winifred Collins, director of the Social Science Department, has charge of the work. She is the official "housekeeper" of the company home. Hers is the task of keeping the many parts of the company body working harmoniously together. She furnishes the feminine element that other officials of the organization found necessary to the best interests of the actual industrial work. From an office high up in a tall building in Birmingham, Miss Collins touches the buttons which make the social "wheels" of the 10 little towns revolve, just as the other officials set the wheels of steel and iron to moving in the other departments. She has charge of the work in an equal number of towns inhabited by white people which she runs on somewhat similar lines. The work of the social science department reaches every community in which the company operates, giving special attention to the ones located in the more remote sections.

Working directly under Miss Collins are the division superintendents who have charge of the work in various divisions, each one including several towns. For each town there is a white community director who is responsible for the activities in that village. Living in the village and coming in daily contact with people are two community workers—a man and a woman. They have the general supervision of the work carried on in the towns by the teachers and trained workers, some of whom live in the towns, while others go from one community to the other.

"We believe that the smallest possible amount of restraint and the greatest good can be obtained by employing directors and instructors of their own color for the Negroes," said Miss Collins. "We have placed Negro graduates from accredited schools and colleges in every town. Since the actual work has been carried on by colored teachers and workers we have found that it has progressed a great deal more rapidly."

Every town is furnished with adequate school facilities, kindergarten rooms, a community house and a club house for the activities of the men. There are athletic fields, where the annual sporting events between the communities are staged.

"We find that our athletic events are among our most valuable assets with our employes, for they promote a friendly rivalry with other divisions of the company, which in turn engenders loyalty for the company," said Miss Collins. "We stage every year a baseball series, a football series, a soccer series and a basket ball series, making an all-year-round program, leaving not a single season without inter-community athletic activities.

"The fact that they are drawn together to witness these athletic events gives the men the feeling that they are a part of a great pulsing, living entity, which is vivid with interest and enthusiasm for the things that the integral parts are doing. It would be impossible to stop a feeling of warmth from growing in the hearts of a multitude of employes who are gathered together to see the "manufacturing" division play off the championship game with the "mining" division of the same company.

"The African is both elemental and temperamental as a rule," Miss Collins continued. "He responds quickly to things that are done for him. He is equally quick to absorb any feeling of discontent which may be going the rounds. Hence we believe that the social science department is the strongest ally we have against the strike evil. We must constantly fight, for these people, the feeling of despondency that is the natural result of difficult working conditions. We must keep them filled with the belief that life is worth living, even when one-third of it must be spent in the subterranean fastness of a mine, or in the burning breath of a furnace.

"Our main duty is to furnish the people with recreations and diversions which are both healthy and profitable. The effort is to lift the minds of the laborer above his everyday tasks, for physical labor exhausts the body without satisfying the mind of the average person.

"For the men we have the athletic activities. For the women there are schools, improvement associations, better baby campaigns, health crusades, church work meetings, cooking classes, housekeeping classes and clubs for literary and social betterment. Sports, with music and dances every week, furnish recreation for the growing energy of the young folks. The boys are taught the manual arts and the girls are taught the domestic arts. There are complete shops for the boys, and for the girls a cottage, built like the ones the people live in, is given over to the domestic science classes in each town."

The religious life of the people is encouraged. Two or more churches are located in each town. The Negro is especially susceptible to the influences of religion and responds to its appeal more readily than white people do. In this province the social science department practices the "hands off" policy.

Noticeable in the workings of the social science department is the absence of the paternal attitude. The supervisors and teachers who have charge of the work never assume any authority, except, of course, in the school class rooms. In their dealings with the older people they suggest rather than instruct, and advise rather than direct.

Even in the architecture of the homes in the T. C. I. villages one notices a departure from the old order of things. The day of the "company village," where every house is an exact copy of all of its neighbors, has passed, even in the colored towns. Modern bungalows with a definite plan of architecture and adornment have been erected. Every little house has a style all its own. All of them have one thing in common, convenience and good sanitary arrangements.

"Home Gardening and the Town Beautiful" is one of the chief movements that the social science department fosters. Today when the traveler makes his way through rural North Alabama he sees, instead of the little mining camp held by main force of the will of the corporation to the side of a red ore-grimed, dusty hill, a little village blooming with flower gardens, nestling down at the foot of the steep hill. About three-fourths of the way up the mountain, where the camp used to be, the mine still yawns and the little tram trains run importantly in and out.

In the manufacturing centers the homes for the workmen are built far enough away from the breath of the hot mills to make living possible, with a reasonable amount of comfort even in the middle of the summer.

In May of every year, the social work of the colored T. C. I. communities reaches a climax in the May Festival held at Westfield where the main athletic field is located.

Last year 12,000 colored men and women gathered there from all sections of the company holdings to view with pride the antics of the 2,000 school children who took part in the event. This annual performance is staged by the pupils in the colored schools of these villages: Bayview, Blocton, Docena, Edgewater, Ensley, Ishkooda, Ketona, Muscoda, Wenonah and Westfield.

The gigantic pageant proceeds to the coronation of the May queen with but a thread of story on which to hang the music and dancing. A Negro band of 36 pieces, organized and trained at Edgewater, one of the company's most inaccessible villages, furnished the music. The most popular girl and boy in the whole school system were chosen by the majority vote of the other pupils to be king and queen of the festival.

To be the queen of the May Festival is the most coveted social distinction that can be awarded to any girl in the communities. For the day the May Queen is the cynosure of the eyes of the dark town system and hers is the pinnacle of social success. The honor is one for which the girls in every school strive openly, aided and abetted by their mothers and all their female relatives.

All the children take part in the dances and drills which are a part of the pageant. Every inhabitant of the flower kingdom and every nation of the earth is represented in the many spectacular scenes which are put on. The nymph which links all of these together is the Spirit of Spring. Second only to the honor of being May Queen is that of being the Spirit of Spring. This is awarded by the athletic instructor to the girl who is the best interpretative dancer and also the best student. It is really the principal part in the pageant and some people value it even above the distinction of being elected queen.

"The construction of the villages, the work of this department, the whole system, in so far as it is possible, is planned, like the system in a home, for the convenience and welfare of the workers," said Miss Collins. "Millions in money and many years of time have been spent to produce the best possible living conditions for them.

"The element of charity does not enter into this phase of the work of the Tennessee company. It is purely a matter of economic expediency and good sense. The company has discovered that money spent for the keeping of a 'clean house' in the industrial centers, and a department devoted entirely to the welfare of the workers and their families pays actual dividends in the service and loyalty shown in all other departments.

If the Bible was a part of one's childhood, one will be conscious of a quotation that just fits:

"Inasmuch as ye have done it unto one of the least of these, ye have done it unto Me."

John Burroughs as a Critic of Literature

Concluded from page 3

Emerson and the rest of them? How has it fared with so many names in the past, that were in their own day on all men's tongues?"

I believe that the public mind is always and ever endeavoring to get the correct estimate and measure of men and of women, but that quite generally this estimate and measure is elusive or slips from the grasp. Earlier literary judgments are at their worst if made before a writer has produced very much, and are certain to be over or under estimations. Twenty-five years ago we might have been justified in the belief that John Fox's final position as a novelist would have been a high one. And there have been scores of others! Later production did not equal in quality or did not please as had earlier efforts, and they are forgotten in just the way that John Burroughs indicates is likely to be the case with many who deserve a larger place than will finally be accorded to them.

"Literary Values" is sure to make upon the minds of most persons who had read it with care that type of influence which will cause them in their future reading to seek that which is worth while rather than the type of writing which bears the sign, almost before it is read, of being the passing comment—the quickly forgotten. And the book is most helpful to those who will study and ponder what he has written for they will be much better able to judge the true from the unreal and to separate the false from the true.

WAITING—By JOHN BURROUGHS

Serene, I fold my hands and wait,
Nor care for wind, nor tide, nor sea;
I rave no more 'gainst Time or Fate,
For lo! my own shall come to me.

I stay my haste, I make delays,
For what avails this eager pace?
I stand amid th' eternal ways,
And what is mine shall know my face.

Asleep, awake, by night or day,
The friends I seek are seeking me;
No wind can drive my bark astray,
Nor change the tide of destiny.

What matter if I stand alone?
I wait with joy the coming years;
My heart shall reap where it hath sown,
And garner up its fruit of tears.

The waters know their own and draw
The brook that springs in yonder heights;
So flows the good with equal law
Unto the soul of pure delights.

The stars come nightly to the sky,
The tidal wave comes to the sea;
Nor time, nor space, nor deep, nor high,
Can keep my own away from me.

"I suppose one comes to like plain literature as he comes to like plain clothes, plain manners, simple living. What grows with us is the taste for the genuine, the real. The less a writer's style takes thought of itself, the better we like it. The less his dress, his equipage, his house, concern themselves about appearances, the more we are pleased with them. Let the purpose be entirely serious, and let the seriousness be pushed till it suggests the heroic; that is what we crave as we grow older and tire of the vanities and shams of the world. * * * See how much better literature Lincoln's speech at Gettysburg is than the more elaborate and scholarly address of Everett on the same occasion. General Grant's Memoirs have a higher literary value than those of any other general of our Civil War, mainly because of the greater simplicity, seriousness and directness of the personality they reveal. There is no more vanity and make-believe in the book than there was in the man. * * * Lincoln and Grant were undoubtedly the two most elemental men brought out by the war."

John Burroughs, the literary critic, is never detached from John Burroughs the naturalist. We find the vein the same; the style is identical and we have here the same aim and the same purpose. There is ever and always that going after the truth, of getting to the heart of the matter without show or the idle waste of words. He does more than merely tell us that Lincoln and Grant were elemental. He is so himself. Therefore what he writes is not mere idle preaching.

So long ago as 1871 John Burroughs was constantly writing. That was at a time when he was a government clerk in Washington, and while in the midst of his Whitman friendship. "Wake Robin" and "Winter Sunshine," his two earlier books, are as thoughtful and as penetrating in the treatment of their subjects as his later work. He does not show in them the influences which his own more mature study of literature was destined to have upon the work of the more fully developed and better equipped John Burroughs.

He has recounted that as early as 1862 Brownlee Brown, "a sort of refined and spiritualized Emerson, without the grip and gristle of the matter but very pleasing and suggestive," was attracting his attention. The same was likewise true of Davis A. Wasson, a New England writer of the somewhat smaller Emerson type and who is now quite forgotten. John Burroughs had studied Locke, Johnson and Saint-Pierre who he thought "left their marks upon me."

Carlyle was the first writer to take a deep hold upon John Burroughs after he reached his maturity. He declared that to say Carlyle is not a great writer, or more than that, a supreme literary artist, was to him like denying that Angelo and Rembrandt were great painters or that the sea is not a great body of water. Carlyle's life meant to John Burroughs a life of herculean labor, being as it was entirely given to letters. To his way of thinking, Carlyle brought to his tasks the greatest single equipment of pure literary talent English prose has ever received.

Emerson a little later came crowding into John Burroughs' reading thought. In his third volume, "Birds and Poets," Emerson is given a large place. "The National New England type, as illustrated by that section of the country, is the purest and strongest in him of any yet. He can never suffer eclipse." John Burroughs looked upon Emerson as "an essence, a condensation; more so perhaps than any other man who has appeared in literature. He gives us net results. He writes short but pregnant chapters on great themes, as his 'English Traits,' a book like rich preserves put up pound for pound, a pound of Emerson to every pound of John Bull. Apparently he does not permit himself a moment's indifference or inattention."

Emerson must have deeply pleased him. His chapter with the New England philosopher as his subject was his first getting away with his pen from nature-writing.

From that time onward a considerable part of what John Burroughs has written has been upon literary topics. It would appear that from Emerson he took his form of expression: the essay—a form in which we always find his prose work and a form which he has been wise in adhering to since it is so clearly his forte.

It seems to me clear that, as far as Walt Whitman is concerned, John Burroughs has done more than any other one agency to give us the correct estimate of this poet. Whitman needed someone who knew him and understood him to explain him. John Burroughs finally made the discovery that Whitman cannot be explained—that the only way to approach him is to study him and this he has done thoroughly and well. As he says, Whitman's life was "a pleased and interested saunter through the world—no hurry, no strife; hence no bitterness, no depletion, no wasted energies." These few words alone have helped those who have read them to understand Whitman better.

Taken all in all, however, "Literary Values" holds perhaps more of real interest to those who are in quest of the stable, the lasting, the enduring in literature and desire to get away from the trivial than does any other modern volume. This may seem high praise, especially when bestowed upon a man whom nine-tenths of the world seems to know and to want to know only as a naturalist and as an author dealing with nature and nature only. But the way is open to those who will read to find in John Burroughs one of our very best and certainly our most delightful of literary critics.

The New Jersey Colony of the Easter People

Concluded from page 7

wheel was in several places cut through slate rock to a depth of 15 feet or more. At these points this artificial waterway has the appearance of a miniature chasm. The mill, the dam forming the pond, and that water channel have today the precise appearance which they had when completed nearly a century and a half ago.

The Moravian colony was possessed of the Continental idea as to how farmers could best live. The general plan was to dwell in a central village—we see this plan followed in many parts of French Canada today—with many of the farms at some little distance. This necessitated in some cases rather long walks—going in the morning to the farms during the plowing and harvesting seasons and equally long return journeys in the evening. But the plan did away with the monotony of the winter. It made possible a pleasant community with every possible advantage for social intercourse during a season which otherwise would have been unbearably dull.

Here the Moravians dwelt for 39 years. So far as known none of these people were ever involved in trouble which enlisted the aid of the courts. Nor were any ever charged with the commission of any crime. Theirs was a case actually of living at peace with mankind.

In 1787 Joseph Swayze, an old pioneer in that region, proposed building another mill but the stewards of the church and congregation addressed him a fervent letter and requested him not to carry the enterprise into effect. Here is a part of the entreaty:

"We, therefore, dear friend, would earnestly ask and beg you to consider the affair in its inner light and if you show that sincerely and with compassionate mind, you will find—first, At what a great expense we have been in bringing our mill, in order to serve the neighborhood, as commodious as can be; and second, What great benefit the neighborhood derived these 17 years past of this mill; and here we must needs inform you that all of the income of the mill as well as all the rest of our trading, after the homeward expenses are discharged, are wholly and solely accounted to the benefit of the Gospel, to promote the same among Christians and Heathens, and especially for the support of our Missionaries amongst the Heathens; and whosoever get acquainted with and knows it, what an Ocean of expense the Brethren are at to maintain these missions in all parts of the world, will and must give the praise to our Lord and Saviour of Heathen, who hath brought to their Eternal Salvation many thousands of them, and admire how wonderfully he has assisted us to discharge all its immense expenses occurring by that undertaking. * * * Now dear neighbor, these our minds which we have communicated to you, flow not out of hearts of hatred against you, but more out of grevious foresight, that our Mill will be out of its recourse and in future contribute but little to the above mentioned expenses, and we beg your pardon, and hope you will not take it amiss of us, as shall still remain your well-wishing friends and neighbors."

Queer triple-sectioned arches known as "Widow Pailows" abound throughout China. The Chinese idea of virtue in a wife is one that does not remarry after her husband dies and who gives the remainder of her life to caring for her father-in-law and mother-in-law; she will then be honored with an arch or "Widow Pailow." A husband may remarry.

The names which were signed to this entreaty were Frederick Linebach, Bernard Ad Grube, Daniel Hauser, Adolph Hartmann and John Luckenbach.

The Moravians had not found the soil about Hope so fertile as they supposed. Their colony had endured the Revolutionary War practically undisturbed. At the end of the winter 1807-1808, a season remarkable for its rigor in the history of the middle Atlantic states, it was decided by those at Hope that they would move—that with the coming of spring they would return to Bethlehem and to Nazareth.

It has been testified on every hand that these people were remarkably honest in their dealings. They had, by trusting too much to the fair treatment by others with whom they had come into business contact, suffered sadly. The colony had not prospered.

Easter Monday, 1808, the time set for their departure, witnessed in the village a scene strange indeed. Here on stout wagons were placed the furniture and belongings that had been brought upon their arrival. Their homes and lands they had sold to whoever would purchase and in horse-drawn vehicles, the day after the Easter services, which form such a large part of the church life of these people, they started away from the village they had built and the place they loved!

A good many of the Moravians—all those who died at Hope—lie buried in what is now the Methodist Episcopal cemetery. The evidences of their having lived and having labored here have been in nearly every case obliterated by the hand of time. Only here and there can be seen little sections of gray slabs which were placed flat upon the graves. Most of them are completely hidden by the sod and the earth which now cover them.

The real evidence that another people, speaking another language and possessed of other customs, habits and religious views once dwelt in that region is confined to the substantial structures which they have left.

Spending Hetty Green's Millions on Radio

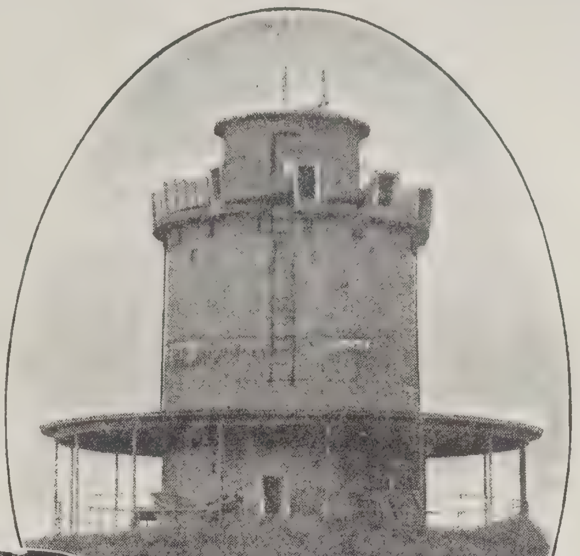
Builds Huge Station at Buzzards Bay, Massachusetts, to Help Amateurs in Their Wireless Telephony Experiments

By F. N. HOLLINGSWORTH

IF HETTY GREEN were alive, she would be amazed at the uses to which have been put the millions of dollars that she accumulated by hard work, strict attention to business and shrewd investment during the course of her long life, leaving her, just before her death, the richest woman in the world. And yet she probably would be pleased, for the millions are being devoted to worthy, yet practical uses (and Hetty Green was eminently practical) by her son, Colonel Edward H. R. Green, who is so crippled that he cannot get around actively like many poor young men whom he plans to help.

Colonel Green is one of the most enthusiastic of the many thousand radio devotees who dot the United States and Canada with their little stations.

On his estate of 253 acres known as "Round Hills" at South Dartmouth, Massachusetts, about eight miles from New Bedford and on the wind-swept shore of Buzzards Bay, he has a home where he is building the biggest amateur experimental station for radio in the world. He already has a powerful broadcasting station, and is building another; a big loud-speaker tower which sends music for miles, and one of the finest radio laboratories to be found anywhere. Here he keeps open house for the amateur radio fan, welcoming him and offering him free use of the facilities afforded by the laboratory, the paid engineering staff and the great quantities of radio apparatus.



The unique loud-speaker tower, on a bluff overlooking the bay at Round Hills, equipped with large wooden horns. Broadcasts are sent through these horns far out in the country and may be heard without a receiving set at a distance of four and one-half miles.

Photos by Boston Photo News Co.

COL. EDWARD H. R. GREEN,

The "Multimillionaire Radio Bug," in his study at Round Hills.

Skilled engineers, leading radio men and highly trained workmen of all kinds are now busy erecting on the Round Hills estate a new set of broadcasting, reception and experimental stations that will be among the most powerful, and none for profit. Whatever discoveries are made will be given over to the discoverers, if they are not connected with the plant, and choose to benefit by the discoveries; otherwise to the radio public.

Colonel Green believes that the future of radio lies much in the hands of the enthusiastic amateur, who will spend days and nights working over some little problem, testing and experimenting for the sheer fascination of the thing, without thought of ultimate profit. Some of these amateurs may have brilliant ideas, but, through lack of means, may be unable to carry out their ideas. He intends to aid these enthusiasts.

He expects to have everything in readiness by next June, by which time school will be closed and those students interested can give their vacation to radio. A picked staff of instructors and radio experts will lecture and teach the advanced science. Others will be given a chance to test, without cost, theories or ideas they seek to develop. Expert experimental work will be going on and any radio fan will have an opportunity to witness or participate in a part, at least, of these experiments and tests.

Colonel Green will offer a prize of $5,000 and will put up a gold cup, both to be awarded to the amateur who is judged as having furnished the idea that has advanced radio the farthest during the preceding year.

There will be a second prize of $2,000 and a silver cup going to the next best idea. A second plan will be to send out a call to amateurs, offering the free use of his tremendously efficient and powerful plant in the furtherance of amateur work and for amateur experimental purposes. Thus an amateur may bring his set to Colonel Green and may try it out on one of the stations under construction.

The third plan is for the college professor, who, handicapped perhaps by a small salary, though brilliant and prolific in ideas, is unable to carry on any experimental work outside of his classroom. In the spring he will send out a call to professors to visit Round Hills if they desire. Those, who after being given a hearing are found to have feasible ideas, will be placed on Colonel Green's pay roll and maintained for as long a time as they need to conduct their experiments.

They may either build their own sets from materials furnished by Colonel Green, or have the sets built by his engineers according to their own specifications and under their own direction.

His loud-speaking tower is unique and is developed from Colonel Green's own ideas. The tower looks like an old-fashioned Atlantic Coast lighthouse, and on the gallery of the tower are mounted four large wooden horns. Connection is had with the studio, a short distance away, where the amplifying apparatus is located. This reproduces music and speech with such intensity that it is directed through the horns for a distance of four and a half miles, with distinctness and modulation. Yachting and fishing parties far out in the bay have heard the broadcast and wondered whence it came.

The four great steel masts to be used in the broadcasting station and the four wooden ones now in use can be seen for miles before one reaches the estate.

The big sun parlor of the mansion has been turned into a private radio laboratory, filled with all sorts of apparatus. It might be the radio amateur's idea of heaven, with its profusion of amplifiers, receiving sets, loud speakers and transmitting sets scattered about.

Just outside the house is a pair of 100-foot steel towers which will be used for the new 500-watt station now being constructed near by. Transmitting tests are now being made on a 100-watt station, about a quarter of a mile away. This carries an "A" license, while the new station will carry a "B" license. Both will have the station call of WMAF.

"It is pure selfishness," said Colonel Green in speaking of his radio plans and his experiments. "I am interested in the thing for the pleasure it gives me. I believe, however, that the pleasure afforded by the radiophone should be accessible to every man—not only the rich, who can have the best of apparatus, but to the poor man who must obtain his outfit at a low price or not at all.

"My aim is to hasten the advent of a low-priced receiving set not to cost more than $25 at the most, all complete, which will be really sensitive, reliable and simple to operate. When the majority of people are contented, wars and strikes will be unknown. The way to keep them contented is to keep them entertained in their homes, and the radiophone does that better than any other agency I know of. If I can hasten the day when every home will be equipped with a radio receiver, I will be content myself.

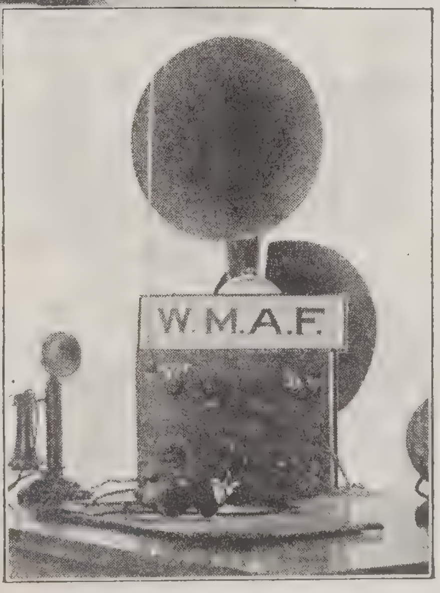
"Our experimental station call is IXV. This will take care of nine different transmitting stations. Our broadcast call is WMAF. This carries the 50, the 100 and 500-watt stations. We are having these stations built for experimental purposes only. We have 18 orders out now for types of loop aerials that have any difference between them. What we are after is the practical loop aerial, and we will test them all, to see which is the best.

"At present we have four steel masts, each 146 feet high, erected to carry antennae. Then we have eight wooden masts, 125 feet high, and there are three 12-foot loop aerials.

"The Round Hills station is out for quality, not quantity, and we have a unique system for receiving our broadcasts back by telephone and thereby judging of their quality. At various places on Cape Cod and in other sections, including one in New York City, receiving sets have been distributed and others will be distributed to receive the Round Hills broadcast. Then through the telephone the broadcast reception will be returned to Round Hills house and listened to here. Thus we will be able to judge of the quality of our broadcasts and not be obliged to depend upon reports from others. One of these receiving sets has been installed in the life-saving station at Cuttyhunk and another at Broadway and 42nd street, New York City.

"We have found that the tides affect the wave length. Once at the house here I got a terrible reception from our own broadcast and called up the broadcast building to see if they were still on the same wave length. Finding that they were, I instructed them to investigate. Finally they found that the tide had dropped four feet since the broadcasting had begun, and this drop had changed the wave length.

"We are having a band room prepared, with a different type of transmitter from that used for soft music or the human voice. The latter will not go through it, but a brass band with a bass drum, which usually sounds badly, will go out beautifully on the new transmitter. We will have a special microphone for each station; one type for voice, another for the organ and another for band music. Whatever we do will be either for quality or for experiment. To anyone who listens in on our broadcast of 400 meters, the result will be either excellent or rotten."



The private receiving set of Col. Green in his mansion at Round Hills, with the letters of the Round Hills broadcast station call.

Once a year the station will publish articles giving full details of all that has been discovered during the previous year and this will be available for general use.

"We are not going to do the way the big telephone, electric and radio companies do," said the Colonel—"buy up new ideas and patents and quietly shelve them because they are such radical improvements that they would have to scrap hundreds of thousands of dollars' worth of apparatus already made up to sell. We are going to give the boys a chance to put their ideas and inventions before the public.

"We shall institute a prize contest with a board of judges made up of a representative of the newspapers, one from the colleges, one of the amateur radio men, one from the engineering societies and one representing the Round Hills Corporation, to act as a board of five judges. Then we shall invite amateurs throughout the world to submit their ideas to the board. The prizes will be awarded as previously stated, except that the cups will have to be won twice by the same men to become their property."

The mystery of Colonel Green's interest in radio is no mystery at all when the facts are known. He became a "bug" back in 1898, but through pressure of business was obliged to drop it. Not long ago, when on a sick bed down in Texas, he took it up again, to while away the empty hours while convalescing.

BRIEFLY TOLD

A baseball rookie from St. Louis on his first visit to Philadelphia was shown the Liberty Bell. Looking it over, he said, "It's too bad to let a relic like that run down. We've got a blacksmith down home who could fix that crack up so you wouldn't know it ever had been there, and he'd do the job for $5."

The original French of the now stale Coué refrain is: "Chaque jour aux toutes façons je vais mieux en mieux." The rhyme, in English, is accidental; its success monumental.

In Portsmouth, New Hampshire, there is an old mansion which retains the lightning rods put up by Benjamin Franklin in person. On the same street is an old church, St. John's, from which rings out the pleasant peals of a bell of Paul Revere's handiwork.

A mock trial took place at the Garrison Club, Moscow, on January 27, in which God figured as the accused, according to dispatches from that city. Five thousand Red Army officers and soldiers witnessed the trial, Leon Trotzky and Secretary Lunatsharsky participating. Evidence was presented for and against God, as a counter-revolutionary power, and speeches delivered by the "defense" and the "prosecution." At the end of the proceedings a verdict of "guilty" was announced.

More land is cultivated to grow the world's wheat than to grow any other single crop. If all plant life in the world except grasses, of which family wheat is a member, were destroyed, man and his animals could still live.

Contrary to popular belief, the century plant (Agave Americana) blossoms once in eight years in most cases, and not every hundred years as many have been led to believe. A central shoot nearly 20 feet high often bears as many as 4,000 blossoms. Those growing in greenhouses or under artificial conditions do not bloom so often as those growing naturally.

Fox farming in Alaska utilizes material from salmon canneries that would otherwise be wasted.

Paraffin wax mixed in benzine is used in preserving many of the relics found in Tutankhamen's tomb. The surface of the relics are also sprayed with a diluted solution of celluloid dissolved in a mixture of amylacetate and acetone. Other relics are coated with a heavy coat of paraffin wax which may be removed by heat. The leather goods is found to be black, brittle and resinous-like, breaking into small fragments when touched.

For jobs of large bulk such as the unloading or loading of great quantities of brick and sand between car and ship, car and storage, and so on, the conveyor belt has proved to be cheaper than the cheap labor of India.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Copra is the dried kernel of the ripe cocoanut. About seven years is required to bring a cocoanut tree to bearing age. The trees need little attention and the price paid for copra is about $150 a ton "on the beach." A good tree will produce annually 300 cocoanuts. Fifteen hundred nuts make a ton.

You rarely lose anything in Japan, according to American travelers. If you leave your pocketbook or camera on the train or in the street car, you will be sure to find them when you go to the proper place for lost articles.

The average cost of stopping a freight train is 24 cents at five miles an hour; 69 cents at 10 miles, and $1.44 at 15 miles an hour.

Verses by Milton written when he was 14 years of age have been found in a seventh century copy of Ovid picked up in a secondhand shop in London. Handwriting experts have identified the manuscript poems as Milton's, and the date in the book indicates the great poet wrote them when he was but a child.

More than 1,200 holes were made in one stroke by golfers during the season of 1922, according to the Hole in One Club. Chicago won first place with 52 aces, including three cuckoos made by women.

An electrically charged iron door will form part of the safeguards to King Tutankhamen's tomb while it is closed until next season. The terrific heat makes it impossible to work except during the winter season.

During 50 years John Wesley preached 40,000 sermons and rode 250,000 miles.

A power-driven track sweeper sweeps up and loads into cars the accumulated dirt—chiefly cinders, ashes and coal dust—which fouls the roadbeds where pusher locomotives are used. It operates at about four miles an hour and cuts the cost one-half where hand-labor was formerly used.

A Zionist syndicate is going to explore the Dead Sea.

Fresh ewe's milk is used in making the famous Roquefort cheese in the town of that name in France. The ewe's milk is delivered daily and after being filtered and allowed to turn, is pressed into molds and sown with the spores of a microscopic plant which assures its ripening or mellowing. After being drained the cheese is placed in natural cellars in the rocky hillsides where it is left from 30 to 90 days.

Because of the high freight rate in this country, American sales of flour in the Dutch East Indies have fallen to near the vanishing point. Our freight rates are more than double the Australian rate.

Czecho-Slovakia possesses a deposit of silica mineral of volcanic origin which can be used directly in the manufacture of glass without adding any of the common ingredients used in making up the glass batch. This mineral resembles lava and the deposits are very large.

Alcohol will be made from maize by a South African company inside of a year. Particular attention has been paid to the development of a motor fuel with alcohol as a base.

A cheap and rapid process for preparing chocolate creams having very soft cream centers has been developed. By using invertase in place of acid the semi-liquefaction of the centers has been secured. The process will be patented and dedicated to public use.

Many gas poison shells have been washed up at Southport, England, and 10 of them have been removed by some unknown persons. It is feared that some damage may result if they are handled by persons ignorant of their dangerous nature and the authorities are anxious to trace them.

Gold is being mined in Germany for the first time in 300 years. Deposits of gold were reported in the Eder River near Korbach not far from Westphalia. It runs 44 grams of fine gold to the ton of earth.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?

That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

What Does Wilson Think and Will He Say What He Thinks?

Do Banks Give Credit, or Do You?

Our "Year Without a Summer!"

Records of Calamities of Other Times Should Point a Warning

CHRONICLER OF THE NEGLECTED TRUTH

Halfway Mark of Harding Administration Sees No "Pointing With Pride"

What the President Would Like to Know Best of All Is: What Mr. Wilson Thinks of His Successor

By A. R. PINCI

THE close of the fourth session of the Sixty-seventh Congress marked the first half of Warren G. Harding's presidential term.

There is in the air a sort of painful restraint.

Tersely, there is no pointing with pride and no viewing with alarm.

Followers of the administration in power are expected to shout the usual hosannas at the conclusion of each administrative cycle, but the most experienced ear has failed to register any unusual joyful vibrations, nor has there been any discordant note of dissent. Instead of the usual full-lunged bands playing different tunes simultaneously, it looks as if the musicians were quietly practicing new tunes for future use.

True, there has gone forth from Washington the promise that during the summer the President may address the nation in what was once the "swing around the circle," and this will lead the opposition to prepare for the usual antiphony, but until President Harding actually announces such a program it need not be taken seriously.

One can understand what the actual motive of party notables is in wanting the President to talk for himself. Yet it is undisputable that something is wrong somewhere, not with President Harding himself, nor with any one of his chief lieutenants, but with the administration as a whole. It is not so much whether or not what the Republicans have wrought politically or otherwise during the past two years is what the people wanted, but that no Republican knows, actually knows, that the people are satisfied. This neutral condition is much more disconcerting than outright criticism or hostility.

The Passing of Hays

A YEAR ago the writer stated in these columns that there was "not a finger's worth of applause and not a frown of hostility," and that the recent congressional elections would not be a judgment of the administration, favorable or unfavorable. Political leaders have on the whole attempted to refute that statement, both when made and since then. Of course, the elections *did* mean something, as will be shown, but not according to the ancient political syllabus, as two instances will prove.

In April, 1922, Senator Medill McCormick, informally discussing the general situation with me, was convinced that the election would be favorable, with several gains probably in sight. "We have them on the run," he said. It was interesting, if true, but signs were wanting while words were plentiful.

Before the election, John T. Adams, chairman of the National Republican Committee, did not doubt the forthcoming results. There might be a slight realignment or readjustment, he said to me, but that was all.

Senator McCormick, as one of the irreconcilables of 1920, boarded the Republican band-wagon because it is the only vehicle he is familiar with outside of his private motor car. He was one of the half-dozen conductors in charge of it then (but no longer) with Will H. Hays driving. He is riding, but he is no longer conducting. If anything, he is becoming more of a checker.

The farewell that Mr. Hays kissed in abandoning the Republican band-wagon when he shifted jobs has been forgotten by now, or, at best, it is not remembered. But it is just as well to recollect it. It was the first break in the Harding camp. It was not the extravagant salary that was tendered as bait that shook Mr. Hays from his driving bench, nor the presumed sanctimonious publicity that went with it. Mr. Hays did not need publicity, nor did he need the money, as he had plenty of the first and enough of the latter. The separation of "Will" from the President's political family was not in disorder; anything but. The President was consulted, after Mr. Hays had thought about the new job, and the G. O. P. paterfamilias gave his formal assent.

Why Did "Will" Quit?

BUT the separation was not as lovely, in the uncharted strata of politics, as it appeared. Mr. Hays organized the campaign, and this was successful, and Mr. Hays was merely the last of the original Harding group to go overboard. It would not have been so pointed, or so eloquent, had either Mr. Hughes or Mr. Hoover received the offer that befell Mr. Hays, and in the order named both men were much better fitted as arbiters, as well as arbitrators, of the movies. Neither Mr. Hughes nor Mr. Hoover meant anything to the Harding administration, in the opinion of those who had identified themselves with the campaign. They were virtually non-existent. Both are creatures of the President himself and not of the electorate or the electoral machinery. Although unofficial, Mr. Hays' political job was and is supreme.

But the other question was begged; did Mr. Hays quit because eight months of inside knowledge led to unsatisfactory conclusions?

Mr. Hays had been gone three or four months when Senator McCormick thought that the opposition was on the run, but one would like to know why, in the face of such predicted victory, the Illinois Solon was on the Atlantic ocean on election day. True, he had no actual work to do, even as the leader of the Senate Republican Committee, but why not tarry until the victorious had been counted in?

Mr. Adams, whose sun rises and sets with Warren G. Harding, likewise flirted with Neptune's waves at a critical period. Instead of standing by until the end of the congressional term, to observe and keep "an eye peeled," he sailed for Egypt late in January, to be gone two or three months.

What Does Wilson Think?

ORDINARILY the chairman of the national committee of the administration in power has found that the weeks immediately before and immediately following the mid-term Rubicon require his personal attention. He not only is supposed to keep in touch with the recalcitrant elements of his party during the last voting days, and even whip them into political line, but is supposed to out-Shakespeare the bard of Avon in singing the praises of accomplishments before the dull reverberations of the Vice-President and the Speaker's gavels have ceased. To the chairman of the National Republican Committee this knock closing the session is supposed to be a boost. But how could it be heard in far-away Egypt, some persons are asking.

Not that silence is not better, after all. It goes without saying that with no crowing on the part of the party in power there is less necessity for brickbatting on the other side.

There is food for thought in the fact that the Democrats have been chary so far with their antagonism. It is an unnatural situation. It violates many human laws—or rather, laws of human weakness. The restraint, therefore, is premeditated or inspired. By whom?

The Republicans endeavored to find out by their forcing the "Harding boom" last February. It was a ridiculous performance, since the President is not open for a "boom"; he carries it by right of possession.

But what President Harding would like to know is what ex-President Wilson thinks of President Harding.

What the Republicans, big and little, would like to know, is what the ex-President thinks of the past two years.

And, to cap the climax, what ex-President Wilson thinks of the past 24 months is what the Democrats, big and little, would like to know. And they don't know. It is odd, but it's so.

Mr. Wilson's silence is not routine taciturnity. What he has felt like saying and hasn't said is neither here nor there, but to keep from saying it has been an amazing feat. Few men under the same circumstances would have resisted the urge. How amazing can be better understood by the fact that his audience, in a non-political sense, is greater than ever. What he would say, non-politically, to a non-political audience, would at once become politics.

There is no doubt that while the Democrats are generally disappointed because their titular chief is so reticent and aloof, the Republicans are downright hurt.

It's Hughes and Hoover

FROM the Democrats' standpoint word has long been expected from Mr. Wilson because of the ex-irreconcilables who defeated him having compromised into a policy that, no matter how good, has nothing in common with that on which the campaign was waged. The Democrats would like to know what Mr. Wilson thinks of the "Wilson Republicans," a new breed, a numerous breed, a powerful breed.

To be a Wilson Republican is not anathema; and there are at the same time many Harding Democrats. In some cases they are twain. It is a bit complex to explain, but time will reveal what is meant by either, and they are mentioned now simply as a matter of record.

It is generally known, this is a rather complex administration. But it does not represent the Republicans who waged the campaign of three years ago. Some of those have been forgotten, others have changed their spots. The Henry Cabot Lodge of today is not the same Senator of three years ago; the same may be said of Colonel George Harvey, whose first speech in London is all that remains of pre-diplomatic personality, whatever this may be.

The reason for the Wilson Republicans is easily found; Hughes and Hoover, with Elihu Root in the offing. The latter might object to being classified as a W-R, but despite his ingrained G. O. P-ism, in international relations he has remained an admirer of President Wilson, and except superficially he has had no love for the irreconcilables of the Republican party. He has been the real Nizam both in the Limitation of Armament conference and the Permanent Court of International Justice at The Hague. Both are related to the League of Nations, if not by nativity then by resemblance. Mr. Root was for the League; so were Messrs. Hughes and Hoover. The reservations did not amount to a hill of beans, politically. So we have the Wilson Republicans.

Both Hughes and Hoover, outsiders during the campaign of 1920, are now the directing forces at Washington. It would not be too much to say that they are assistant Presidents. Divested of its Wilsonism, Senator Lodge, embracing the new statesmanship, likewise has become a Wilson Republican, even though he may not suspect it. What is going to happen if President Harding actually intends to go before the country upon the Permanent Court of Justice issue, because of the Senate's lukewarmness toward it, is to stir up another hornets' nest, and by the time everybody has raced for cover some strange sets of political bedfellows will be ready for public inspection.

The merits of the international court are for the President to explain, of course, and it remains to be seen if he can logically and consistently square his campaign with his administration, and, of course, the people in general are more interested in administration than in campaigns.

But should he put it through, he will then be confronted with the League of Nation's ghost. He may profess not to see it; in fact, the whole G. O. P. may not believe in ghosts, but one thing is sure as tomorrow—that Mr. Wilson may have something to say this time next year. What he will say will go a long way. What that will lead to is another story.

Wilson Attitude Worries

MANY a Republican has been worried because the disarmament conference, of tender memory, brought no encomium from Mr. Wilson. At first they sort of expected a calling down; then they hoped for praise; now they wonder if its failure will be its best political handle in the opposition's hands.

It is possible, of course, that Mr. Wilson may not say anything. His attitude, however, is worrying the political bookmakers.

Here is Mr. Harding, bitterly anti-Wilson in his senatorial days, relying upon Mr. Hughes, as his Secretary of State, to lead him out of an international chaos which, in 1916, the latter was quibbling about against Mr. Wilson as part and parcel of that presidential campaign, yet with Mr. Wilson finding his erstwhile political opponent practically in hearty accord with him over international fellowship. But as if that were not all, there is Mr. Hoover who throughout the war was Mr. Wilson's favorite and most popular assistant, without exception, and in turn the same gentleman is recruited by President Harding to lead him out of a labyrinthian channel to the elusive port of Foreign Trade. No doubt about Who's What.

One thing is obvious, however. President Harding stands alone, as chief executive. He must stand or fall upon his own record. The people are not giving a picayune for his best minds, any more than they gave for Mr. Wilson's few "best minds." He has consistently tried to spread his administrative duties all along the line, but he will find at last accounts that if his best minds perform any miracles the people may fail to accord him recognition for them.

Officially, the 1924 campaign is not due to start until the spring of next year, but actually the first guns have already been fired. Whether the Republicans have played into the opposition's hands by being premature with the Harding boom is quite likely, because it has all the earmarks of their hastening to the defensive.

Extra Session Likely

IT IS more than likely, despite refutations, that President Harding will call the next Congress into extra session after the summer season. That is the feeling that every prominent politician entertains, and it is logical. The next may as well be considered a short session, because the political conventions and their results will be more important in the view of legislators and their cohorts than legislating. Moreover, their legislative program must be complete before convention time either to brag about it or to condemn it.

With the ship subsidy bill duly buried, the Permanent Court of Justice bill will take its place. This will lead to a realignment of forces. But a majority is problematical. Unless Congress meets in extra session it will be hardly likely that so complex and politically explosive a subject can be pushed through to success or defeat.

During the next few months President Harding will find that fewer great minds, and more of his own, will be the solution to many difficulties. There is a peculiar irresponsiveness between the people and the administration, even though the President is not the definite object of it. The President will be obliged to be his own spokesman and campaign leader if he wishes to restore some of the lost contact with the silent electorate.

And the silent electorate is growing in proportions.

On the Picturesque Streets of China's Capital

Colorful Indeed Are the Processions That Feature Life of Peking's People

By E. GERTRUDE BEASLEY

HATAMEN street was our first rendezvous. The ricksha boys wheeled us through a crowded and dusty street past dingy shops to the south, toward Hatamen Gate. We came on a tea house, the outer part made of paper in elaborate designs and colors—a tea house where the dead is supposed to stop and receive the feast offered by friends. This was not a "rendezvous with death" but a near approach to it, a "rendezvous with a funeral."

The funeral on Hatamen street was an elaborate one. It was a burial celebration of the wife of a Chinese general.

A long line of beggar children and those of the lowest order, with long white strips of paper inscribed in Chinese characters, attached to bamboo poles, headed the line of marchers which was probably a mile in length. These children were clad in dirty robes, once bright-colored, whose hems at times swept up still more dust as they passed. Then, there were priests in white garments and white caps; grown-up beggars holding aloft a series of elaborately decorated tablets bearing Chinese inscriptions; a long line carrying wreaths of variegated artificial flowers; and those carrying the fife-like instruments whose shrill note impresses one singularly on such occasions.

But this is not to be a "dead" story; on the other hand the street in Peking is radiant with life, in spite of the fact that so many of the gorgeous processions are for the dead.

The bride's dowry on its way to the house of the groom.

The head of the wedding procession.

The image pavilion and lion used in the funeral procession.

The usual scene about Hatamen Gate consists of some such picture as this: small two-wheeled carts piled with everything from lumber to vegetables, drawn by donkeys or what appear to be unbelievable mixtures of the equine family; and water carts which endeavor to quell the dust of the great thoroughfares of Peking, though more often a large wooden pail is seen, at which a man stands with his ladel or large wooden dipper quietly choosing his opportunity to throw out a spray of water between the multitudinous traffic and pedestrians.

In the din of ricksha coolies shouting to one another for space to pass and the populace being jostled about now and then by a more modern and lively motorized vehicle, there come along, rooting and grunting, a most abject herd of what are better known in Arkansas, let us say, as razor-backed swine. No sooner have they passed the crowd ebbing and flowing about the great gate than one beholds a fine line of camels sagging with their packs and "carrying on" with that same shaggy rhythm peculiar to the favorite beast of burden of the Orient.

One of the many wells in Peking. The water from such a source is used for watering the street, for washing purposes, or for watering the animals.

Out of this din emerged the funeral procession. Besides the bier, the mourners, the ragged beggars carrying the usual funeral paraphernalia, there were those carrying large white birds looking like swans (though they were in fact representations of the stork) the feathers having been made of white paper; the stuffed deer with its high antlers, the bodies being covered with small sprigs of pine making up the deer's coat; and numerous other stuffed images and representations in paper. All of these things are said to be desired by the dead. Interspersed among these objects prepared especially for the dead are numerous funeral umbrellas. At least I judged they might be called such, for there were many poles being carried by the funeral attendants with an umbrella like top around which hung gorgeous brocaded tapestry or colored silks beautifully embroidered

To the Chinese, this umbrella which is known as the *liang san,* is a relic of the days when royal attendants held it over His Imperial Majesty as he went about from place to place. But perhaps most interesting and certainly most archaic and emblematic of ancient oriental superstitions is the image of the mythological lion which sits on the image pavilion in which the spirit of the dead is said to be enshrined. The lion is made of the usual pine tree foliage and paper.

Then there is the wedding procession to be seen in the streets of Peking. The long line of attendants in their usual dark costumes with the circles of white dots is a more startling spectacle because of the array of gifts which they carry. The procession, with the bride's dowry, is indeed a thrilling sight with the beautiful gifts in full view. Fancy the pride of the groom on receiving such an array! There was everything from wearing apparel to furniture being carried in the dowry procession; pictures, vases, linens, in fact, every portable object of *la chambre* was to be seen.

One must see the long line with the red sedan chair in which the bride sits while being escorted to the house of the groom to appreciate the contribution which the wedding ceremony adds to street life in Peking. First, the procession is headed by those carrying long red poles with lanterns set at the top and decorated in gorgeous colors; large fan-like decorations are also set on poles, this being a custom of the old Manchu days; and most spectacular of all is the *liang san.* At the wedding procession these umbrellas appear more gorgeous than ever with their beautifully embroidered flowers of yellow and pink on a background of red, with a fringe of gold.

The head of the wedding procession is very gorgeous, but is not to be compared to the escort of the Hun Ch'iao or Happy Chair in which the bride sits. The sedan chair usually requires eight men to carry it, each in the special costume used for the occasion. On this particular day they were in white trousers, red jackets and large black fur hats. The chair itself is *très magnifique,* being entirely covered with the most exquisite brocades, embroideries, fringes, and tassels, of rare and unbelievable combinations of color.

When the bride has entered and the door is closed the chair gives the appearance of a gorgeously decorated small temple or shrine, possibly on account of the temple-like roof with the hangings about the edge. But, perhaps you would like to see the happy face of the bride. (Sometimes oriental brides appear very sad.) This you cannot do, for the doors of the Happy Chair are closed and when the elaborate curtain is drawn at the front she is completely hidden from view

Rosalsky Would Deport Hilaire Belloc

IT IS disappointing to have to record that the Jews have insulted another distinguished visitor to American shores, without a single Jew rebuking the makers of the insult. Hilaire Belloc, historian, litterateur, publicist, came to the United States on a legitimate errand, namely, the meeting of hosts of friends and admirers in this country, and he is hailed on his arrival by the demand of Judge Otto A. Rosalsky that he be deported. "Hilaire Belloc should be deported," said Rosalsky. "The United States Government blundered in permitting him to land. If he persists in his attempts to produce race prejudice here, the quicker the United States Government takes him by the neck and throws him back to London as an undesirable alien, the better it will suit me." (The quotation is made from the Jewish press.)

We are not here concerned with what Rosalsky says. Any remark about "undesirable aliens" is richly humorous, coming from him. THE DEARBORN INDEPENDENT makes an offer to print the facts about Mr. Belloc and the facts about Rosalsky and leave it to the public poll which man should be deported—and we promise as a result that "deport" is a word Rosalsky would never lightly use again.

What we are concerned with here is, that no Jew in New York has rebuked Rosalsky, but like the insults heaped upon Chesterton and the physical violence offered to Paderewski, this latest outrage has been allowed to stand as the Jews' act and attitude.

Chesterton came to the United States and was prohibited from delivering his best lecture on "The New Jerusalem." Lovers of good literature should read Gilbert K. Chesterton's book, "The New Jerusalem." It is published by George H. Doran. Belloc will probably be muzzled in the same way. Just as our sea doors are guarded by hosts of Jewish immigrant agents who facilitate the entrance of their own people and hinder the others, so are our channels of publicity interfered with by the same race. And distinguished visitors to foreign countries go home and report the United States as the one enlightened land where Free Speech is killed.

Mr. Belloc wrote a book called "The Jew." It is published in the United States by Houghton, Mifflin & Company, known to all as a firm that would scorn to give currency to "anti-Semitic" literature. Mr. Belloc discusses the Jewish Question frankly and fairly. He makes one mistake, but it is not a mistake of fact: he proposes a solution. They have him there! The solution must come from the Jews. It would have been an earnest of their competency to solve their own problem had some one of them rebuked the insulters of Mr. Belloc.

As for Mr. Belloc, doubtless he understands. His chief impression is likely to be one of surprise at the suppression of free speech in the United States.

Famine Is Over

SUDDENLY the famine clamor has subsided. In a day the word went round that no more foodstuffs were needed in Russia. It is welcome news however late it may be in coming. The food forces of other lands were drawn off long ago and put to other work—for these great organizations do not disband, they look for another propaganda field to cultivate. Where the Russian relief army will appear next is unknown, but it is pretty certain to be employed in some political purpose closely allied to the interests that have directed them heretofore.

It is announced now that it is better to send money to Russia, than food. It is another form of charity but will provide a better income for the government by stimulating business. The food is in Russia: it is now requested that money be sent that Russians may buy it from those who hold it.

Famines are strange occurrences, because it is so difficult to see one. In China, whose famine cries have sounded oftenest, there has never been an actual famine of food. There is always food on the great estates whose granaries are built on foundations 15 feet high, safe above the range of the flood waters. These granaries represent 80 per cent of the production of the country. A flood comes along, destroys the poor man's few yards of plantation, but leaves the rich man's stock. Immediately America and other Christian lands sends millions of dollars to purchase grain from the rich Chinese to give to the poor. Let a shipload of American grain be sent to the poor, and the rich Chinese regard it as an unwarranted interference with their legitimate famine profits. He prefers American charity in the form of cash.

The world is not yet ready to bear the facts about this whole relief business. It would be sheer wantonness to freeze up entirely the thin trickle of the world's charity by exposing the great gaps between the propaganda and the reality. But some day a better way will prevail and the truth will come out in a helpful manner.

The Tariff Doesn't Create Business

THE shoe industry of New England has in the past been one of the loudest in its demand for tariff protection. The development of quantity production has to some extent placed a few manufacturers in a position to jest at the persistence of those who fear foreign competition, but join with them in lobbying for free raw material.

In discussing a strike at Haverhill, Massachusetts, in which five manufacturers are said to contemplate removal rather than attempt to meet wage demands, *Shoe Topics* advises the men to accept a lower scale rather than lose their jobs. As to the merits of the dispute, *Shoe Topics* admits it has no information, and, of course, we have none. But as to the effect of a settlement on the basis urged it is patent that the necessity for closing down cannot be removed, if it exists at all, by any reduction of wages, or even by securing free labor.

Oddly enough, the same editorial corroborates this statement in an admission that the market for shoes will care for but 60 per cent of normal capacity of the factories, and that only the strongest organizations can expect long to survive. This means, of course, that but three in five of the men advised to accept wage cuts can expect continuous work in any event.

The over-stimulation of some industries until production far exceeds consumption may account for labor troubles to some extent, and often over-stimulation is induced by a high tariff, which may tempt unwise investment. It is natural to go into apparently profitable schemes, until profit is lost in competition, or maintained only through combination. Either is a case of business stupidity.

Next Generation Is Paying

IT IS said that half the present population of Germany is 23 years and under. That means that in 1914 those now comprising the German nation were 14 years old and under.

Here is an illustration of the irony of fate: a nation of children laden with responsibility, both moral and financial, with nothing whatever to say about it, with indeed no right to say anything even though they were given the opportunity.

The world has been talking about the unfairness to the future which is involved in these actions of the present generation. But in this instance there is no need to theorize about a nebulous future. That future is here. We have seen in our own day a nation of children grow up into the yoke prepared for them by forbears who are not all dead as yet.

The kaiser sees the babies of 1914 bearing the burden of his incapacity.

The world itself is trying to load these babies with burdens grievous to be borne.

It is still not quite politic to speak a word for the human part of Germany—the human part as distinct from the political or military parts. But this fact of the boys and girls of 1914 being the "Germany" with which diplomats are now dealing, is surely an arresting fact. It is big with significance for any thinker.

In the House of Its Friends

THE most severe critic of the Federal Reserve System could hardly have delivered a more telling blow against it than was administered in the house of its friends by J. H. Newvahner, president of the First National Bank of Jackson, Ohio, in an address before the members of Group 4 of the Ohio Bankers' Association, at Portsmouth.

Taking a position as a friend and advocate of the system, to which he gives full credit for saving the United States from nobody knows what dire calamity during and since the World War, Mr. Newvahner insists that his criticisms are constructive and for the good of the system itself and must be taken in that spirit.

In this speech the faults of the Federal Reserve system are clearly pointed out by the chief of a bank which is a member by compulsion. He calls these faults "weaknesses" which should be corrected—although the correction would be dependent upon the very administration which is responsible for their existence.

Mr. Newvahner's first point, conceding his opinion that a central reserve system is needed, will appeal to every citizen. *It is that the system should be run merely "to relieve distress and not for profit."*

Calling attention to the fact that in the first four years of the system its business was not large, the banks were able slightly more than to pay expenses and dividends, but that in 1917 the Federal Reserve banks cleared 18 per cent on their average capital, in 1918 they made 72 per cent, in 1919 they made 98 per cent, and in 1920 they made ONE HUNDRED AND SIXTY-ONE per cent, he protests as do all who have been compelled to bear the burden of depression and distress that has accompanied this most highly protected form of financial piracy.

This flood of profits, says Mr. Newvahner, justly, led to untold extravagance in administration, and he severely criticises the expenditure of $80,000,000 in new bank buildings, the establishment of branch Federal Reserve banks, the increase in number of employes and the giving of large salaries.

Let us digress here to suggest a point of especial interest to the public which the speaker may not have thought of or may have considered without relevancy in his remarks. Of every dollar of extravagant or useless expenditure NINETY CENTS was not the property of the Federal Reserve System, but was the money due the United States as a franchise tax for the privilege of doing business. If $80,000,000 has been spent for real estate now owned by the Federal Reserve System or the Federal Reserve banks in their individual capacity, they have invested but $8,000,000 for it. The people at large have paid the other $72,000,000. *This fact cannot be controverted.*

Mr. Newvahner proceeds to demonstrate with convincing clearness the injustice which results from shouldering the burden of this extravagance on the country banks. He also challenges the policy of the system in assuming the function of discounting and purchasing bills in the open market as an invasion of the general banking field in competition with its own member banks and those outside the system. He is also opposed to par collections as removing from individual banks a source of considerable revenue.

These latter matters are purely of a professional nature, and concern banks rather than the public.

The last criticism, however, relates to the autocratic coercion applied to state banks which do not become members and to small banks within the fold. In this matter the administration of the Fourth District Federal Reserve Bank, in which jurisdiction Jackson is and of which the First National is a member, is a chief offender. Readers will remember the story of the intimidation of the Catlettsburg bank and the scoring which the Cleveland Federal Reserve Bank received at the hands of the Federal Judge.

Does it not occur to a man of President Newvahner's independence and thoughtfulness that the best way to cure the evils is to make the United States Treasury the reserve agency, government bonds the basis of currency, and leave the banking business to all incorporated banks. That is, to do away with extravagance and useless expense, liquidate the Federal Reserve System.

Mr. Ford's Page

FEW things are more engaging of one's sympathies, more drawing upon one's experience, than the wrestling of young restless souls with the problems of their careers. There is something almost pathetic in the wistfulness and the demanding eagerness with which those who are about to enter upon life challenge us to give the word of counsel, the word of advice which shall solve their problem.

Whether the young man and woman really believe that anyone can solve the problem for them, is a question. Perhaps somewhere in the background of the mind there is a sense that the best any friend can do is just to let the problem be brought out and turned around in discussion. But what every mature person knows is this—none of us knows enough of all the elements involved to give sure counsel in personal matters.

The report of experience and observation is this: oftener the career chooses the person, than the person chooses the career. To one who makes himself, there are a thousand who are made by circumstances they did not foresee. "There is a destiny that shapes our ends."

This does not mean, of course, that we are the sports of fate. It may mean that, deeper than our intellectual conception of what we should like to be, there is a spiritual direction toward what we were meant to be, and in this sense what we were meant to be is usually just what we are; we would not be anything else.

The whole question is suggested by two persons who were recently seen. One has come late to his career. For nearly a quarter of a century he has kept himself ready to use his opportunity when it came, and for a quarter of a century it seemed to him that his opportunity would never come; there were months when it almost seemed that the quest would end in heartbreak. The glow had gone, the vision had vanished, nothing remained but sheer grit—then the opportunity came, and the man was ready to embrace it. Of course, it had nothing of the halo about it—for him—that it might have had 20 years before. To the world of onlookers there is a great thrill in the story, but not for him; he knows by what painful steps he toiled up to it, he remembers how often he was on the verge of letting go, how often indeed he did let go but was carried on by the sheer momentum of his effort. It all makes for modesty and sincerity in him, but it is very different from what the onlookers conceive it to be. Behind the scenes, actual success is a very plain experience

EXPERIENCE is the harvest of life, and every harvest is the result of a sowing. The experience which young people most crave is that of success in some service for which they are naturally fitted. And they wish it at once—immediately. Youth wishes to touch a magic button and command success without apprenticeship. But nothing ripens that is not first planted, and the very desires, the impatience, the dreams, the ambitions of youth are by way of a planting which shall come to fruition—sometimes after these desires are abandoned and forgotten. For the sown seed goes on growing whether we remember it or not. The wisdom of life is to keep on planting. Some men never plant after youthful imagination dies, and they reap only the one crop which they planted in youth. Plant every season and life will be a succession of harvests.

The other person is young, high spirited, brilliant with the new ideas and the modern vision, restive and impatient, believing that there must be some secret spring which if discovered and touched would, presto! bring about the desired success in service. Not at some future time, but now—bring it to pass next week!

It is rather difficult to say to such a person—probably it is unnecessary even to try to give youth a glimpse of middle-age experience—that all this straining at the tether, all this brilliant impatience, all this generation of high effort, is not solid performance at all, but practice, training. The efforts which seem so real, so final—to describe these as only the prancing of the impatient mind and not genuine progress sounds cruel in the ears of the one most interested. And yet he will know soon enough that what moved him most within himself was after all a sort of mental or spiritual gymnastics, not actual progress or production. These motions of the mind, these anxieties can be so intensely real while they are transpiring, that it is a trifle disconcerting to look back and discover that the entire meaning was interior, that they had no discoverable exterior relation at all. They mean something, but their meaning is not so immediately recognizable as a cooler motion will be in later years

In the deep, unwritten wisdom of life there are many things to be learned that cannot be taught. We never know them by hearing them said, but we grow into them by experience, and recognize them through understanding. Understanding is a great experience in itself, but it does not come through instruction.

And one of the matters which we understand and which may perhaps be reduced to words in such a form as to help those who are on the brink of life, and those who are wondering why things do not immediately respond to their imperious command—one of the elements of experience which may perhaps be passed across from the more mature condition to the less mature condition is this: Life is a series of plantings, and what your restive desire may be planting now will take root and grow and come to flower at a time when it may be you have forgotten that you ever planted it.

Of the two persons referred to, one was reaping his earlier plantings, the other was just beginning his planting and wondering why he could not immediately go in and reap a harvest. What a man sows he shall reap—it is not a threat, it is a promise And earnest, ambitious people are sowing all the time. One of the surprising qualities of life is that men reap things they have forgotten they ever sowed They planted the seed of desire and expectation, but because they did not immediately see the fruit they grew weary of waiting and turned their attention elsewhere; but the seed was a living thing and grew—forgotten or not, it grew, and in due time it came to flower and fruit. People are always being surprised by the fruition of forgotten planting.

The impatience of youth is probably a ruse by which Nature or Destiny, or whatever you may wish to name it, induces young people to plant. Deep in the soil of the mind are being planted the most vigorous seeds which nothing but the most active interior antagonism can prevent ripening. Fear and doubt are bad because they chill and devitalize the growing seed.

There are people who seem to be having plans come to maturity all the time, who seem to have a succession of fruitful ideas, and this can hardly be by accident. It is true, of course, that some soil is richer than others, but all kinds of soil yield to cultivation, and no soil however rich can produce where no seed has been sown. So that when you see many crops coming to one person you may be sure that there have been many plantings

Housewives who garden have a way of planting their flowers with the calendar in mind, they provide for blooms through every month of the spring, summer and autumn. Some gardens bloom once, and once only, because there has been only one kind of planting. Some lives come to one achievement, one success The boy wants to do this one thing, and in time there comes about the right combination of circumstances to enable him to do it But that is all. Planting has been stopped, and so there are no more thoughts, expectations, desires and plans coming to fruition

Dreams come true when they are real dreams planted in the sensitive soil of life. Whatsoever a man thinketh, so is he—not merely as a matter of character, but as a matter of ability and achievement. Thinking is the planting. That is one of the meanings of prayer—it is the planting of a desire, and is often answered a long time after it is forgotten.

It is the element of time of which we are most impatient But these great unfoldings require time. Time is part of the elemental forces which go to the ripening of our planting. It is the finest kind of future security to know that you have planted enough already to fill the next 20 to 30 years with fulfillment Give way to your natural genius, plant lavishly, and if you don't give up in the meantime, you will surely reap

A volume of 340 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals" will be sent postpaid for $1.00

St. Augustine—Our Last Spanish Landmark

Our Oldest City Is Quaint, Curious and Entirely Different From All Others

By GEORGE H. DACY

OUR oldest American city, founded in 1565 by Pedro Menendez, a Spanish explorer, with her tortuously winding streets, some of which a large man can almost span with his outstretched arms, with her overhanging balconies which almost bridge the thoroughfares, her quaint types of architecture and curios of historical importance, stands out in welcome contrast to the general run of our municipalities. One visiting St. Augustine can easily imagine himself in a coast city of Spain. The folk who in the years since 1600 have lived in our patriarchal port have adhered to the Spanish types of architecture. But for the fact that practically all the persons met converse in English one would be inclined to wager that it was a vista of Barcelona disclosed to the eyes.

St. Augustine presents a picture so beautiful as to tax the powers of description. Palm trees, poinsettias blooming, profuse displays of tropical plantings, an architecture which blends with the wealth of verdure, historical places that grip the imagination—that is St. Augustine.

It is a haven, far removed from commerce and industry, a kind of city by the sea which perhaps you did not think truly existed. Facilities for practically everything in sport have been provided and the tourist need not have an idle hour.

There are two private clubs with 18-hole courses and one municipal nine-hole course which fronts on the harbor. There you can stand, close to the fortifications of Fort Marion where Spanish soldiers centuries ago wielded arbequs and hot shot against the enemy, and manipulate your brassy or mid-iron to your heart's content. After golf you can idle awhile with a fishline on a municipal pier, to yank an arm-size piscatorial treasure from the smooth, placid waters of the bay. Next you may step across to your neighbor's lawn and engage him in a game of roque, croquet or quoits. The homely game of horseshoes, or "barnyard golf," has even penetrated to St. Augustine and won adherents among the thousands of pleasure-seekers.

Good shell and brick roads extend from the city and motoring is delightful. The five-mile trip to St. Augustine Beach on Anastasia Island sooner or later attracts every automobile owner, for on the hard, sandy beach at low tide, the motorist can roll along over the finest natural boulevard imaginable. There are, of course, opportunities for surf bathing when the weather is warm, although as a rule St. Augustine is considered a little too far north for regular plunges into the ocean during the winter months. There are natatoriums which provide amusement for the swimmers when the ocean water is too cold. Promenading along the sea wall has hundreds of daily adherents. To be outdoors as much as possible apparently is the ambition of every visitor who comes South. More than 70,000 automobiles bearing foreign license plates and carrying more than 250,000 tourists have passed through the Jacksonville gateway to Florida this past winter and have stopped over in St. Augustine to see and exclaim over the wonders of that ancient city.

At successive periods the flags of four different countries have flown over the governor's palace in St. Augustine. On four occasions, the city has been sacked and burned. Each disaster was capitalized in the gradual improvement of the revised and remodeled city which sprang up after each conflagration. The city has preserved its antiquity. None of the new buildings contrast sharply with the old. During the early era of strife between the French and Spaniards for supremacy in Florida, St. Augustine was really a headquarters, first dominated by one and then by the other power.

The first Europeans to visit the vicinity of what is now St. Augustine were Ponce de Leon and his notable expedition who sought the fountain of perpetual youth. They passed in 1513, hurrying again to sea after bathing in and drinking of the waters of every lake and pool in the neighborhood in their efforts to identify the marvelous "Bimini land" which they had learned about from the natives of the Bahama Islands. Ponce de Leon neglected to investigate the climate as a possible prolonger of old age. Notwithstanding, old folk of today who go to Florida maintain that the fount of long life is really characterized by the warmth and sunshine of this tropical country which eliminates the rigors and sting of winter.

A half century after Ponce de Leon, Jean Ribaut and his coterie of Huguenot refugees stopped for a time at St. Augustine before establishing their colony at Charlesfort, South Carolina. Finally, in 1565, the expedition of Pedro Menendez established a permanent settlement at St. Augustine, built a wooden fort and named the town in honor of the saint's feast that was celebrated on the day of their arrival. The underlying purpose of the Menendez exploration was to rout the French from Florida and secure permanent possession of the new land for the king of Spain. Ultimately, this Spanish leader proceeded against Ribaut, slew many of his followers and sacked the Ribaut stronghold.

Several years later, Dominic de Gourges led a French expedition which during Menendez's absence descended on St. Augustine, killed most of the Spaniards and burned the town. This was one of the early fires which reduced the Spanish settlement to embers. In 1586, Sir Francis Drake, an English adventurer commissioned by Queen Elizabeth, captured, pillaged and burned St. Augustine and put to flight her Spanish residents. After the departure of the English, the surviving Spaniards returned and rebuilt the city. Things went well then for eight decades when Captain John Davis, another English adventurer, invaded the port of St. Augustine, burned the town and robbed the defenders of all their riches. In 1702, Governor Moore, of South Carolina, led another successful expedition against St. Augustine, burned the town and carried away much valuable booty. This expedition cost South Carolina 6,000 pounds. About a half century later, Governor Oglethorpe, of Georgia, tried to duplicate the South Carolinian's success but, after besieging the city for 38 days, he was forced to retreat.

Above—What remains of Fort Marion, one of our most famous historical fortresses.

Left—The pyramidal monument in the central park of St. Augustine is dedicated to the plaza constitution.

Below—St. Augustine is the one American city which has a stately city gate, a relic of other times.

The next event of importance in the history of the famous city occurred in 1763 when Spain ceded St. Augustine by special treaty to England. During the following score of years, while the city was under English rule, great improvements were made and St. Augustine was developing into one of the leading municipalities of the South when by amicable agreement, England receded Florida to Spain. Under Spanish rule, the city never progressed much. In fact, it retrograded after the departure of the English and it was not until Spain ceded Florida to the United States in 1821 that a permanent era of prosperity dawned.

The earliest fortifications defending St. Augustine were of wood and were destroyed as often as the town was ravaged and burned. When the Spaniards first took possession of the environments of Anastasia Island, they improved the primitive wooden fort which had been improvised by the Indians who previously had occupied the region. When this fort was destroyed, the Spaniards built a more pretentious stronghold which they called San Juan de Pinos. It was demolished by Sir Francis Drake. A century later, the supporters of Spain began to construct Fort Marion, whose ruins are today an outstanding attraction to tourists and visitors. It is the most picturesque fortress standing on American soil. If the coquina rocks of which it is built could talk they could tell stories of inquisitorial tortures, sieges and military achievements, the like of which have never been excelled in the chronicles of American history.

Work on Fort Marion, or San Marco as it was then called, began in 1592 and was not completed until 164 years later. The arduous labor was performed by slaves, Indians and prisoners of war—many worked handicapped by confining balls and chains. The coquina rock peculiar to Florida which obtains from the decomposition of sea shells and other crustacean fossils was used in building the fort. This rock was mined on Anastasia Island and carried on the backs of the captive laborers across a narrow causeway to the opposite side of the bay where the fort site was located. St. Augustine lies between the Sebastian and Matanzas rivers and by stretching a line of fortifications and redoubts between these two streams and linking them with the city gates and Fort Marion, it was comparatively easy for the Spanish occupants to make the city practically invulnerable as far as early eighteenth century attacks were concerned. In fact, Fort Marion has the honorable record of having successfully withstood the onslaughts of all besieging expeditions during its active service.

Fort San Marco cost so much that the King of Spain, after he had paid the last bill associated with its construction, said that to his way of thinking the fortifications must have been built of silver pesos and gold doubloons. The old fort is square with bastions at each corner. It has but one entrance in the middle of the southern sally port. In every respect, it is a complete medieval fortress provided with a 40-foot moat which surrounded the walls and could be flooded at high tide from the neighboring river. Automatic sluice gates were so arranged that they opened when the tide came in and closed as it receded. The entrance gate was protected by a regulation portcullis. The walls of the fort are nine feet thick at the base and about one-half

(Concluded on page 11)

The Ruhr District at Essen.

Germany's Passive Resistance in the Ruhr

New Form of "Warfare" Against France Which May Prove Effective

By WALTER M. WOLFF

A CORRESPONDENT IN GERMANY

MANY believed that if the Ruhr were ever actually invaded by the French, German blood would be set to such a boiling that a new war would immediately result. Others pointed out the fact that Germany would utterly collapse; that the peace of Europe would hang in the balance; that England would not stand for it; or that Germany would immediately call upon Russia for military help with which to drive out the invader, and so on. But Old Dame Rumor has disappointed us again, and quite brusquely at that. The truth of the matter is that the Germans are probably the coolest people on earth today. They have grown so used to war, suffering, privation, reparations, loss of territory, and so on, during the past eight years that the latest French maneuver is considered but another straw in the broom which is slowly but surely sweeping old-time Germany off the map of Europe.

When the French moved forward and began the occupation of Essen, Bochum, Hamm and other Ruhr centers of German industry, the rest of the world began to sit up and wonder what was going to happen. In Germany the movement of French troops evoked much consternation and universal protest. The act was considered a breach of the Versailles Treaty and wanton invasion of defenseless territory. Great protest meetings were held throughout the nation and the government sent a tirade of protest to all the tribunals of Europe. The people of Germany were one in disapproval of the latest French move, and we almost expected them to borrow some rifles, machine guns, and a few airplanes and start after the ambitious Poilus. It is interesting to note what has actually happened.

Has No War Material

THE long list of political parties in Germany are now fully united against the new invasion, but the Nationalists, or Right Wing Party, who still yearn and long for the return of the monarchy, are the most ardent advocates for active military aggression against France. For them the Versailles Treaty has never existed, and they spend most of their time telling their fellow men about the "Tag" when German arms will again oust the Frank from German soil. "Siegreich wollen wir Frankreich schlagen!" is their slogan. (Victorious we shall conquer France!) The center of activities for the Nationalists is Munich where many a demonstration has already been held by the monarchists under the leadership of General Ludendorff and others of the old régime. If it were for Munich and Bavaria to decide, or if the rest of Germany felt like Munich about it, Germany would be shooting at Frenchmen today much in the same fashion that Belgium did at the Boche when Germany invaded that country in 1914. But happily for Germany, three-fourths of the Fatherland is not built after the Munich school. Germany has learned many a thing since 1914, and she now knows perhaps better than all the world that no lasting good has ever come from the direct use of the sword and the machine gun. She is absolutely positive that this holds true in her case, at least, and so it is that only the "hot-heads" scattered about here and there desire to have it out with France on the battlefield.

It must not be forgotten, however, that the German rank and file still consider France their arch-enemy, and that if conditions were just right or worst came to worst, they would not hesitate to try to drive out the sons of "La Grande Nation" with whatever arms they could muster into service. But, as we have said before, the average German realizes the utter futility of achieving any good whatsoever through military resistance. He knows the odds are against him in whatever form he may care to consider the matter, and there seems nothing to do but to shut up and bear the grind. He knows that France today possesses the largest army, the largest fleet of submarines, and the largest number of aircraft in the world, and that any major resistance would be as silly as it would be disastrous. Of course, the militarists try to explain it that with the help of Russia, Germany could present a front formidable enough to drive the Frenchmen from her borders within a short time. Little do these war-enthusiasts stop to consider Germany's chances of accomplishing anything through such an action. They forget that any hostile move on the part of Germany would immediately give France the chance she has been waiting and longing for—that much-coveted march to Berlin! The battleground in such a war (were it provoked) would not be found as it was in 1914, far in front of the German borders, but would now be deep in the heart of the Fatherland. At a moment's notice 10 French armies could be at the gates of Berlin before the Germans knew what the row was all about. French bombing-planes could let loose upon German cities such a mass of gas and explosives that Germany would soon be mutilated beyond recognition.

But why talk about possibilities when there are none? Germany has no war material at her disposal to speak of—no tanks, machine guns, Big Berthas and other long-range guns, or gas equipment, and so on. She has no battle-planes, no ammunition nor ammunition factories which are not feverishly watched, no well-equipped army, no navy, no organization—nothing! Germany is actually, notwithstanding all opinion to the contrary, helpless and harmless in every sense of the words. She is prostrate at France's feet, far more so than was ever a conquered nation in ancient history, for all her colonies have been shorn from her and her vitals in the form of Upper Silesia and the Ruhr have been or are being eaten away. Added to all this the shattered condition of her finances makes even the most casual talk of war a wild dream which has not the slightest possibility of becoming fact.

But what in the meantime HAS Germany done? We know that she has no friends worthy of mention who care to help her out of her present dilemma unless it be Russia, and Russia has or will have troubles enough of her own. Germany is actually powerless and friendless among the major nations of Europe today. She is merely the shadow and skeleton of what she was in 1914. If you don't believe it just glance at the exchange thermometer for a moment. In 1914 the German mark stood at 23.8 cents, or about four marks to the dollar; in January, 1923, the mark stood at *54,000* to the dollar! And even should the Reichsbank artificially resuscitate the value of the mark for political purposes, the revival can at best be only temporary. The old German gold mark is dead just about as much as the old Germany of the aristocracy.

But what is present-day Germany doing to meet the present-day emergencies? How is she fighting off the clutches at her throat? How does she face a situation which means less food, less work, still greater distress, suffering and humiliation? Well, the Rhenish-Westphalian or Ruhr German, as well as every other German, has decided to declare a "passive resistance" on the invader. A new kind of "warfare," to be sure, but one which he hopes will break the French grasp, and frustrate the latter's designs on the very pulse of German life. To begin with, the Ruhr district is the dynamo of Germany—of Europe! It is a wonderfully complicated area enmeshed with railroads, mines, factories, blast furnaces, foundries and machine shops. Thousands of huge smokestacks belch forth black cloud-masses day and night. Armies of workmen know no other world than that which lies about the river Ruhr from Essen to Dortmund. Imagine Pittsburgh and the great industrial sections of our East, and you get a conception of what the French octopus has attempted to fasten his long tentacles upon. The axiom that he who holds the key to the Ruhr rules Europe, is all too true to elicit further comment.

Let Others Do Fighting

AND so Germany has decided on passive resistance. This means, of course, plenty of protest, propaganda and opposition, but THIS time she is letting the other fellow do all the fighting. The Ruhr German is saying something like this: "If France wants to use force, well and good. That is her business, not ours, and we cannot stop her. But in occupying our territory *she* takes the consequences for whatever happens, not we. So come on, Poincare, do your worst! We won't budge!" And here the "passive" resistance only begins. The Germans have begun to boycott the French. Stores, restaurants, hotels—in fact everybody in Germany—have declared themselves independent of French or Belgian patronage. Signs are posted up everywhere, "No goods sold to French or Belgian citizens," or "French and Belgians never mind! Keep out!" The Ruhr Germans, particularly, have assumed a very apathetic attitude. They condemn the Munich type of anti-French propaganda, but believe they have a weapon that is quite different, to be sure, but just as effective, if not even more so. They take it coolly, quietly, and easily. They just "lay down on the job," that's all.

Whenever a town is occupied by the French troops, the inhabitants retire or look on and allow their "captors" free reign. There have already been, however, serious clashes between French soldiers and civilians or German officials, and there is likely to be further bloodshed. The Germans claim that French brutality and lawlessness are on the increase, and that serious consequences may result if the persecutions are carried too far. But on the whole the attitude of the Westphalians is strictly passive. They say of the Poilu in their midst, "Let him take what he can get (without our help he will *get* precious little); you may count on it we shall in no way *help* him to get anything!" The Westphalian knows that active resistance is useless and thinks he may accomplish at least something by keeping quiet. He also knows that the French are helpless without sufficient personnel and equipment of their own with which to run the district with profit. He knows it will take many months of patient labor to move the intricate machines or get coal out of the mines in any kind of way *without him*. He figures the French will waste a lot of time and effort, and spend enormous sums of money in a locality where they will get little or no return. In the end, he thinks, the occupation will grow so burdensome that France will be glad to clear out and allow the Germans full sway once more.

Playing Last Trump

WE NOW confront a problem which seems plausible enough upon examination, namely, that it may actually be possible for one nation which lies prostrate at the feet of another nation to beat the latter at its own game—by a different method! The Germans can, if they wish, make a profitable working of the Ruhr interests practically impossible. Of course, the French may, in time, as a stroke of revenge, resort to sabotage and destroy in a few hours masterpieces of mechanical genius which it has taken years to develop, but such a procedure would most assuredly not be to the benefit of either nation.

France is playing her last and trump card. To date no coal is moving toward France (or to Germany either, for that matter), and the Ruhr district is in imminent danger of falling into a state of lethargy. Germany seems to have won the first round without striking a blow, but whether she is prepared for the longer battle—a battle of endurance—still remains to be seen. We may be sure, however, that the betting crowd isn't taking even money on it. The odds are heavily against Germany.

There seems to be no question but that France is justified in her demands that Germany "cough up" and show something more tangible than mere promises to pay. Hers is a fight for national existence among friends who have deserted her for the time being. But whether she will win out by force of arms or occupation against the measures of "defense" adopted by her enemy, the Teuton, is still choice food for mental percolation. We have heard that the pen is mightier than the sword; it may be in this case that "laying down on the job" will show greater results than steel helmets and machine guns. We have a feeler or two already pointing in this direction.

In the meantime France will probably keep on occupying German cities; the amoeba of French ambition will spread out and cover more and more Teuton territory. One thing remains sure: the German either cannot or will not realize that he owes a debt to France. Hence he fights today not as in 1914 with sword and bayonet, but with a "don't give a d——n" spirit that may cause France more trouble than kaiser and House of Hohenzollern ever did. And we know that when a fellow "plays possum" in earnest, it's a mighty hard trick to set him up on his feet and make him work for you. It's like the old story we used to hear about being able to lead a horse to water, BUT——!

When We Suffered "Year Without a Summer"

Chronicles of Other Times of Calamity Point Warning to Heed Signs That Come in Abnormal Weather Periods

> Job 38:33—Knowest thou the ordinances of the heavens? Canst thou establish the dominion thereof in the earth?

By HERBERT J. BROWNE

This is the second of several articles by Mr. Browne, taking up the dependence of crop conditions upon the weather and discussing the possibilities of a drought. Mr. Browne also offers a suggestion designed to do away with the possibility of famine.

CROP failures may come from any unseasonable climatic cause. Nature's balance may be upset from several directions. What has happened in the past is apt to happen again.

In the bed of the Ohio River below Pittsburgh is a rock exposed only at extremely low stages of the river and said to have been even partly uncovered only twice since white men have occupied the country. It carries the strange markings of some primitive pre-Columbian people and is believed to be their record of the river's fall during an extreme drought. The Indians of the Mississippi Valley had traditions of a drought and famine so severe that there was no grass for the deer or buffalo, which died of starvation; even bird life disappeared, the Indians themselves surviving only by living on fish from the depleted streams and the lakes.

A later and more definitely recorded year of calamity was 1816, "The Year Without a Summer." Various records have been preserved of this extraordinary period. Not only was it a year of sunspot maxima, but the year before Tomboro, in the island of Sumbawa, Dutch East Indies, blew up in one of the greatest volcanic explosions of modern times, filling the upper atmosphere with hundreds of cubic miles of fine volcanic dust, which in a few months spread all over the earth, lasting for three years, and in conjunction with the disturbance of the sunspot maxima intercepted enough of the sun's heat to account for the cold weather of 1816. No crops were raised even in Virginia. Potatoes, beans, wheat, rye and corn hardly got above the ground. There was no hay or pasturage, and farmers sold their livestock for a few dollars a head to the more fortunate ones who had carried over from the previous year a supply of hay and grain. Ice formed and snow fell every month in the year. While the East was well settled, the trans-Appalachian country was receiving its first strong impulse of hardy pioneers. Detroit was a small village and military post, St. Louis a French fur-trading settlement and Chicago still Fort Dearborn. The abnormal cold extended to the British Isles, Europe and even into North Africa. It may here be noted that 1762, 1816 and 1870, three seriously abnormal years, fit into the 55.6 year cycle of highest maxima of sunspots, that the dry year 1881 recorded nearly as many sunspots as the 11.11 year cycle of 1883, and that the next 55.6 year major cycle will fall in 1926-27.

The Record of 1816

THE most interesting record of 1816 is that of Charles Peirce, of Philadelphia, from which the following is taken:

April.—Mean temperature 47. Cold blustering snow storms; ice several nights. All buds and green things killed.

May.—Mean temperature 57. A frosty jade, her frowns many, her smiles few. Cold frosty nights, north winds. Buds and small fruit frozen. Ice ¼ to ½ inch. Corn replanted three times.

June.—Average temperature 64. Coldest ever remembered. Severe frosts and on one day ice. All restarted plants killed.

Six to ten inches snow in Vermont, three inches in New York, several inches in Maine and New Hampshire.

July.—Mean temperature 68. Frost and thin ice 5th. Ice as thick as window-glass in New York, New England and Pennsylvania. Grass destroyed. Very little rain.

August.—Cheerless and cold. Northeast rains. Ice ½ inch thick. Indian corn frozen. Newspapers from England say: "It will be remembered by the present generation that the year 1816 was a year in which there was no summer."

September.—Opened mild. Mean temperature 62. Frosty 17th. Severe Equinoctial storm, 23d. Then several days of freezing weather.

October.—Mean temperature 41. Cold, freezing; a few warm days.

November.—Mean temperature 41. Cold. Froze hard several nights.

December.—Mean temperature 32. Milder

History Tells of Cold Spells

PEIRCE records that December, 1815, saw more intensely cold weather than any December in 25 years, and that 1816 was also of exceptional severity in Europe, North Africa and the West Indies. Seed corn held over from 1815 sold for $4 a bushel on the cob in the spring of 1817. He also notes that the year 1762 had the severest drought on record in Pennsylvania, that scarcely a drop of rain fell from May to September, and that there were no crops.

The extraordinarily cold year of 1816 was a repetition of many such recorded since the beginning of the Christian Era. In 301 the Black Sea was frozen over, and in 401 not only the Black Sea but the Bosporus the Dardanelles and the Sea of Marmora, and again in 762. In 1384 the Adriatic froze. History records a startling number of weather catastrophes, the recurrence of which now, with population pressing more and more closely upon the heels of production, would menace the welfare of humanity. They have come oftener than once in a century, but it has been less than a hundred years since food supplies have been brought thousands of miles to the populous trading and manufacturing nations. And it is a singular paradox that so far famines have affected principally the agricultural populations of the regions where the droughts have fallen. It could not fail to fall heavily on the non-producing centers if it were to occur again in the near future.

How They Come About

LESS attention has been given by meteorologists to the causes of cold years, because their recurrence within the short period of modern scientific meteorological investigations has not been notable. But in the combination of unfavorable conditions will lie the explanation. Assume for two or three years dry summers and autumns in the lower temperate regions, with unusually heavy snowfalls in the high northern latitudes and abnormally cold arctic winters. The stage would then be set for cold late springs and a limited movement of the arctic ice fields. That in turn would develop arctic abnormal Highs and abnormal Atlantic and Pacific Lows. This would have the double effect of bringing up from the ocean depths beneath the subtropical Lows huge bodies of icy water and of causing numerous arctic anticyclones to sweep south all through the spring and summer in a series of cold waves. It does not require constant cold to destroy crops, but a series of killing frosts and freezes.

Conditions in the polar ice cap determine largely the location of the Aleutian Low. Let a warm winter be followed by a warm spring with the ice fields clearing into the Atlantic at an early date, the Aleutian Low will move well to the North and weaken until it is practically blended with the general field of rising arctic pressure. The Icelandic Low will follow suit, *and then both Atlantic and Pacific Highs will be found moving north of their normal stations.* In the United States warm currents will flow in and move far to the north. But the Siberian High is weakened, and its waves spread more toward the arctic, and what cyclonic Lows find their way into the American continent *are too feeble to work south of the Great Lakes and produce rain.* A great stagnant high pressure area will have taken possession of the country and a severe drought is on. The dry winds crossing the Rockies now sweep across the heated plains and burn the withering crops like a prairie fire.

Droughts Have Hit, Too

THE country has suffered from numerous dry periods, each originating in certain of the causes here outlined. Let these causes all be combined in a single assault, and the country would experience a drought of unprecedented severity.

The drought of 1881 was of wide extent. Abnormal conditions had appeared during the previous two years. December, 1880, was one of the warmest Decembers ever recorded, and January, 1881, the warmest east of the Rockies. The Canadian snow cover was thin and soon melted, confirmation of the theory that its early departure is a contributing cause of droughts in the States. During May the cool Lows, whose normal progress well south of the Great Lakes gives the saving rains, were drifting east above latitude 45, and the inevitable deficiency in rainfall which had begun in April continued until late September.

The entire country east of the Mississippi was under the spell, and during July and August Kansas and Arkansas were affected. In August, the Middle Atlantic states received less than one-third their normal rainfall, and the Ohio Valley less than one-eighth. By September the situation north of the Ohio and east of the Mississippi clear to the coast had become hopeless. Streams had fallen to their lowest stages and the crops were either killed or so badly injured as to not pay for the harvesting. A severe drought in July and August, 1876, extended from Maine to Virginia and west into Ohio with a rainfall of less than an inch. In 1886 the drought was marked in Northeast Dakota and Northwest Minnesota. During June and July the dry area included five other states with extensive crop damage.

The year 1920 saw the southwestern cattle ranges so stricken that the government had to intervene to aid in getting the cattle almost bodily out of the territory. The northwest grain belt fared nearly as badly.

Both 1920 and 1921 saw large areas of intense drought, and the latter year witnessed the failure of the Russian grain crop and the most destructive famine in the history of that country.

In the period from September, 1920, to July, 1921, inclusive, a light northern snow cover and early high arctic temperatures paved the way for droughts. The country filled with stagnant high areas and the arctic cyclones were too weak to dislodge them. The Lows were nearly 44 per cent above their average number, but this was the mark of a warm arctic whose signpost, the Aleutian Low, was far north of its proper place, or Atlantic and Pacific Highs moved to the north, and sluggish atmospheric conditions generally.

The year 1922 just closed is the third in succession of striking abnormalities and world-wide weather disturbances. The Russian drought of 1921 and a serious famine in China are included, with every country in Europe suffering severely during the past five years. Since the record of 1922 will have a strong bearing on what may happen during 1923, its record should be examined with care. Its first abnormality was the record-breaking snowstorm which swept up the South and Middle Atlantic states January 27-29. Richmond had 19 inches of snow, Washington 28, Baltimore 26, Wilmington, Delaware, 18, Philadelphia 12, and points farther north and east lessening amounts. *This storm finds repetition a year later* in the great gale which swept the whole length of the Atlantic coast the last week of December, 1922, crossed the ocean with increasing intensity, and ravaged the coasts of Western Europe, reported by many sea captains as the worst they had ever experienced.

The Cold Spells of 1922

FOLLOWING the January, 1922, snow came a series of winter thunderstorms ranging east from Milwaukee to New York and south to Washington. A severe glaze storm followed in the Great Lake region doing $5,000,000 damage in Michigan and $10,000,000 in Wisconsin. In March came the great cold wave which swept the citrous belt from California to Florida, with freezing temperatures as far south as Corpus Christi, Texas, the first time on record. A cold wave in May damaged fruit from New York to Virginia. The Gulf States saw the cotton crop seriously damaged *by excessive rains* all through the spring and early summer, and numerous cloudbursts were reported in many sections. Droughts are characterized by vagaries of intense local rains, or more frequently by excessive rains during the fortnight preceding the beginning of the period.

Drought sections of great intensity developed in Northern Pennsylvania extending north into New York. Similar conditions were reported in the Kentucky coal fields. The rainfall of the great grain states of the trans-Mississippi has been far below normal, and forecasts indicate that any further unfavorable developments will find the winter wheat plants too weak to make resistance. Severe droughts prevailed in the Great Plains and Rocky Mountain districts and Pacific slope, and the rainfall of nine-tenths of the country is distinctly below normal.

Arctic Warmer This Year

NOW comes an interesting report from the American consul at Bergen, Norway, issued by the Department of Commerce at Washington. He states that the Arctic Ocean has become much warmer this winter. Seals are retiring far north to the ice fields much beyond their usual grounds. Ice fields are disappearing, glaciers are melting in Greenland, leaving bare ravines and moraines never seen before. The whitefish have vanished and herring and smelt have gone north to take their places. Dr. Hoel, geologist of the University of Norway, has just returned from an arctic expedition and reports that he found very little ice and that his soundings to a depth of more than two miles showed the north arm of the Gulf Stream very warm as far up as 81 degrees 21 minutes, nearly 14 degrees inside the arctic circle. An arctic fisherman, he states, says that *it has been growing warmer in the arctic since 1918.*

Here has been set forth the record of three consecutive years of drought, high temperatures and marked abnormalities of rainfall, cold waves, heat and barometric disturbances. The year just closed has been the most marked of the series in its chaotic conditions, particularly in those which carry over their effects into the following year.

A District Where the Ballot Box Is Forgotten

House and Senate Committees Act on Legislation to Govern Washington

THERE are two proud moments in the life of the average American citizen of male persuasion. One occurs when he dons his first long trousers and fares forth before the envious eyes of his younger playmates. The other takes place when he attains his majority and becomes a member of one or the other of our great political machines, which every four years contend in a ballot box duel to determine whose candidate will occupy the White House. The youths of the District of Columbia never experience the big thrill, which comes when one first votes for a President. Our superb seat of government, capital of capitals and hub of national and international activities, is denied the right of franchise despite that it is populated by as intelligent, influential and typically American kind of folk as can be found in any city in the United States.

This land of the abandoned ballot box is different in many other respects from our ordinary communities. It is run by a commission form of government under the supervision of a congressional committee. It derives its annual quota of spending money from a so-called 60-40 system. At present, approximately 60 per cent of the annual expenditures of the District of Columbia —they amount to between $22,000,000 and $23,000,000 a year—are raised by direct taxation on the inhabitants, while Uncle Sam appropriates the remaining 40 per cent of the total. It used to be that a 50-50 plan was followed, but recently Congress made the change which imposes more of the maintenance burden on the persons who regularly receive their mail at some "D. C." address. A unique feature of District of Columbia taxation is that intangible property, such as mortgages, stocks and bonds, are annually taxed at the rate of one-half of one per cent of their face value.

The history of the Federal headquarters since its inception away back in 1788 has been most curious and reflects eras of interest, indifference and inactivity, followed by periods when all was animation and everybody was intent on developing the district and the city of Washington into the peer of all seats of government. The Constitution provided that the national capital should be located on a tract of land not exceeding 10 miles square, which must be donated by the 13 states that then composed our infant republic. After considerable discussion, it was decided that the southern states should present the land for the capital, while the northern states should assume the burden of paying off the expenses of the Revolutionary War. The South finally accepted the offer of Virginia and Maryland to give a tract of land bordering the east and west banks of the Potomac River. That was how the District of Columbia came to be laid out along the Potomac at a point 106 miles above the junction of that river with Chesapeake Bay. This area was then the approximate center of the 13 states and today the Washington Monument stands exactly on the center of what then constituted the United States of America.

Everybody was glad when our transient, floating capital was permanently moored in the District of Columbia.
